The congress of delegates of the recognised national automobile clubs was held in Paris last week. Although the meeting was private, it is stated that a good deal of discussion took place with regard to the classification in races of such engines as those of the Gobron-Brillie type and those working on the two-cycle

at passing motor-cars. The matter was discussed at a meeting of the Association Generale Automobile in Paris last week, when it was decided to approach the French Minister of the Interior, with a view of inducing him to issue a warning notice to be posted up in schools and outside public buildings.

Round the World by Motor-car.

The "Matin," of Paris, which suggested the Pekin-Paris motor race, now proposes to organise a motor trip from New York to Paris. The journey, with the exception of the small strip of water at Behring Strait, is to be made by land. The distance is nearly twice as great as the Pekin-Paris run.

Miscellaneous Items.

The Automobile Club of Milan is organising a competition of motor lamps, to be held early next year.—A company has been formed in Vienna to place Elastex-filled tyres on the Austrian market.—A company is reported to be in course of formation at Salonica, Turkey, to inaugurate a public motor-car service in that district.—A motor-car exhibition is to be held in Budapest from the 17th to the 31st May next.—The Dansk Motor Union—a union of all the motoring clubs in Denmark—has just been formed at Odense.]

THERE are about 400 motor-cyclists in Hull.

MR. G. BERNARD SHAW has become a life member of the Motor Union.

MR. T. FISHER UNWIN has just published the Ordnance Survey map of Huntington and also of Preston. The good features of these authoritative maps are generally known.

MR. T. C. SPONG, of Shaftesbury Avenue, W.C., is introducing a non-skid band, which has rendered good service. It consists of a fibrous band to encircle the tread of the tyre, and which picks up the grit of the road, forming a good non-skidding surface.

THE Hutchinson motor tyres are being kept well to the fore by the excellent handy map which the company is supplying to its agents from 13, Maddox Street, W. They are also issuing an admirable circular giving calculations for the proper inflating of motor tyres.

WE learn from Mr. J. B. King, 20, Lordship Terrace, Stoke Newington, London, N., that the Bombay Reliability Trials proposed to be organised by the Motor Union of Western India have been postponed to February 2nd of next year, owing to the shortage of the petrol supply in India.

WITH regard to the awards in the Commercial Vehicle Trials of the Royal A.C., confirmation comes of the report, first announced in the "Industrial Motor Review," that a silver medal has been awarded to the lorry with detachable sides entered by the Darracq-Serpollet Omnibus Company, Ltd. This was omitted from the first official list.

NAZARRO, the famous driver of Fiat racing cars, and the winner of the Targa Florio, Kaiser Prize, and A.C.F. Grand Prix events, was at the Fiat Co.'s stand at Olympia last week. On Sunday he had his first experience of motoring on English roads, while on Monday he made his acquaintance with the Brooklands track.

APPLICATION for the formation of a local centre of the Society of Motor Manufacturers and Traders, to embrace Nottinghamshire, Derbyshire, Leicestershire, Lincolnshire and Rutland, has been made. The seven necessary signatories are Messrs. Johnson and Co., King and Co., Ltd., Bennett and Co., Empire Garage Company, H. Belcher, Midland Counties Motor Garage Company, and A. R. Atkey and Co., Ltd.

IN consequence of it having been found that the bright red "Shell" motor spirit cans of the British Petroleum Co., Ltd., are being used for illicit purposes, *i.e.*, seals being removed and inferior substitutes filled into the cans, in future an adhesive label will be placed on the handles of the cans. All "Shell" motor spirit cans are sealed—the seal representing the trade mark—an escallop shell such as is well imitated in a new ash-tray sent by the company to impress the distinctive mark of the company on the editorial mind.

FROM the Mitchell Motor Works and Garage in Wardour Street, London, W., comes a new edition of their "Motor Roads to London," which was favourably reviewed on its first appearance. The book has been considerably amplified and is prepared in a handy form for the public. Metropolitan motorists will appreciate the map accompanying the volume, in which the main roads in and out of London are shown. To give them due prominence all minor details have been omitted, and this feature should be of practical value both to residents in and visitors to London.

MOTORISTS will regret to learn of the fire on the premises of Messrs. A. W. Gamage, Ltd., in Holborn, on Tuesday morning. Despite the heavy loss the head of the business with characteristic enterprise quickly got to work, so that the patrons of the Christmas bazaar should not be disappointed, and business in the motor accessory and other departments will be continued without appreciable dislocation. So great are the resources of the firm that although stocks were destroyed to the value of £20,000, replenishment is taking place as we go to press, and a thousand assistants as busily at work as though no such misfortune had occurred.

HERE AND THERE.

THE Automobile Association now has 5,000 members.

THE most comfortable-looking sandwich-men promenading the route to Olympia in the last fortnight were the Dunlop folks, clad in waterproof "plu" coats

and twill driving caps, and carrying enamelled iron discs and yellow cotton umbrellas—lettered, of course, with the name of the famous tyres.

FROM Messrs. Morgan and Co., the British agents, we have received a useful booklet giving full instructions as to the care and attention which must be given to the Adler cars.

THE "CHADDESLEY" MANUFACTURING COMPANY, of the Cookley Iron Works, near Kidderminster, showed some excellent stamped steel flanges for motor-car wheels at the Olympia Exhibition.

DESPITE the fog last week's sale by Messrs. Hampton and Sons on the Brooklands Motor Track at Weybridge was successful, a large gathering being present, and satisfactory business being done.

THE monument, which has been erected near the entrance to the Bois de Boulogne, Paris, in memory of the late Emile Levassor, one of the pioneers of the French motor industry, was unveiled on Tuesday last.

Mr. A. Clifford Earp on the 35-h.p. Iris on Solway Bridge.

[See page 860.]

PREPARATIONS for the Franco-British Exhibition at Shepherd's Bush next May are rapidly going ahead, and promises of support are being received from many of the leaders of industry both in this country and in France. The site selected at Shepherd's Bush covers 140 acres, and the various methods of transport available will be capable of conveying 75,000 persons to the spot every hour.

AN Argyll 10-12-h.p. two-cylinder car belonging to Mr. J. E. Young, a member of the Scottish Club, has recently accomplished a noteworthy fuel consumption trial under the observation of the R.A.C. The car in question is that which won a gold medal in the S.A.C. Glasgow to London event of four years ago, and has always possessed remarkable economy in petrol consumption. The trial to which we refer took place on the great North Road. A special tank was fitted to the dash, into which exactly one gallon of fuel was measured. On this the car completed 39½ miles on the outward journey, and on the return, under similar conditions, exactly 40 miles to the gallon. The carburettor was a Longuemare, having regulation of gas and air. A twelve-hole jet with two holes blocked was used with a No. 34 funnel and a Bowden auxiliary air inlet on the induction pipe. The petrol used was Borneo spirit of a density of .756. Although on some of the hills, when coasting, the engine was allowed to stop, the performance is a remarkable one, especially in view of the fact that the car in question weighed with its four passengers 2,578 lbs., and is about four years old.

THE Metropolitan Water Board are endeavouring to obtain a coin meter in connection with the supply of water to the steam vehicles in the London area.

THE Derwent Engineering Company, of the Central Square, John Street, Workington, have motor-cars on hire, and also undertake motor repair work generally.

SOME of the officials of the Garden City Association visited the Show at Olympia with a view of interesting manufacturing firms in the development of Letchworth.

WE learn that the Marquis of Villalobar has acknowledged King Alfonso's acceptance of a copy of Mr. Charles Jarrott's book "Ten Years of Motors and Motor Racing."

THE R.A.C. has issued a certificate to the London and Parisian Motor Company, Ltd., in regard to a 100-mile petrol consumption test, made on a 40-50-h.p. six-cylinder Hotchkiss car, on the 8th inst. The route followed was from the seventeenth milestone from London, on the Great North road, *via* Hitchin, and the car ran to the sixty-seventh milestone from London, where it turned round and came back over the same route, the distance run being 100 miles. Shell motor spirit was used, specific gravity .715 at 60-80 deg. F. The amount of fuel consumed was 7 gallons 2 pints, equal to 13.79 miles per gallon and 26.6 ton-miles per gallon.

THE Southall Compression Register has just been placed on the market by Mr. H.W. Southall, Jr., of 7, Union Passage, Birmingham.

This is a very useful device, enabling anyone possessing a tyre tester of any make to get a reading of the compression pressure in any engine cylinder with the minimum amount of trouble. The form of the Register will be apparent from the accompanying illustration. One end is fitted into the sparking plug hole, and the tyre tester on being fitted to the other end will accurately register the compression pressure. The device is well made and should have a good sale.

A TRIAL of Palmer tyres has taken place on the Brooklands track, the car being a six-cylinder 60-h.p. Thames (by R.A.C. rating 60-h.p.), cylinders 5 in. by 5 in., entered by Messrs. W. T. Clifford-Earp, Ltd., with the object of demonstrating that Palmer cord beaded-edge tyres, ribbed tread, could run at a high speed under non-stop conditions for several hours, the length of the trial to be approximately 400 miles; no fresh tyres to be used.

DURING the exhibition at Olympia the illuminated sign of the M.C.J., at the stand wherefrom the Journal was obtainable suggested to many motor agents a splendid means of attracting attention to their garages at night-time. This is automatic in action, easily fixed in position, and is being standardised by the Chameleon Signs, Ltd., 318, Dashwood House, New Broad Street, E.C., for the motor trades.

THE Mexican Government is reported to be establishing a special military motor service, to take the field against the marauding Yaquis, who after a raid retire to their desert strongholds. A number of special cars fitted to carry a Gatling gun, two gunners, forty gallons of water and a chauffeur, have been acquired, and with these the desert of Sanora, famous for its bandits and murders of mining prospectors, is to be rendered as safe as the American Death Valley is to-day.

THE early approach of 1908 is emphasised by the arrival of the excellent self-registering pocket diaries of Messrs. T. J. and J. Smith, who have long been identified with the publication of notebooks of most convenient form. Their special feature is in automatically opening at the page last written upon—a combination which has been produced in various forms, both for the pocket and the office desk. Those for office use are characterised by the excellence of the paper used, as well as by the convenience of the various arrangements, and, altogether, Messrs. T. J. and J. Smith have demonstrated their intention of keeping to the front so far as publishers of almanacs and diaries are concerned.

MESSRS. G. H. WAIT AND CO., of the London Road, Leicester, have introduced a scheme for the benefit of owners of Clyde cars in their district which should prove attractive. They are contracting to supply petrol, oil, grease, tyres, &c., and to do all repairs caused by wear and tear, and to keep their vehicles in running order for four years from the date of purchase on terms based on an average of 7,500 miles per year.

SOME tests have recently been carried out at the Napier Works on a standard 40-h.p. six-cylinder Napier engine with a fuel consisting of 90 per cent. alcohol spirit, and the results are sufficiently instructive to show that in such countries as India, certain parts of Australia, &c., where alcohol can be produced easily and cheaply, cars can run with the bulk of the fuel pure alcohol. With alcohol only the engine was difficult to start, so benzol was added until they were about in equal proportions, when it was found the engine started up well. With two parts of alcohol and one of benzol the engine was difficult to start, although warm, but when once started up it ran quite well on these proportions; the exhaust was much purer, too, than when half benzol was used. A further experiment was made with three parts of alcohol and one of benzol. There was considerable difficulty in starting up with this combination, but, after starting, the engine ran very sweetly. The next day, with everything quite cold, a mixture of two parts of alcohol and one part of benzol was tried, but the motor would not start up; equal parts of benzol and alcohol were then used, but there was still great difficulty in starting; finally the engine was started by introducing a few drops of petrol into each of the cylinders. The car was then taken for a run with five parts of alcohol and four parts of benzol, and this appeared to be about the correct mixture when running the vehicle in traffic slowly so as not to have any risk of the engine stopping; even with these proportions, however, the motor did not "pick" up perfectly until the parts got warm. As regards power, there was no definite bench test made, but it did not appear that it was quite so high as with petrol. The specific gravity of the alcohol used was .83, at 15.6 C., that of the benzol used being .875, at 15 C.

WE gather from information received from a large number of exhibitors that the method of doing business at this year's Show differs considerably from that adopted twelve months ago, and, in consequence, considerable misapprehension has arisen as to the reported number of orders taken at the Show. As an instance of this, the Humber Company tell us that at the 1906 Show many of their agents gave them orders for cars far in excess of what could reasonably be expected would meet their requirements. The agents so ordering obtained prior right to delivery, and when the stress of business arose in the spring the company had to refuse many orders for cars in consequence of their having been allotted to agents who ordered beyond their reasonable requirements. In order to obviate the possibility of this recurring, Messrs. Humber have made arrangements with their agents for next season that the full trade discounts will not be allowed unless they take the full number of cars contracted for. The consequence has been that the agents this year have been extremely careful in giving their orders; beyond this, many private customers of the firm and of the agents last year were induced to place their orders at the Show for cars, delivery of which was not required for say three or four months afterwards. This year it is pretty well understood that less difficulty will be experienced in obtaining early delivery, in view of the enormous increase in the power of production of the firm. This again has lessened the number of orders which otherwise would have been received. It is, therefore, extremely satisfactory to know that, notwithstanding the above facts, the contracts the Humber Company have received from their agents, coupled with the direct orders from customers this year, are far in excess of what they were twelve months ago. Whilst Messrs. Humber naturally do not care to disclose the extent of their business, we have every reason to believe that the firm hold already signed contracts and orders for cars to the amount of not far short of £500,000. Whilst foreign firms and many small English makers doubtless have been disappointed with the results of the show, this experience is interesting.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE ACTION OF CARBURETTORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—In reply to your correspondent, Mr. Sydney Wright, re the "Perfecta" carburettor, it has long been a questionable point as to whether a constant quantity of gas is the most desirable one. The Perfecta is adjusted to give the utmost power at all speeds, and perhaps it would have been better if this had been explained. Personally I think the mixture should be of fairly constant quality, for several motors have measuring devices, notably the Gobron-Brillié, which gives remarkably good results both as regards power, economy, slow running, &c., not to mention the fact that it will also work with petrol, benzole and alcohol. Several of the most successful heavy oil engines also have positive measurers, all showing that the mixtures are best when approximately constant in value. I know that on down grades very weak mixtures can be used, and also on other occasions when maximum powers are not required, but in these cases nothing is of any use but a hand-regulated extra air valve.—Yours truly,

FRANK SMITH.

THE WORLD'S RECORD FOR RELIABILITY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—Captain Corbet claims this title for the Hotchkiss car on the ground that the time and money spent on its adjustment or repairs

It appears to me that no claim for the record for "reliability" on the ground of the longest run without an involuntary stop should be allowed unless it can be shown, as in the case of the Rolls-Royce, that it was made in combination with economy in motor-house repairs and adjustments, in fuel consumption, and in making "as good as new" after the trial. In the same way, no claim should be made on the record for "reliability" on the score of economy in motor-house repairs and adjustments unless there be published therewith figures to show that the economy was effected in combination with efficient running (as proved by economy in fuel consumption) and economy in making "as good as new" after the trial.

I believe this matter is to receive further consideration from the Committee of the Royal Automobile Club, and for the present I think the superiority of the Rolls-Royce has been made so abundantly clear as to render attempts to prove otherwise ridiculous.—Yours truly,

CLAUDE JOHNSON.

WHICH IGNITION SYSTEM?

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—It would be more than an easy matter to say when this interesting question of "Which ignition?" was first started in discussion, so we must let it suffice and console ourselves with the reflection that the subject was much debated some twenty years ago in connection with oil engines. Since the introduction of the petrol motor it has cropped

Some Trials of a Motor Vehicle intended for use both on land and water have lately been made near New York. The illustration reproduced above shows the machine, which has been designed by M. J. Revellier, of Paris, about to enter the River Hudson.

during its 15,000 miles trial was less than the time and money spent similarly in the case of the six-cylinder Rolls-Royce. This claim might have had justification had not the record of the Hotchkiss car shown that the economy of time and money amounted almost to neglect to so adjust or repair the car as to make it run efficiently. The best test of efficiency is fuel consumption. The record of the two cars when translated into terms of "relative cost to the owner" are:—

IN 15,000 MILES.

	Hotchkiss.			Rolls-Royce.		
	hrs.	min.	£ s. d.	hrs.	min.	£ s. d.
Time spent in adjustment and repairs during the trial (reckoned at 2s. 2d. per hour) ...	9	44	= 1 1 0	40	13	= 4 7 2
Cost of fuel at 15.7 pence per gallon ...			127 5 2			62 10 2
			128 6 2			66 17 4
Number of involuntary stops...	3	1

up periodically, and can claim the doubtful honour of having been responsible for the flow of an abundant amount of ink. The reason for these spasmodic outbursts is not far to seek, for, despite the fact that during the last five years we have made enormous strides in the evolution of a simple and reliable method of firing the explosive charge in an internal combustion engine, we are all ready to admit that we have not as yet got a perfect ignition system. Moreover, it would be quite safe to remark that at the present time no one could with anything like a feeling of assurance predict when the question will be settled. And this for a very simple reason, as, for all we know to the contrary, even if the recent controversy of magneto v. battery was definitely decided, and the manufacturers concentrated all their attention on perfecting the faults of the favoured system, which is more than likely would be magneto, it is quite possible that it would not end there, because we already have other systems, and more will undoubtedly make their appearance in time. Whether they will prove themselves potentialities to be contended with remains to be seen, and will be disclosed by the result of putting that old adage "the survival of the fittest" into force.

The various systems in use may not be perfect, but, if of sound design and construction, embodying only the finest materials and best workmanship, they can be very reliable, provided they receive the necessary care and attention. In fact, it is surprising what a lot of

neglect some systems put up with before they begin to give any trouble, and then the owner is astonished at the cost of putting matters right. The subject is too deep and involves too much to go into here, but it would be as well to mention that the professional driver is often to blame in this respect, especially the type of man hailing from the average motor school. Not knowing over much about any part of the car, he has an abject horror of touching the magneto, in case it should go wrong; and so the result is the "sparking machine" gets left to take care of itself, but as it is not self-lubricating, in the majority of cases, the inevitable happens sooner or later.

The most common system—this being a fact in itself which gives it a decided advantage over other types, as efficient chauffeurs who are well acquainted with all the working details are more competent to make the necessary adjustments with accuracy, and by their experience they are also enabled to easily locate troubles when they arise and likewise speedily effect a remedy—is that known as ordinary high-tension ignition. Among the other advantages it can lay claim to are its comparatively small initial cost, and the easy starting it provides for, which also holds another number in the shape of the possibility of starting "off the switch." The troubles of this accumulator or battery ignition, taking all things into consideration, are by no means numerous and nowhere approaching what some magneto enthusiasts would have us believe. The coil, of which there are two types, "non-trembler and trembler," the latter being by far the most common, is sometimes a source of trouble, the prospect of which, for a budding motorist, can only be lessened by seeing that the article is of the best construction and bears a name of repute.

The contact maker is also liable to remind one of its presence at times, although, if of a good make, that is not at all likely until it has

Photo by] Mrs. Charles Jarrott and her Mors Limousine. [Campbell Gray.

been in use for a considerable period. At regular intervals it should be thoroughly washed with petrol, cleaned, and re-lubricated with pure vaseline. Of course, no self-respecting motorist would go very far without a spare sparking plug in his possession. I might name the chief little worries incidental to this system as, accumulators running down, faulty platinum points, trembler adjustments occasionally necessary, and the delightfully mystifying short circuits which now happily are a rare occurrence on a well electrically fitted car. Not so many years ago, when electric ignition was not so well known as it is now, and when the tube system was sometimes fitted in case the electric should fail, and experience was much dearer than it is at present, it was not an unfrequent sight to come across a car in some outlandish place with the driver vainly in search of a "short." Again, there is the cost of keeping the accumulators charged to be added to the disadvantages of this type. But on the whole, with the excellent fitting now obtainable, there is no doubt that with a good accumulator and coil system, which is well looked after and receives all the attention it should, from the hands of a competent person in charge, an extra and fully charged accumulator and a few necessary spares being carried, one can feel almost as free from the anxiety of being stranded in some out-of-the-way place through a breakdown in the ignition system, as though provided with a duplicate, the purpose for which it so often serves.

Another type, termed synchronised ignition, calls for mention, by reason of its adoption by some makers. It can be made very efficient and reliable; but in spite of the fact that the single coil gives the same quality of spark to each plug, this being a great advantage, it is a weak

point, owing to the multiple work thrust upon the one coil. However, the risk of its failure at any time proving a serious matter can be eliminated by carrying a spare.

Now I come to magneto ignition. Here we have both the "high" and "low" tension types to take into consideration. Dealing with the system as a whole, if we have magneto ignition there is no charging to bother about, the running expenses being second only to nil, and the renewal and repair charges are few and far between, although the latter when they do occur are, as a rule, rather expensive. The fact that magneto ignition is not very well understood by the average repairman, the high initial cost of a really good system, and the remembrance that we cannot generally start with a half turn of the starting handle, must be numbered among the disadvantages. Individually, the high-tension type scores by being adaptable to any existing engine without constructional alteration, and the low-tension, principally, by proved reliability.—Yours truly,

J. MORSE SCOTT.

[We shall be glad to have the views of readers on the points raised by our correspondent.—ED. M.C.J.]

THE CAUSE OF BACK FIRING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I drive a two-cylinder car of excellent qualities, but which is guilty of one peculiar habit—that of back firing. It only does this when the accelerator is released or opened when slowing down in traffic, and also when the car overruns the engine with the clutch in downhill. The valves are good and tight; coil, contact breaker, wiring and accumulators in perfect order. The carburettor is a Longuemare, and no matter which jet or choke tube is used, or which other make of carburettor, automatic or not, it does not stop the back firing, and, curiously enough, the engine and car work perfectly in every other way. I have also tried valves timed differently, but to no use. If you or any reader of the *M.C.J.* can offer a solution I shall be obliged.—Yours truly,

R. THOMPSON.

[The immediate cause of back fires in the exhaust box is, of course, due to unexploded charges passing to it from the cylinders, which are subsequently ignited by the heat from charges that have fired in the proper place. A very common cause of this happening is traceable to sudden alteration of the speed of the engine, whereby the mixture in the carburettor is rendered temporarily imperfect. It can also be due to the timing of the spark being late in proportion to the revolutions, as may be caused by neglecting to advance the ignition after slowing down and then opening the throttle. It is also likely to happen when the car is allowed to over-run the engine with the clutch in, which, by the way, is very bad practice. It must be borne in mind that the exhaust valve is timed to open quite 1-5 before the end of the firing stroke and that, therefore, with the engine running fast and the contact maker retarded a great deal, some unignited charge can get out and be fired by the residue of the scavenging stroke.]

AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could inform me why my 4½-h.p. Benz car does not run so well as it did a few weeks ago. Everything seems to be in the same condition except the inlet valve. Part of the explosion seems to come out of the inlet and carburettor. How long it has been like this I cannot say, but I think this is the cause of the trouble. I examined the valve and found that it would hold petrol all right, but the spindle was a bit loose in the sleeve, so I fitted a new valve and sleeve. I have tried different strengths of springs and amounts of lift to the valve; the valve face is 52 deg. and about 1 1-16 in. wide. The vapour pipe is clear and I have cleaned the gauges separately with a brush. I have tried the exhaust valve with both late and early opening; I have thoroughly scraped and cleaned the compression space end of piston and valve chamber; the water circulation is good and never boils; there is a good blow out of the air inlet and carburettor. The engine uses a lot of petrol; I have to give it about all gas. I think the blow from the explosion fills the vapour pipe and the engine gets a poor mixture.—Yours truly,

F. V. A.

[As the explosions seem to come out of the inlet and carburettor, it would appear that the new induction valve fitted by "F. V. A." does not close properly when working. To trace the exact fault would require actual examination, but perhaps the most likely thing is that the seatings are not good; either not true with one another, or else a slight ridge may be there. Also the stem of the valve may hang a little in the sleeve and so prevent it moving quickly enough. Does "F. V. A." know that these 4½-h.p. Benz engines have nearly always an extra air valve placed horizontally at the back of the cylinder? Has he one to his, and if so, has he ascertained that this is properly regulated and in good working order? A weak mixture will cause explosions (feeble ones) in the inlet pipe and carburettor; but, since our querist complains that his Benz uses a lot of petrol, it would not appear to be the cause in the present instance.]

REPLYING to the inquiry for the maker of the Caesar non-skid, the Ace Rubber Company, Ltd., 58, High Street, Bloomsbury, W.C., inform us that they have a stock of the same.

The Olympia Show.

(Continued from page 850.)

The Swift Cars.

The SWIFT MOTOR COMPANY, LTD., made a thoroughly interesting and attractive exhibit of the well-designed cars which they have produced for the coming season. Whilst these new types possess no outstanding feature in the way of novelty, they are designed on thoroughly practical and proved lines, and it is not difficult to foresee that the Swift is destined to become one of the popular cars of the coming season. This firm's popular two-cylinder 10-12-h.p. model, generally associated with a two-seated body, has this year been constructed to carry a side-entry body, of which a finished example was shown on the stand, the wheel-base being extended to 7 ft. 9 in., and the chassis strengthened throughout. The details comprised in its construction remain practically as before, but with the above-mentioned reservation as to their being strengthened. The two new chassis, of 18-24-h.p. (Fig. 102) and 25-30-h.p. respectively, perhaps rather overshadow their remodelled elder sister in point of interest, and, being altogether new models much above the horse-power previously attempted, have excited considerable attention to their sound construction and freedom from experimental fads. The bores and strokes of these two new four-cylinder models are 102 mm. by 111 mm. and 111 mm. by 130 mm. respectively, but whilst the 18-24-h.p. has its cylinders cast separately, in the 25-30-h.p. they are cast in pairs, and in other details, too, the more powerful model differs from the first mentioned. In the 18-24-h.p. the valves are carried on one side of the motor, being actuated, of course, from the one cam shaft, the whole of the distribution gear being enclosed and the valve tappets provided with fibre cushions. Standard models are furnished with accumulator and coil ignition only, but provision is made on the right side of the engine for so extending

being just above the base chamber at an angle of 45 degrees, and driven by bevel gear from the cam shaft end. A multiple-disc clutch is fitted, power being conveyed through a cardan shaft to the gear-box, which provides four forward speeds and a reverse motion, a direct drive being given on top speed. From thence the transmission is by the propeller shaft to the rear live axle, all of similar design to the model just described. Whilst the brake on the main shaft is of the contracting type, those on the road wheels are of the internal expanding variety. Ball bearings are fitted throughout the gear-box, similar bearings being employed on the front axle, of H section. The exhibit was completed by an example of the 10-12-h.p. lengthened chassis model, a 10-12-h.p. two-seated car, and a very handsome limousine, finished in dark greens, fitted to a chassis of the 25-30-h.p. type.

The Renault Cars.

The display of Messrs. RENAULT FRERES, LTD., comprised a 9-h.p. two-cylinder landaulet, the chassis of which is similar to those employed in the popular taxi-cabs in London, a 10-14-h.p., a 20-30-h.p., and a 35-45-h.p., the latter being equipped with a luxurious limousine body by Cockshoot, of Manchester. The 1908 models do not vary from those of the past season, except in small details, the familiar dashboard radiator and sloping bonnet being still retained. The engine of the 35-45-h.p. car is fitted with a self-starting device of the compressed air type, while the 10-14-h.p. vehicle has the pedal-operated engine starting device described in our report of the Paris Salon. The arrangement is one of the simplest and most practical means of starting the engine from the driver's seat that we have seen.

Fig. 102.—Chassis of Swift 18-24-h.p. Car.

the gear-driven water-pump spindle that the fitting of a high-tension magneto is quite a simple matter. The gear-box to this type is similar in design to that of the 10-12-h.p., but in this case "gate" control is provided. It will be remembered that the gear-box is a single casting, and therefore quite oiltight. The transmission is through a double-jointed cardan shaft to the rear axle, which has been entirely remodelled, the weight now being taken by the sleeve. A peculiar form of double-tube torque rod is fitted, it being suspended from the tubular central cross member of the chassis on a swinging link, and is supported above and below by helical springs. From this cross member is also hung the rear end of the subsidiary frame, of rectangular section, which carries the gear-box and motor. Contracting brakes are fitted both on the main shaft behind the gear-box and also to the drums carried on the rear road wheels. The cardan joints are all enclosed in dust-proof cases, and the shaft itself is carried on very long bearings. The front axle is of tubular section, the steering link being carried in front thereof. Lubrication is by pressure to dash, and thence by gravity. The clutch is of the ordinary leather-faced cone type, being provided with flat buffer springs under the leather. A novel feature, giving freedom of access to valve tappets, is that the exhaust from each cylinder is led separately below the chassis, and thence to a common dashpot, from which they pass to the exhaust-box. As previously stated, the 25-30-h.p. is fitted with a motor whose cylinders are cast in pairs, but, as in the previous case, the valves are carried on one side of the engine and worked from one cam shaft. Dual high-tension ignition is fitted, the magneto plugs being placed angularly on that side of the engine opposite to the valves; the plugs fed from the accumulator are placed over the inlet valves, the contact-breaker

The Brown Cars.

Messrs. BROWN BROS., LTD., had a comprehensive display of their various vehicles on a stand of somewhat contracted area under the gallery. The exhibits comprised an example of the firm's 25-30-h.p. fitted with a D-fronted limousine landaulet painted in dark blue, a 40-h.p. with a touring body finished in rich automobile crimson and provided with a double extension hood and windscreen, and a 20-22-h.p. with a touring body finished in French grey, upholstered in fawn leather, and fitted with double extension hood and windscreen. The 25-30-h.p. and the 40-h.p. models are identical in all main features, except that the motor of the higher-powered type has six cylinders, while its less powerful sister has only four cylinders, the bore and stroke in each instance being 100 mm. by 130 mm. The cylinders are cast separately, and are connected up to the base chamber in pairs, the valves being distributed on either side of the engine. The whole of the distribution gear is encased, the two cam shafts being carried in separate casings. An extension of the inspiration cam shaft carries the magneto-driving spindle, whilst the lubricating pump, the water-circulating pump, and the cooling fan are driven by a common spindle from the exhaust cam shaft. As in all the Brown cars, transmission is by cardan shaft to a live rear axle. In the six-cylinder model (Figs. 103 and 104) the carburettor has two jets and separate mixing chambers, whilst in the four-cylinder type only one jet, &c., is employed. Two independent high-tension ignitions are fitted, the magneto having a fixed point of firing, and the advance of the accumulator and coil ignition being attained through the intermediary of a lever and sector on the steering wheel. Four speeds, with direct drive on top, are provided, the control being through a "gate" type sector, whilst Hoffmann ball

bearings are fitted to all rotative parts except the motor. The 20-22-h.p. type differs from either of the preceding in that it has a motor of 100 mm. bore with a stroke of 100 mm., and the cylinders cast in pairs. In this case, too, the valves are all assembled on one side of the motor, a variable lift for the inlet valves being provided. The whole of the distribution gear is enclosed, as well as the pinion controlling the movement of the magneto, the water pump, and the oil pump feeding oil to the sight feeds on the dash. The gear gives three forward speeds, with direct drive on top, and the transmission is by

Figs. 103 and 104.—Elevation and Plan of the Brown 40-h.p. Six-Cylinder Car.

cardan shaft to the strongly-constructed rear axle. Two independent high-tension ignitions are fitted, and Hoffmann ball bearings are provided to all rotative parts. A contracting brake is carried on the main shaft of the gear, and a ratchet sprag is also fitted thereto, whilst the rear road wheels carry drums having internally expanding brakes.

The Maudslay Cars.

The display of the MAUDSLAY MOTOR COMPANY, LTD., was of a very high-grade order both as regards the chassis and the carriage work of the vehicles exhibited. Interest largely centred on the company's latest production—a 25-30-h.p. live axle car. The engine

Fig. 105.—Elevation and Plan of the Maudslay 25-30-h.p. Live Axle Car. The part marked A is forged in one piece with the axle sleeves, B and C being detachable casings.

(Fig. 106), which is of the special design associated with the Maudslay Co., comprises four cylinders cast in pairs, with the valves all located directly in the cylinder heads, they being operated off an overhead cam shaft, which in its turn is actuated by a vertical spindle driven through gearing at the forward end of the crank shaft. The cam shaft is pivoted so that by loosening the retaining bolts it can be swung clear of the valves, allowing any of the latter, together with their springs and seatings, to be instantly removed. The engine dimensions are $4\frac{1}{2}$ in. bore by 5 in. stroke. The base chamber is provided with

detachable doors of such a size that not only can the crank shaft and big end bearings be readily inspected, but, if occasion arises, a complete piston and connecting rod can be withdrawn without it being necessary to dismantle the engine. Two systems of high-tension ignition are provided, the magneto being mounted on the dashboard, and driven by gearing off the end of the cam shaft. The lubrication is maintained by a gear-driven pump, which draws the oil from a sump in the base chamber. The clutch is of the leather-faced cone type, a feature being that to facilitate easy dismantling the cone portion is built up in two halves. The change-speed gear is "gate"-controlled, and gives four speeds forward, with a direct drive on the third. With a view of furnishing a long cardan shaft so that the acuteness of the angle between the rear of the gear-box and the differential casing shall be reduced to a minimum, the gear-box itself is located close up to the clutch. The cardan shaft has a ball bearing universal joint at the forward end and a combination sliding and universal joint at the rear. The rear axle construction is of an interesting new design. The axle sleeves and differential casing are all in one piece, and made from a single forging. The latter is first slit in the middle, and is then drifted out to form a loop or bridle which can accommodate the driving differential mechanism. The extremities are afterwards machined to circular form and bored through to accommodate the live shafts. The front and rear sides of the loop in which the differential is supported are closed by two light aluminium dished covers. By detaching the rear one and by removing the hub caps and slightly withdrawing the live shafts, the bevel pinions and the differential gear can be lifted out, enabling these parts to be readily inspected or the gear ratio changed without difficulty. The weight of the car is carried

Fig. 106.—The Maudslay 35-45-h.p. Motor. The illustration shows the overhead cam shaft, the method of driving the magneto, and also the large inspection doors to the base chamber.

by the casing, the axle itself transmitting the drive to the wheels through jaw clutches in the hubs. Both the foot and hand operated brakes are all concentrated on the drums on the rear road wheels. The drums are wider than usual, and have two sets of expanding bands in each, one actuated by pedal and one by a hand lever. The frame is of drawn steel tubing of rectangular section filled with ash. The 35-45-h.p. four-cylinder chain-driven chassis is on the same lines so far as the engine is concerned, the bore and stroke being in this case 5 in. by 5 in. The model, generally speaking, shows, except in a few detail improvements, but little change from last year. The complete cars on view included a 35-45-h.p. limousine with very handsome body by Messrs. W. and F. Thorn, a 35-45-h.p. with extended landaulet by Messrs. McNaught and Co., and a 35-45-h.p. open phaeton designed for touring purposes.

The White Cars.

In important competitions in this country the White steam car has won a place among Society cars, its ease of running, absence of noise, and carriage-like appearance having given it favour in fashionable circles. As regards construction, the main principles of the White system have been familiarised to the British public by Mr. F. A. Coleman, and the changes in the 1908 vehicles do not affect the main lines of the chassis. They are points of improvement suggested by experience as tending nearer that perfection of the automobile which is, perhaps, not so far off as some would think. The essential feature of the success of the White car has been the generator constructed of helical coils of seamless tubing placed one above the other. These are surrounded by a casing of insulating material, the heat being applied

at the bottom by means of a burner. The fuel supply is governed by a simple automatic device operated by the flow of water to the generator. Owing to the peculiar connection of the tubing, the water is not regulated by gravity, but is subject to the action of the pump, and thus the White steam generator has none of the conditions of the ordinary steam boiler—an assurance that should satisfy those who have hitherto given little attention to the merits of the steam car for touring or town work. With regard to both the 20-h.p. and 30-h.p. cars for 1908, an important alteration is in connection with the thermostat, the valve stem of which in the new type is now made accessible and readily adjustable. A temperature gauge is also introduced, enabling the exact heat of the steam to be ascertained at any time. Other changes common

Fig. 107.—The "White" Steam Limousine.

to both chassis are in the dropping of the engine and generator lower to the ground than was formerly the case, without, however, lessening the road clearance. Thus the propeller shaft is brought more nearly horizontal, resulting in a lessened strain on the universal joints and adding to the efficiency of the drive. This innovation enables the burner, vaporiser, and pilot light to be brought below the side frame of the chassis, obviating the risk of scorching any part, and also adding to the accessibility of the burner. The piston valve in the high-pressure cylinder has been improved as the result of last year's experiments, and what is practically a new compression pump has been fitted, and two gauges on one dial are now worked by red and black hands, a simplification of parts that is indicative of the anxiety of the White

The Mors Cars.

The display of MORS (ENGLAND), LTD., comprised four models—a 50-60-h.p. six-cylinder chain-driven chassis, a 45-h.p. four-cylinder limousine, a 20-30-h.p. live axle chassis, and a 15-20-h.p. landaulet. The latter, which has already been described in the *M.C.J.*, has been especially designed as a town carriage, and has already proved a favourite type in this country. The engine has four cylinders in one casting, 90 mm. bore by 100 mm. stroke. All the valves are on one side of the engine, and operated off a single cam shaft, which is also adapted to drive the oil and water pumps, the former through worm and the latter by bevel

Fig. 108.—The Mors 15-h.p. Landaulet.

gearing. The new 20-30-h.p. car is made with either chain transmission or a live axle. In this vehicle the cylinders are cast in pairs, with the valves operated by separate cam shafts. The water circulation is maintained by a pump driven by bevel gear off the half-time shaft. The lubrication is effected mechanically by pump driven from an eccentric on the end of the cam shaft. A Mors high-tension magneto generates the current for the ignition, the apparatus being placed on the valve side of the engine. The carburettor is placed on the opposite side, the inlet pipe passing between the two centre cylinders. Two jets are fitted to the carburettor, one being for ordinary work under a full load and the other acting as a kind of by-pass when the engine is running light. Immediately the throttle valve is opened, either by

Fig. 109.—Chassis of Mors Six-Cylinder Car.

Company to secure every possible improvement. With regard to the 20-h.p. car, the size of the tubing in the generators has been increased to that of last year's 30-h.p. vehicles—viz., an inside diameter of $\frac{3}{4}$ in., so that a greater reserve of power will be obtained, although the weight of the car will not be increased. The vehicles on the stand included a luxurious 20-h.p. limousine for Miss Marie Tempest, the delicate upholstery of the interior of which is as striking as the fine finish and outline of the exterior. Models of both the standard sizes were shown fitted with limousine and double phaeton touring bodies. The carriage work is all of London origin, and affords a good comparison with the best examples from across the Channel.

means of the lever on the steering wheel or by the accelerator pedal, the large jet is brought into action. The throttle is automatically closed again by the clutch pedal when it is depressed. The clutch is of the metal-to-metal contracting type working on a drum formed in the flywheel. It works on the same principle as a metal-to-metal band brake, and is brought into operation by a steel cone being pushed forward, under the action of a spring, between two levers. As the cone moves forward it forces apart the levers, and causes the band to contract and grip the steel drum in the flywheel. A "gate"-controlled change-speed gear is used, giving four speeds forward and a reverse. Other parts of the chassis worthy of notice are the strong back axle

in the live axle model and the forked radius rods. The springs, three-quarter elliptic in rear and half elliptical in front, are of ample proportions. Fig. 109 depicts the chassis of the 50-60-h.p. six-cylinder car. As will be seen, the cylinders are cast in pairs, with the valves on opposite sides, the bore being 110 mm. and the stroke 150 mm. A feature of the design is that, to reduce the length of the bonnet, the rear pair of cylinders are placed under the duplex dashboard. Two systems of ignition are provided—low-tension magneto and high-tension by coil and accumulators. The clutch is as in the other cars, while the gear-box gives a direct drive on the top, fourth speed to the dif-

Fig. 110.—The Rover 20-h.p. Four-Cylinder Engine.

ferential shaft through its own bevel pinions, the other speeds being transmitted through a separate set of bevels. The final drive is by side chains. A substantial braking system is installed, the hand-controlled brake on the rear wheels being supplemented by double foot-actuated brakes on the countershaft. On all the cars ball bearings are fitted throughout, except to the engine. The suspension of the chassis is effected by extra long semi-elliptic springs in front and three-quarter elliptics at the rear. We may add that detachable rims are now fitted to the wheels of the Mors cars from 17-h.p. upwards, which enables a tyre to be changed in a few seconds with the greatest ease. Altogether, the Mors cars, which were amongst the first put on the market, are being kept fully abreast of the times.

The Rover Cars.

The exhibit of the ROVER COMPANY, LTD., was an interesting one from two points of view—in the first place because of the 20-h.p. cars

Fig. 111.—Chassis of the Rover 20-h.p. Car.

built on similar lines to the vehicle which won the 1907 Tourist Trophy race, and, secondly, on account of the attention the concern are devoting to the construction of reliable small cars at a popular price. The 20-h.p. car is an especially interesting model. The greatest departure from ordinary practice is the three-point suspension of the body and engine, secured by hanging the forward end of the engine to the centre of a single front spring lying directly over the front axle. The engine, clutch, and gear-box casings are coupled together so as to form one rigid piece, which reaches almost to the forward ends of the long semi-elliptic rear springs. By this means the necessity for the

usual heavy steel frame is obviated, a much lighter one sufficing for the work of supporting the body. The motor (Fig. 110) has four cylinders separately cast, with the valves all located on one side; the bore is 97 mm. and the stroke 110 mm. The crank shaft is supported on ball bearings, while the induction pipes are so arranged that every cylinder gets an equal charge, and both the inlet and exhaust pipes are taken clear away from the valve stems, allowing any valve to be removed without difficulty. The carburettor is of the Rover Company's special pattern; by its use the quality of the explosive mixture of gas and air is automatically regulated to suit the speed at which the engine is running. The standard ignition is by coil and accumulators, but provision is made for fitting a high-tension magneto. The contact-maker, which is of an interesting design, is now in front of the engine, and most accessible. The petrol tank is now made as part of the dashboard, instead of being under the seat, as formerly. Another feature of the design is the use of the engine as a brake. The cam shaft is of special design, and, in addition to lifting the inlet and exhaust valves in the usual way, is so constructed that it can be used to effect an engine or compression brake. Beside the ordinary cam shaft is placed a pedal-actuated control shaft, extending from which to each set of cams—inlet and exhaust—is a fork by means of which the cam shaft can be moved backwards. On depressing the pedal, the auxiliary shaft is drawn to the rear, the forks draw the cam shaft in a longitudinal direction. This sets up an entirely different operation, for the inlet cam being drawn out of position, the large ball which lies at the bottom of the tappet revolves on a circular portion of the cam stem, and the inlet valves become completely closed for the whole cycle of operations. The exhaust cam is also drawn out of its normal position, but instead of the extreme left-hand portion being circular, as in the case of the inlet cam, it possesses two projections, which lift

Fig. 112.—The Rover 8-h.p. Coupe.

the exhaust valve twice to every revolution of the shaft, with the result that air is taken in from the exhaust pipe on every downward movement of the piston, compressing on the upward stroke, and then exhausted. The inlet valve being permanently closed, no gas is admitted to the combustion chamber, with the result that the engine is working under compression, which effectually retards its movement, and at the same time it is being cooled. The arrangement has proved so effective in practice that it is claimed to be sufficient to hold the car when the low speed is engaged on almost any hill. The clutch is of the metal-plate type introduced by the Rover Company, and the "gate"-controlled change-speed gear can be adapted to give three or four speeds forward, as desired, in addition to the reverse. In the four-speed model the direct drive is on the third, and not on the top. The final transmission is by a cardan shaft and bevel to the live axle. In addition to the engine brake above mentioned, a pedal-operated brake is fitted to the gear shaft, while there are also the usual rear wheel emergency brakes. The sides of the car between the foot-board and the frame, as far back as the rear springs, are entirely closed in. The wheel base of the chassis is of a length to allow a roomy side-entrance body of either the closed or open type to be fitted, the cars on view including a handsomely appointed landaulet. The well-known Rover 8-h.p. cars were shown as two and four seaters, and also a doctor's coupé. This vehicle (Fig. 112) has two inside seats and an outside one for the driver, the place of the usual second front seat being taken up by a very accessible door. An innovation on all the 8-h.p. cars is a neat type of side lever for changing gear, and wheel control of the engine. A new contact maker of a most interesting design is also fitted in connection with the engine, a positive earth connection being at all times maintained. The Rover 6-h.p. single-cylinder vehicle has many improvements, the following being a few of the most noticeable:—Two millimetres have been added to the

bore of the cylinder, the 1908 model being 97 mm. by 110 mm., thus giving both greater power and greater cooling efficiency; the front and back axles have been re-designed and strengthened; the body is a neat tulip shape, upholstered in leather, and the bonnet and dash have been improved in shape and style; the bonnet fastener is a neat spring clip type, and platform steps have been added, the latter considerably improving the appearance of the vehicle.

The Berliet Cars.

Ranking high in the automobile engineering world as they do, the Berliet cars displayed by Messrs. J. E. HUTTON, LTD., naturally attracted considerable attention. Prominent on the stand was a 60-h.p. six-cylinder chassis. The cylinders are cast in pairs, with the valves on opposite sides; the bore is 120 mm. and the stroke 140 mm. The ignition is by high-tension magneto, and the carburettor of special automatic design. The clutch is of the multiple-disc type, and the four-speed gear-box is "gate"-controlled, and is arranged to give a direct drive both on the third and fourth speeds, this being obtained by means of two bevels on the end of the gear shaft meshing with two crown wheels arranged one within the other on the differential shaft. Both the bevel pinions are free to run on the propeller shaft, one or other being engaged as required by means of a dog clutch. The gear-box and differential case are one casting, but are divided internally into two compartments. The final transmission is by side chains to the rear road wheels. In addition to the usual hand-operated brakes in drums on the rear road wheels, two pedal-actuated brakes are mounted on the differential shaft. The 22-h.p. four-cylinder car is interesting as being a duplicate of the one which holds a record for petrol con-

Fig. 113.—The Berliet 22-h.p. Victoria with curved frame.

sumption—viz., 62½ miles on two gallons of petrol, carrying four passengers at an average speed of forty-six miles an hour. The frame is of a specially-curved design, to allow of the fitting of low side-entrance bodies for town use to the chassis, with the attractive result depicted in Fig. 113. The cylinder dimensions are 110 mm. bore by 120 mm. stroke, and in this model the ignition is by low-tension magneto. The power transmission is either by side chains or cardan shaft to the rear live axle (see Fig. 114), the latter being of an interesting design. The casing is built up of two forged steel sleeves solidly attached to the differential case. The live shafts, which have only the driving effort to withstand, transmit the power to the wheels through the hubs by means of the coned ends and two keyways. The rear suspension is by full elliptical springs. Throughout the whole of the Berliet cars the workmanship is of the highest class, ball bearings being employed to all parts, except the motor. A 40-h.p. car equipped with a luxurious limousine-landaulet body was also displayed. The fittings of this body are unique, and include a neat folding wash-basin with supply of water, a complete canteen for tea, and another one for lunch, these being all neatly packed away in portions of the body specially designed for their reception. There is also a special fitting to take a Thermos bottle, electric communication with driver, electric light, &c. A most instructive exhibit at this stand, showing, as it does, the complete working of the motor, was a four-cylinder Berliet engine, every part of which was cut in section to enable the internal working to be seen. Unfortunately, Messrs. Hutton were not able to show what would have probably proved the *clou* of the Exhibition, a 40-h.p. six-cylinder Berliet, arranged to run on either petrol or compressed air, or both, at will. Some particulars of the new model were given in our report of the Paris *Salon* last week, and we await a drawing of the arrangement with interest.

The Spyker and Zedel Cars.

The BRITISH AUTOMOBILE COMMERCIAL SYNDICATE, LTD., had on view a range of the well-known Spyker cars, including a 15-20-h.p. chassis with an improved form of "gate" control to the change-speed gear, a 20-30-h.p. landaulet, and a 20-30-h.p. side-entrance double phaeton with Cape cart hood. The Spyker Company, of Amsterdam, has now turned its attention to the construction of motor-cabs. While the main points of the Spyker vehicle are retained, the new 10-15-h.p. model (Fig. 115), which is also intended for the use of doctors and

Fig. 114.—View of the Rear of Chassis of the new Berliet Live Axle Car.

other professional men, comprises several new features. The frame is made of steel, stamped cold. It is very wide and strong, and is narrowed at the front to enable the chassis to turn in the required distance of 25 ft. The motor comprises four cylinders in one casting; the bore is 80 mm. and the stroke 90 mm., and at 1,000 revolutions per minute 16-h.p. is developed. In order that overheating troubles shall be obviated a very large honeycomb radiator is employed. The ignition is by Simms-Bosch high-tension magneto, and, as the point of firing is fixed, only one lever is provided on the steering wheel. This actuates the throttle and is also connected up to a pedal so that the driver may regulate the speed of the engine either by hand or foot. The lubrication of the motor is so arranged that it is impossible for over-lubrication to take place, the emission of obnoxious smoke being consequently prevented. The "gate"-controlled change-speed gear gives three speeds forward and a reverse; the final transmission is by a cardan shaft and bevel gear to a live axle, which latter has

Fig. 115.—Chassis of Spyker 10-15-h.p. Landaulet Cab.

only the driving strain to withstand, the weight of the car being carried by the axle casing. Special attention has been paid to the brakes, while ball bearings are used throughout, they being even fitted to the engine crank shaft. The chassis is fitted with a comfortable body of the landaulet type, having accommodation for four persons inside. The Zedel is a French-built car, the agency for which has been taken up by the B.A.C.S.—the exhibit comprising a chassis and a coupé arranged to be driven from the inside. We gave a description of this interesting vehicle in our report of the 1906 Paris *Salon*, pointing out that it was

a reproduction in miniature of modern powerful four-cylinder cars. The engine, which is rated at 10-12-h.p., has the four cylinders all in one casting, with the valves arranged on opposite sides. The ignition is by high-tension magneto, and pump lubrication is adopted. The clutch is of the multiple-disc type, and the drive is through a "gate"-controlled three-speed gear-box and cardan shaft to a live axle.

The Miesse Cars.

The MIESSE PETROL CAR SYNDICATE, LTD., contented themselves with displaying an example of their 24-h.p. four-cylinder chassis and another

Fig. 116.—The Miesse Six-Cylinder Engine with the Cylinders all in one casting.

of their 35-h.p. six-cylinder type. The 24-h.p. remains practically the same as during the past season, excepting that some detail improvements have been effected, materially increasing efficiency and ease of adjustment, &c. Among these modifications, mention may be made of the provision of dog clutches to the shafts driving the magneto and the pump, the application of ball bearings to these shafts, and the entire enclosing of the distribution gear. Other improvements comprise the

Fig. 117.—Two Views of the Combined Engine, Clutch and Gear-box on the Buick 24-h.p. Car.

main shaft brake with two segments in lieu of the previous continuous band, and the jointing of the two cardan joints longitudinally, thereby permitting of the employment of four bolts in place of eight previously necessary. In the case of the rear cardan the coupling is provided with a special web, which forms an oil retainer. In the six-cylinder model (Fig. 116) the practice pertaining to the four-cylinder type has been followed in all main features, but, unlike its earlier prototype, the cylinders are all cast in one block, and was the only example of a six-cylindered

motor so cast at the show. High-tension magneto ignition is fitted, and the valves are distributed on opposite sides of the cylinders as in the earlier model. The admission chamber is provided with a diaphragm running nearly its whole length, but with spaces at each end permitting the flow of the gases; by this means the gases flowing to the middle pair of cylinders are made to travel the same distance as those passing to the two outer pairs, thus equalising the suction to all cylinders. The carburettor previously employed has been retained, the cardan shaft is as now fitted to the 24-h.p., and in all other essential features there is a continuation of the practice which has proved so satisfactory on the smaller model.

The Buick Cars.

Messrs. STERNBERG AND EASON exhibited two models of the Buick, two examples being given of each type, the two-cylinder car of 22-h.p. shown with a landaulet body and also as an ordinary four-seated side-entry phaeton, whilst the models having four vertical cylinders of 24-h.p. were furnished with a "runabout" body and a four-seated side-entry phaeton respectively. The 22-h.p. type is provided with a horizontal motor having two double opposed cylinders with a bore of $4\frac{1}{2}$ in. and a stroke of 5 in. The valves are carried in a cage capable of being easily removed, together with the valves. The gear is of the epicyclic type, the control of the high speed being by side hand lever, whilst the reverse and low gear are manipulated through foot pedals. The gear can be easily dismantled from the frame without interfering with the motor or other mechanism. Water circulation is maintained by a direct gear-driven pump. The brakes are of the internal expanding type. In the four-cylindered car the cylinders, as previously stated, are vertical, having a bore of $4\frac{1}{2}$ in. and a stroke of 4 in., rated as 24-h.p. The valves are disposed on opposite sides of the cylinders, whilst transmission is through a multiple-disc clutch running in oil to the gear-box, giving three speeds and reverse by

Fig. 118.—The Adler 28-h.p., with Morgan Limousine Body.

sliding pinions, and thence by cardan shaft to the live axle. The striking feature of this type is that the engine, clutch, and change-speed gear are assembled as one unit (Fig. 117). Separate chambers are provided for the crank, clutch, and gear, the main flywheel is carried in front of the engine, the whole being fixed by a five-point suspension, three points being flexible. Water circulation is maintained by a gear-driven pump, and lubrication is also effected by similar means. A contracting brake is fitted at the tail end of the gear-box, whilst the road wheels have drums fitted with internally-expanding brakes. The vehicle is a very interesting one, embodying points quite novel in British practice, and the exhibit, as a whole, was of an attractive nature.

The Adler Cars.

Messrs. MORGAN AND Co., LTD., of Long Acre, London, W.C., exhibited three sizes of the Adler vehicles, which are manufactured at Frankfort-am-Main by one of the largest motor concerns in Germany, and for whom Messrs. Morgan are the British agents. As the 18-h.p. and 28-h.p. four-cylinder cars are on practically the same lines, the following particulars may be taken as applying to both. A feature of the Adler construction is that the engine, clutch and gear-box are built up and fixed in the frame as a unit. The engine comprises four cylinders, cast in pairs. The valves are all operated off a single cam shaft, the gear wheels operating which are entirely enclosed. The cylinder dimensions are 90 mm. bore by 110 mm. stroke in the case of the 18-h.p., and 105 mm. by 120 mm. for the 28-h.p. Two systems of high-tension ignition are provided—magneto and coil—while the carburettor is of a special automatic type, the throttle being controlled both by a centrifugal governor and a lever on the steering wheel. A separate admission pipe is provided for each pair of cylinders. The lubrication of the engine is effected by pump operated off the governor spindle. The clutch is of the metal-to-metal disc type working in oil, while the gear-box is of the sliding pinion variety, adapted to give three speeds and reverse, with direct drive on top speed. The control is by single lever working in a "gate." A neat arrangement is pro-

vided, which prevents the reverse motion being engaged by mistake, a small cap to the top of the lever having to be lifted up to enable a knob within to be pressed down. The final transmission is by a cardan shaft and bevel gear to a live axle. The cardan shaft is enclosed over its full length, the sleeve acting as a torque rod. Two radius rods also extend from the forward end of the cardan sleeve to the frame. Both foot and hand brakes are provided; the former is water-cooled, a small pedal slightly in advance of the main one opening the water supply whenever the brake is applied. Ball bearings are fitted to all parts except the engine crank shaft. There are many other points of interest in the Adler cars, reference to which is prevented by the pressure on our space. It may be said, however, that throughout the details bear evidence of having been very carefully thought out, while the workmanship is of an equally high order. The 18-h.p. was shown in chassis form, while the 28-h.p. was fitted with a limousine body (Fig. 118) by Messrs. Morgan. This is constructed to carry seven passengers, and is equipped with the firm's "Cromwell" front screen. The cushions have copper springs in place of the ordinary wire type, and the upholstery is in drab cloth. A moderate-priced car which has many interesting points is the Adler 9-h.p., which can be fitted with either a two or four seated body. The motor comprises two cylinders arranged in V form, of 85 mm. bore and 90 mm. stroke. The inlet valves, which are of the ordinary suction type, can be quickly taken out by loosening a screw and taking off the cover, without it being necessary to remove the inlet pipe. A point worthy of notice is that both Simms-Bosch high-tension magneto and accumulator and coil ignition are provided. A transverse shaft in front of the motor, operated off the half-time shaft, actuates the contact maker as well as the magneto. The water circulation is maintained by a gear-driven pump, while an automatic carburettor furnishes the mixture. The clutch, which is of the metal-to-metal cone type, can be taken out without dismantling the engine or gear. Three speeds and a reverse are provided by a change-speed gear of the sliding pinion type. The top

Fig. 119.—The Itala Six-Cylinder Motor.

speed is direct, and when this is in operation the side shaft is entirely out of gear. The change-speed control is on novel lines; it is actuated by a lever that has a T-shaped handle. The driver has only to make direct forward or backward thrusts of the lever, the actual selection of the gear required being achieved by the turning of the specially-shaped handle. The final drive is by cardan shaft and bevel gear to a live axle. The road wheels are of a new design; they are built up entirely of pressed steel, the spokes being electrically welded to the rims. Tests with the steel wheel, which is no heavier than the artillery type, have shown it to be much stronger laterally.

The Itala Cars.

The display of **ITALA AUTOMOBILES, LTD.**, attracted throughout the show considerable attention, partly because of the prominent position given to the identical car on which Prince Borghese won the Pekin-Paris race, and partly to the high-grade qualities of these Italian-built vehicles. The chassis on view comprised a 35-45-h.p. four-cylinder model and a six-cylinder one of 60-h.p. (Fig. 119), the cylinder dimensions in both cases being 130 mm. bore by 130 mm. stroke. As regards the mechanical details of the Itala vehicles, these remain practically the same as last year. The cylinders are cast in pairs, and the ignition is by low-tension magneto, the operating cams being located on the top of vertical rods which run up between each pair of cylinders. The throttle is controlled both by pedal and a hand lever on the steering wheel. The automatic carburettor is of the Itala Company's own design and construction, a notable feature being that the induction pipes are provided with expansion joints. We note, too, that the dredger form of dashboard lubricator has been superseded by one comprising four small pumps which force the oil to

the various bearings. The clutch is of the metal-to-metal type, using flat discs, and is very sweet in action. A new departure is seen in the fitting of a large but light ring universal joint between the clutch and the gear-box to allow for any want of alignment between the two parts. The transmission from the four-speed gear-box is by a cardan shaft and bevel gear to a well-designed live axle. Three pedals are provided; one operates the clutch only, the other actuates a contracting brake on the primary shaft of the gear-box, while the central pedal withdraws the clutch and applies the expanding brakes in the hubs of the rear wheels; the latter can also be operated by the hand lever

Fig. 120.—The Engine and Gear-Box of the Motobloc Car, showing the flywheel located between the cylinders.

at the side of the driver. The cardan joints have metal cup protectors, and ball bearings are fitted throughout. A 20-h.p. car fitted with an Italian-built park phaeton body was also shown, this forming one of the most graceful vehicles in the Show.

The Motobloc Cars.

A vehicle which has many interesting points is the Motobloc, exhibited by the **BARTISH MOTOBLOC SYNDICATE, LTD.**, which is making arrangements for its construction in this country. Four sizes are made, all with four-cylinder engines—viz., 18-h.p. (90 mm. by 110 mm. bore and stroke), 25 h.p. (100 mm. by 100 mm.), 35-h.p. (120 mm. by 120 mm.), and 45-h.p. (130 mm. by 130 mm.). The first two have live axles, and

Fig. 121.—Three Views of the new Theraveroft 30-h.p. Engine. (See page 876.)

the more powerful cars have side-chain transmission. The name of the car is based on the fact that the engine and change-speed gear are built up in the form of a unit (Fig. 120). Another special feature is that the flywheel is enclosed, and is situated between the two pairs of cylinders, where it is supported on both sides by phosphor-bronze bearings of ample dimensions. The four cylinders are cast in pairs, and have the exhaust valves on one side, and the inlet valves situated in the centre of the cylinder heads, assuring a free and more direct transmission of gas; the inlets are actuated by rocking arms mounted on eccentrics, providing a simple and effective method of varying the

lift of the valves in order to regulate the speed of the engine. The automatic carburettor is heated by a supply of hot water from the cylinder-jackets, the temperature of which can be regulated by a tap provided for the purpose. The fuel feed is by exhaust pressure, which forces the petrol from the main reservoir to a small auxiliary tank on the dash, whence it is fed by gravity to the carburettor. Two systems of high-tension ignition, using the same contact maker and distributor, are provided. The magneto is mounted on a platform at the side of the gear-box, and driven by an extension of the pump shaft. The system of lubrication is on novel lines; a pump in front of the dashboard forces oil to the sight feed, and each drop of oil, as it falls from the latter, is picked up by another pump and forced through to its allotted bearing under pressure. The clutch, which is of the metal-to-metal expanding type, running in oil, is inter-connected with the throttle in such a way that as it is withdrawn by the pedal the speed of the engine is automatically cut down. The change-speed gear is controlled by a "gate" lever, the gears not in operation being automatically locked. A feature of the gear-box is the readily-detachable cover, which is held down by six hinged catches, these being released by merely slackening the nuts. The side shaft is hollow, and runs on ball bearings on a solid internal shaft, which can be withdrawn by unscrewing the large nut formed solid on its rear end, when the whole side shaft and its gears can be lifted out without disturbing any other parts.

The Thornycroft Cars.

An interesting series of cars, comprising 14-18-h.p. and 30-h.p. four-cylinder and 45-h.p. six-cylinder, was shown by Messrs. J. I. THORNYCROFT AND CO., LTD. The 30-h.p. four-cylinder car is in general arrangement a replica of the six, so that the following particulars may be taken as applying to both. Three views of the 30-h.p. are given in Fig. 121. The cylinders, which are $4\frac{1}{2}$ in. bore by 5 in. stroke, are cast in pairs, with the valves arranged on opposite sides. A gauge is provided for instantly determining the amount of lubricating oil in the crank chamber, and an air pump is driven off the cam shaft for forced petrol feed. The absence of sharp corners in the water service pipe is a special feature, as is also the design of the detachable front end portion of the crank case. The water-circulating pump and the magneto are located at the front of the engine, off which they are driven by skew gearing. The lever on the steering wheel is connected up to both the ignition and the throttle, the extra air inlet being automatically varied in conjunction with the latter. To facilitate starting the engine the exhaust cam shaft can be moved laterally to give half-compression,

Fig. 122.—The Benz 40-h.p. Four-Cylinder Motor, showing the gear operating the valve cam-shafts located at the rear of the engine. It will also be noticed that the pump and magneto are driven by separate shafts.

while it may also be mentioned that the exhaust pipe is provided with ribs to assist in cooling. The clutch is of the multiple-disc type, actuated by five readily-adjustable external springs. The transmission is through a three-speed gear-box and cardan shaft to a live axle. Messrs. Thornycroft, in addition to the six-cylinder chassis, exhibited a 30-h.p. three-quarter-landaulet; a 30-h.p. limousine (both of very high finish, and painted dark blue), and a 14-18-h.p. phaeton with Cape hood, the carriage work of the latter being by Messrs. A. Meier and Son, of Redhill.

The Benz Cars.

The name of Benz is one of the oldest in the automobile world, and one, judging from the models now being turned out, that is likely to long remain familiar. For some time past the Benz Company have been devoting attention to the construction of powerful high-grade vehicles, and the chassis displayed by the CANNSTATT AUTOMOBILE SUPPLY ASSOCIATION were amongst the finest in the show. The engine comprises four cylinders cast in pairs and with the valves symmetrically arranged on opposite sides. As will be seen from Fig. 122 a noteworthy feature of the motor is that the gear wheels operating

on the valve shafts are located at the flywheel end, instead of behind the radiator, as usual, an arrangement which is claimed to increase the available body space on the chassis without any drawbacks in the way of inaccessibility. It will also be noted that the water-circulating pump and magneto, while located on the same side of the engine, are operated by separate shafts. Two systems of ignition are provided, low tension magneto and high-tension by coil and accumulators, the distributor for the latter being mounted at an angle at the front end of the engine. The carburettor is of special design, a lever on the steering wheel controlling the throttle and at the same time varying the air inlet. The leather-faced type of cone clutch is retained, the transmission being through a "gate"-controlled four-speed to either a differential shaft and thence by side chains, or direct by a cardan shaft and bevel gear to the back axle, both methods of driving being supplied. The axles are of H section, and a peculiarity of the front one is that the centre of the axle and the centre of the wheels do not fall in line. The latter are set back from the centre, the claim for the arrangement being that, besides enabling simpler and more solid con-

Fig. 123.—The Iris 25-h.p. Landaulet.

struction of the axle arm pins, the steering is rendered surer and easier, and that when the wheels deviate on account of any unevenness on the road they at once come back to the straight of their own account. A 40-h.p. with luxurious limousine body by Hooper was also shown.

The Iris Cars.

The display of IRIS CARS, LTD., comprised a 25-h.p. three-quarter landaulet (Fig. 123), a 35-h.p. chassis, a 35-h.p. car with Roi des Belges touring body, Cape cart hood, wind shield, and high side door, a 40-h.p. chassis, and a 40-h.p. Pullman limousine. Since their introduction about two years ago, these vehicles, which are made at Willesden Junction by Messrs. Legros and Knowles, have quickly taken a prominent place in the ranks of British-built motor vehicles, and so satisfactory has the design of the various details proved that only a few minor changes have been found necessary in the 1908 models. The 25-h.p. and 35-h.p. vehicles are fitted with four-cylinder engines, while the 40-h.p. is a six-cylinder model which retains all the leading features of the Iris design. The cylinders are cast in pairs, with the valves all set on the same side; the bore is $4\frac{1}{2}$ in. and stroke $5\frac{1}{2}$ in. As in the four-cylinder, the lubrication is forced to all parts of the engine by a gear pump in the crank chamber, and driven off one of the cam shafts. Two systems of high-tension ignition are fitted, while to facilitate starting a half-compression arrangement is provided. The clutch is of the multiple-disc type, and the gear-box gives three forward speeds and reverse, with direct drive on the third. The gear case has a three-point suspension, and can be removed from the chassis by dismantling three nuts and bolts, while all the shafts, gear wheels, and bearings can be removed without taking the case from the chassis. The back axle casing is continuous from end to end, so as to avoid any possibility of sag at the centre. The road wheels are mounted on self-lubricating ball bearings upon the ends of the case, the power being transmitted from the live shafts to the hubs. The differential gear and the bevel wheels are carried in the aluminium case forming the centre of the axle in a novel manner, which enables them to be removed bodily in a few minutes without disturbing any of the other parts, and the ratio of the bevel gears to be readily changed.

Price's Lubricants.

From the beginning of the motor industry Messrs. PRICE'S PATENT CANDLE COMPANY LTD. have given close attention to the necessary lubricants, &c., and have met with a great degree of success in the preparation of various specialties for particular purposes. Among their several oils and greases for motor-cars are Motorine, Oleogene, Gas Engine Oil, Steam Motor Oil, Battersea Gear Oil, Belmoline, Belgraphine, Cirogene, Rangraphine, Rangoon Oil, Rangoon Jelly. An important speciality is Curroleum, which is an oil dressing for leather-faced clutches, which combines the properties of a lubricant and of a preservative for leather. Purity and quality are the secrets of the success of the Price's Candle Company in these lines.

The Pullcar.

One of the novelties of the show was undoubtedly the Pullcar vehicle exhibited by the PULLCAR MOTOR COMPANY, LTD., Preston. Since this car was first introduced the design has been considerably improved, and it would seem that, in view of the neat and graceful machines now being turned out, the Pullcar will soon become a very familiar type. A feature of the construction is that the engine and gear (Fig. 124) are all practically contained under the driver's seat and dashboard, power being transmitted to the front wheels, which thus

Fig. 124.—The Motor Fore-Carriage of the "Pullcar" Vehicle.

act as steerers and drivers. The arrangement gives the coachbuilder full scope for the carriage portion, the exhibit comprising an attractive-looking victoria suspended on C springs and a landaulet (Fig. 125), both exceedingly well adapted for town use. The motive power is supplied by a 14-16-h.p. engine comprising four separate vertical cylinders having the usual modern equipment in the way of ignition, carburation, water circulation, and lubrication. As will be seen, it is fixed in the frame with its crank shaft parallel with the axles; the power is transmitted by enclosed helical gear wheels to the change-speed gear counter-shaft below, and thence to the front axle by a Renold silent chain, no bevel gear being employed in the car, as the drive throughout is by parallel shafts. The change-speed gear is of epicyclic design, fitted, when required, with a patent locking device with automatic release. The gear is arranged to give three speeds forward and reverse—viz., 6½, 15, and 24 miles per hour with the motor running at 1,200 revolutions per minute. The gear wheels are always in mesh, being of the true sun-and-planet design, without a single internally-cut gear. On the top speed, on which the greater part of the running is done, no gear wheels are in operation, the gear being locked and revolving as a whole, acting as an additional flywheel. The combined driving and steering front axle is of the live type, the power being transmitted to it in the centre, and from thence to the road wheels through special universal joints. The axle is fitted throughout with Hyatt flexible roller bearings, which run constantly in oil. The differential gear and other component parts can be dismantled *in situ* without disturbing the carrying axle. Among the claims made for the Pullcar are that it does not skid, that solid tyres may be fitted to the rear wheels without interfering with the comfort of the passengers, and that the motor fore-carriage can be attached to any type of body.

The Calthorpe Cars.

The Calthorpe car, made by the CALTHORPE MOTOR COMPANY, LTD., John Bright Street, Birmingham, remains in its main features as in 1907, but in details and in refinements many distinct advances have been made. As was the case last year, only one type is manufactured, this being of 16-20-h.p. The cylinders, which are 93 mm. bore, with a stroke of 104 mm., are cast in pairs, with the mechanically-operated valves arranged on one side. The exhibits included a touring phaeton of standard design, a similar body being fitted to another example, but in this case a hood and glass screen is provided, completed by the customary polished chassis. Amongst the more important improvements effected, mention may first be made of the provision of the Brown and B-rlow automatic carburettor, which is claimed to effect very considerable economy in petrol consumption; a further improvement is the adoption of the Hele-Shaw clutch in all

models as a standard, whilst the difficulty sometimes experienced in the past in withdrawing the clutch has been overcome by the re-designing of the clutch pedal and levers, whereby a leverage in the ratio of six to one is secured by a double link motion, and under all circumstances the prompt withdrawal of the clutch is rendered absolute. Ball bearings are now fitted throughout the car, except in the motor itself, and, to ensure more perfect cooling, 32 ft. of gilled tube have been incorporated in the radiator. All control rods are now fitted with ball-joints of eminently practical design, ample wearing surface and the necessary provision for adjustments being provided. Splash lubrication and the fitting of the rear cross suspension spring are still continued, but the clearance for steering lock has been considerably increased.

The Motor Supply Company.

The MOTOR SUPPLY COMPANY, LTD., exhibited on their stand in the Annexe a 15-20-h.p. Mors car fitted with a handsome limousine body, a 10-15-Spyker car with a well-constructed landaulet body, and a 15-20-h.p. Spyker car with a side-entry touring body provided with a double-extension hood. A prominent place was also found for the popular little "Passe-Partout" car, for which this firm has the exclusive agency. The model displayed had a De Dion engine of 8-9-h.p., with automatic inlet valve, but we understand that the standard models are provided with motors fitted with mechanically-operated valves. The accessories are of the best—a Bassée and Michel coil, Dinin accumulators, and Autoloc control levers being fitted, whilst lubrication is by pressure feed, and the water circulation by a centrifugal pump. Although shown as a two-seated car, the car is also supplied with a long chassis for side-entry bodies. Three speeds are obtainable, and internal expanding brakes are provided immediately behind the gear-box and also on the rear road wheels.

The Cadillac Cars.

The ANGLO-AMERICAN MOTOR-CAR COMPANY, LTD., showed the Cadillac 10-h.p. single-cylinder car, which, except for detail improvements, remains unaltered. The wheel base has been increased, and longer springs are now fitted, while the riding qualities are improved. The 20-h.p. Cadillac is a new model shown for the first time, this having a vertical four-cylinder engine and cardan shaft transmission. There was also a 30-h.p. model fitted with a three-speed epicyclic gear.

The Mercedes-Mixte Cars.

A handsome 45-h.p. limousine built on a Mercedes-Mixte chassis was to be seen on the stand of the CANNSTATT AUTOMOBILE SUPPLY COMPANY, LTD. A feature of this vehicle is that the power developed by the petrol engine is transmitted electrically instead of mechanically to the rear road wheels, the usual clutch, gear-box, differential gear and driving mechanism being dispensed with, their place being taken by a dynamo at the rear of the engine and two electric motors built up to form the hubs of the rear road wheels. Changes of speed are effected by the action of a controller which alters the electrical connections. Five forward and three reverse speeds are available, as well as four electric brake positions. The exhibit also included a Mercedes electric

Fig. 125.—The "Pullcar" Landaulet.

carriage, in which the hub system of electric motors is employed, the necessary current being, however, in this case furnished by a battery of 42 Tudor accumulators arranged under the front and rear seats. A feature of the vehicle is the provision of a new regenerative controller, by means of which, whenever it is desired to stop the car or when running downhill, when the motors are being driven by the motion of the car itself, the latter are automatically converted into generators, the current generated going back into the battery. Not only does this intermittent recharging very much increase the distance that the car

will run on a single charge, but the frequent replenishing of the battery is beneficial to it, apart from the distance run, and a battery working under these conditions has a longer life than when used with the ordinary form of control. At the same time a powerful braking action is made available when the motors are used as generators. We may add that one of these vehicles recently made a run of 64 miles on one charge under the observation of the R.A.C.

The N.E.C. Cars.

The NEW ENGINE (MOTOR) COMPANY, LTD., of Acton Hill, W., had a display of their N.E.C. cars, which for originality of design were

Fig. 126.—The N.E.C. 40-h.p. Limousine built for Sir Thomas Brooks Hitching.

amongst the most interesting in the Show. Although at first the fact that the mechanism is entirely hidden from view may lead some to think that it is difficult of access, a perusal of the following description will show that, far from this being the case, the arrangement is such that all the different parts of the engine and gear can be got at with a minimum of trouble and without having to get under the car. Three sizes are being built—20-h.p. two cylinders, and 30-h.p. and 40-h.p. four-cylinder, all being fitted with horizontal opposed cylinders. Except as regards the number of cylinders, the arrangement of the vehicles is practically the same, so that the following particulars may be taken as applying to all three. In the first place it may be

stroke of the 20-h.p. and 40-h.p. engines is 5 in. by $4\frac{1}{2}$ in., while the dimensions of the 30-h.p. are $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in. The cam shaft and valve tappets are carried in a detachable case, which can be readily removed *en bloc*, so giving access to the crank shaft and its big ends. The ignition is by high-tension magneto-coil and accumulators with synchronised high-tension distributor being provided as a reserve. A governor is provided, by means of which the ignition is automatically advanced and retarded in accordance with the speed of the engine; it is also so linked up to the carburettor that the quality of the mixture is also varied in accordance with the motor speed. The lubrication is maintained by a pump mounted on the front end of the crank shaft; a range of sight-feed drips on the dash supplies oil to each cylinder and to the filter chamber. The crank shaft is hollow from end to end, and a constant stream of oil is kept moving through this passage, flowing out through small holes into the centre of each bearing. The oil then returns to the filter chamber, where it is thoroughly cleansed before again passing through the crank shaft. One gallon of oil will, it is claimed, run the car between 500 and 800 miles. The water circulation is on the thermo-siphon system, the fan being incorporated with the flywheel. The usual bonnet is replaced by the dashboard, which consists of the radiator and a wooden case serving to hold the petrol and oil tanks. The clutch is of the leather-faced cone type; the epicyclic change-speed gear has been abandoned in favour of a four-speed gear-box operated by a "gate" lever. On the fourth speed a direct drive is obtained, but on the other speeds, including the reverse, separately mounted eccentric lay shafts controlled by cams are employed, the gear wheel being thus engaged on the full width of the teeth in place of being slid into engagement sideways. The transmission from the gear-box to the rear live axle is by a cardan shaft which has universal joints at both ends and worm gear, the worm engaging with its corresponding wheel below the axle. The latter is entirely encased, and runs on ball and roller bearings. The sleeve surrounding the two parts of the divided driving shaft is of steel tubular construction, facing and bolting on to a central cylindrical casting containing the differential and worm drive. As already mentioned, special attention has been devoted to the accessibility of the mechanism, every part of which is arranged so that it can be got at from the top or sides of the vehicle, which are made removable or hinged. As there is nothing to get at underneath the engine, a close-fitting underscreen is fitted, the motor and gear being thus thoroughly protected from dirt. The vehicles exhibited comprised a 20-h.p. and 30-h.p. landaulet and a 40-h.p. limousine (Fig. 126), the bodies being entirely supported between the axles and rendering them exceedingly comfortable. In fact, the whole of the appearance of the N.E.C. cars is one of comfort, and we are not surprised to find them rapidly becoming a popular type.

The Belsize Cars.

BELSIZE MOTORS, LTD., as this old-established Manchester concern is now known, are building six models for the 1908 season—15-h.p., 20-h.p., 28-h.p., and 30-40-h.p. four-cylinder, and 30-h.p. and 60-h.p. six-cylinder

S. Gear changing lever.
T. Steering column.
W. Hand Brake.

observed that the body is entirely supported between the axles; special attention has been paid to the question of suspension, with the object of providing an easy-riding vehicle. The frame is of channel steel, the side members being narrowed at the extreme front and connected by transverse members, the whole being stiffened at the angles by web plates. The springing of the car is novel, half-elliptic springs being placed fore and aft, and connected underneath the axle at the back and on the top in front. The motor, as will be seen from Fig. 127, is located below the front seat floor board. The cylinders, which are separately cast, are arranged in pairs on the opposite side of the base chamber, the valves being all operated off a single cam shaft. The bore and

—all having bevel-gear-driven live axles. The 15-h.p. car has the cylinders— $3\frac{1}{2}$ -in. bore by 4-in. stroke—cast in one piece. The ignition is by high-tension magneto, and the water cooling is by thermo-siphon circulation. The 20-h.p. car is similar in all respects to that which secured the gold medal in its class at the Scottish trials. The 28-h.p. is a new model, and has many interesting details, including special oil pump. The bore is $4\frac{1}{2}$ in. and the stroke 5 in.; the valves are located on opposite sides. High-tension magneto ignition is fitted, and the cooling is on the thermo-siphon system, large pipes being used. The tappets, guides, and valve spindles are hidden from view by an easily-removed twin semi-cylindrical casing, which reduces the noise due to the impact of the valve spindles.

on the tappet ends. A metal-to-metal cone clutch running in oil transmits the power to the gear-box; the latter gives four forward speeds in addition to the reverse, the direct drive being on the third. The usual practice with regard to the brakes is reversed, the pedal controlling the rear wheel hub brakes, and a side lever one on the end of the gear-box. With the exception of the engine, ball bearings are employed throughout. The 30-h.p. six-cylinder vehicle is a new model; the cylinder dimensions are 4-in. bore by 4½-in. stroke. As will be seen, the Belsize Company have an interesting series of cars for the coming season, and in view of the relatively low price at which they are being offered, are deserving of close attention.

The "Valveless" Cars.

One of the most interesting vehicles in the Show was the "Valveless" of Valveless, Ltd., and exhibited on the stand of Messrs. CRAWSHAY, WILLIAMS, LTD. Fig. 129 gives a view of the 20-h.p. chassis displayed, while the exhibit also comprised a landaulet with front extension and wind screen to seat six. The main feature of the chassis is, of course, the engine, which works on the two-cycle system, and has neither valves, valve tappets, nor cam shafts. Fig. 128 gives a section view of the motor, from which it will be seen that it has two vertical cylinders placed side by side, sharing in common a single combustion chamber, carburettor, air-tight crank case, inlet port, exhaust port, and ignition. The two pistons B operate separate crank shafts CC1, which revolve in opposite directions, being geared together by teeth cut on their disc webs. The gearing is so arranged that the pistons move up and down together, while on each crank shaft there is a balance weight. The bore and stroke are respectively 5¼ in. by 5½ in. The action of the engine is as follows:—When the pistons ascend, the vacuum which they form in the airtight crank case draws air in through the passage G. This air lifts the disc V, which is attached to the needle valve S, so that petrol is sprayed from the jet K into the passage I. The pistons then descend and compress the charge of air in the crank case. On reaching the bottom of their stroke they uncover the ports D and E. The opening of the port D permits the charge of compressed air to pass from the crank case through the passage I into the cylinders. On its way the air is carburetted by the petrol which has already been sprayed into the passage I. The mixture so formed displaces the waste gases from the cylinders, pushing them out through the exhaust port E. The pistons then ascend, and compression is followed by explosion in the usual way. As the pistons approach their extreme downward position, the exhaust port first opens and lets out the remaining pressure of the explosion, and then the inlet port opens and lets in a fresh charge as already described. In fact, while one charge is being used in the cylinders another is being prepared in the crank case, so that explosion takes place at every revolution, as against every other revolution in the ordinary four-cycle engines. As will be seen from Fig. 129, the engine is placed at about the centre of the frame under the driver's seat, so that the radiator, which occupies the front of the car, can lie at

the receiver at regular intervals thus ensuring the efficient lubrication of the entire mechanism. The ignition is by coil and accumulators, the two cylinders being fired by a single plug. A notable feature is that the installation is in duplicate throughout, so that in the event of a defect in one series of wires the reserve can be immediately switched on. The power is transmitted through a metal cone clutch which works in oil to a Renold silent chain, which drives a secondary shaft carrying a double-jaw clutch. Two speeds are obtained by en-

Fig. 128.—Section of "Valveless" Two-Cycle Engine.

gaging the jaw clutch with two chain wheels which drive on to the axle at different speeds by means of ordinary roller chains. The reverse motion is accomplished by an epicyclic gear contained inside the main clutch. The gear is motionless during the forward running of the car, but it is instantly brought into action when the clutch pedal is pressed down beyond its usual travel. The ease with which either forward or backward movement can be obtained by a single movement of the driver's foot renders the car extremely convenient to handle in an

Fig. 129.—Chassis of the Valveless 20-h.p. Car.

a considerably higher level than the cylinders. By this arrangement a rapid circulation of the cooling water is obtained without the use of a pump. The tubes of the radiator are disposed horizontally, and afford a free passage to air passing vertically between them. The lubrication of the motor is effected by a pump operated by worm gear off one of the crank shafts. The oil is taken through a distributor in view of the driver to the pistons and bearings of the engine, and is afterwards ejected on to the chains and other working parts, the mere filling of

awkward garage, and when the vehicle is blocked by traffic enables the driver to back immediately by merely forcing down the clutch pedal. The epicyclic gear is of use also for another purpose. The engine, since it goes through the same cycle of operations at every revolution, will run equally well in either direction, and can, in fact, be easily reversed from the driver's seat by a single manipulation of the ignition lever. When the engine is reversed the reverse becomes a very slow forward gear (giving less than half the speed of the nominal low gear).

The frame of the vehicle is on novel lines; it is constructed of thin steel plate in the shape of a punt 16 in. deep, and forms at the same time an extremely rigid support for the body and a dust-proof case for all the working parts, a steel casing being formed over the driving chains. The central steel tube containing the live shafts of the back axle is relieved of all strain by a sheet steel framework. The springs are full elliptic, and ensure easy running, even on the worst roads. Two extremely powerful brakes are fitted, the foot-operated one acting on a drum on the clutch shaft, those controlled by hand lever working on drums on the driving wheels. The vehicle, which is the outcome of several years' close study on the part of Mr. Ralph Lucas, is exceedingly quiet in operation. It is claimed that the "Valveless" engine obtains with two cylinders a greater freedom from vibration than either the four-cylinder or six-cylinder motor of the ordinary type.

The Hillman-Coatalen Cars.

A new addition to the ranks of British-built cars is the Hillman-Coatalen, built by the HILLMAN-COATALEN MOTOR CAR COMPANY, of Coventry. Two models are being made—25-h.p. four-cylinder and 40-h.p. six-cylinder—examples of both of which were on view. Except as regards the number of cylinders, the general arrangement of the two vehicles is on the same lines. The engine has separately-cast cylinders, the bore being 5 in. by 5 in. stroke. The design is of interest in that the crank case carries almost all the parts that can be classified as belonging to the engine. Cooling is by a gear-driven positive pump and a novel type of flat-tube radiator. A feature of the six-cylinder car is the employment of two water-circulating pumps driven off one shaft. The ignition is by high-tension magneto with fixed firing point; coil and accumulators are also installed as a reserve. The crank chamber is provided with two large inspection doors, enabling the big end bearings to be readily examined. The clutch, which is of the leather-faced cone type, has two side springs in place of the usual central one. The change-speed gear gives three forward speeds, with direct drive on the top. A double-jointed cardan shaft transmits the power through bevel gearing to the rear live axle. The weight of the

Fig. 130.—The Hillman-Coatalen 25-h.p. Car.

car is taken by the axle casing, the live shafts, which have only the driving effort to withstand, transmitting the power to the rear road wheels through their hexagonally-shaped ends. With the exception of the engine, ball bearings are used throughout.

The Sizaire-Naudin Car.

The interesting little two-seated car known as the Sizaire-Naudin, the agents for which in this country are Messrs. JARROTT AND LETTS, continues to attract considerable notice, the success of this vehicle in the recent light-car trials in France having given it a decided fillip. Throughout the details of the car are on novel lines; the frame is of armoured wood suspended on three springs; the engine is of the single-cylinder type—120 mm. bore by 110 mm. stroke. A governor acting on the ignition is provided, while the speed of the motor is controlled by a variable lift of the inlet valves. Transmission is through a single metallic-disc clutch and a special form of three-speed gear-box, giving a direct drive on all speeds. The change-speed gear is combined with a special system of transmission to the live axle. Fitted with a two-seated body, the little car has quite a racy appearance, and its moderate price is bringing it many purchasers.

The Horley Car.

The HORLEY MOTOR AND ENGINEERING COMPANY, LTD., showed two models of their 8½-h.p. cars, fitted in both cases with four-seated bodies. So far as the motive power is concerned, they are identical, the two cylinders, having a bore of 80 mm. and 90 mm. stroke, of Messrs. White and Poppe's manufacture, this firm's carburettor being also employed. In the cheaper model the control is by Autoloc levers on the steering column, a friction-driven pump maintaining the water circulation, a tank and radiator with fan being provided. In this car the contact breaker is placed horizontally at the top of the cylinder, the ignition being by accumulator and coil. In the second model, whilst the engine, carburettor, and ignition are the same, the contact breaker is placed vertically, the pump is gear-driven, and the radiator is self-contained.

The suspension, too, is improved, a transverse spring at the back being provided. Steering wheel control is fitted. In other details this type follows the first-described model.

The N.A.G. Cars.

The NEUE AUTOMOBIL GESSELLSCHAFT showed two models of their cars—a 16-h.p. four-cylinder type being fitted with a landaulet body by the Connaught Motor and Carriage Company, Ltd., the British agents for these vehicles, and a 28-32-h.p. chassis fitted with a double landaulet finished in bright yellow, by the same makers. In addition an example of the 28-32-h.p. type was to be found in chassis form, specially finished for exhibition. The latter has cylinders cast in pairs, with a bore of 115 mm. and a stroke of 125 mm., the whole of the distribution gears being encased, and the valves placed symmetrically on either side. The ignition is by low-tension magneto, the ignition gear being actuated by vertical rods worked from the induction cam shaft, the advancement being attained through the medium of a lever and sector on the steering wheel. Cooling is effected through a gear-driven pump on the exhaust side, a peculiarly designed gilled tube radiator and a fan being fitted. The peculiarity of the radiator is that its central element or nest of tubes can be taken down for repair, replacement, cleaning, &c., without in any way disturbing the remaining nests or breaking the ordinary water-joints. The transmission is by chains from a gear-box providing four speeds, controlled by a lever working in a "gate" sector, direct drive being given on top speed. The male member of the clutch is of the leather-faced cone type, but in this instance the leather is attached to segments, so that the ease of dismounting is rendered particularly facile. A contracting brake is fitted to the secondary shaft in front of the gear-box and internal expanding brakes to drums on the rear road wheels, these also being provided with an ingenious ratchet device which acts as a sprag. The carburettor is improved from that of previous models. A hot-air chamber is provided around the exhaust pipe, a method of controlling the choice of admission of either hot or cold air being provided by a shutter controlled by a lever working in a ratchet, a further shutter at the other extremity controlling the fixed air supply. Lubrication is by pressure from the exhaust to the dash, and thence by pumps through two sight feeds; an ingenious mounting of the glass tube in brass fittings with bayonet catches permits of the removal of these sight tubes instantaneously and without interference with the lubricator. The 16-20-h.p. model is similar to the 28-32-h.p. car, except that the cylinder dimensions are 90 mm. by 110 mm., and that in this model the change-speed gear permits of only three speeds, and finally that the transmission from the gear-box is by a cardan shaft to the live axle.

The Nagant-Hobson and Decauville Cars.

Interest at the stand of Messrs. H. M. HOBSON, LTD., was centred in the chassis of the Nagant-Hobson 35-40-h.p. car, which is built by the old-established engineering firm of Messrs. Nagant Frères, of Liege. The engine comprises four cylinders, 125 mm. bore by 140 mm. stroke, cast in two pairs, with the valves arranged on opposite sides. The ignition is by low-tension magneto, provision being also made so that coil and accumulators may be employed as a reserve. A half-compression device is provided to facilitate the starting of the engine. The clutch is of the disc type, a neat clutch stop being provided to facilitate changing gear. The change-speed gear is adapted to give four forward speeds and a reverse with "gate" control and direct drive on the top speed, the final transmission being by side chains. Two brakes are provided on the differential shaft in addition to the usual internal expanding ones on the rear road wheels. The frame is of pressed steel, and the front axle is of I section, ball bearings being fitted to the pivots—in fact, to all parts except the engine. A new shock absorber known as La Glissoire, and which acts by the displacement of oil, is fitted in conjunction with the springs. The complete car on view was fitted with a side-entrance double phaeton body fully equipped for touring, it being provided with canopy and special wind screen placed close up to the steering wheel. Drawers are arranged under the seats and under the footboards, and a feature is the addition of a spare seat on the near side footboard. A new 20-30-h.p. model on similar lines has just been introduced. Except that two brakes instead of three are fitted, and that the ignition is by high-tension magneto and accumulators and coil, this is on similar lines to the 35-40-h.p. car. A 16-20-h.p. Decauville landaulet was also shown, this being practically unaltered, except for the gear being lower than formerly, so that the bulk of the driving can be done on top speed. The body, which is by Messrs. Laurie and Marner, is painted green and upholstered in Bedford cord, making an excellent carriage for town use.

The West-Aster Cars.

In their main features the various types of West-Aster cars exhibited by Messrs. WEST, LTD., resembled each other, excepting that the horse-powers varied from 14-16-h.p. to 30-35-h.p., a 22-h.p. forming a connecting link between the two. The two last mentioned are provided with a gear-box giving four speeds, whilst the 14-16-h.p. has only three speeds. In addition, the 14-16-h.p. engine has its four cylinders in one casting, whilst in the 22-h.p. they are cast in pairs, and in the remaining type separately. The transmission is by propeller shaft to a live axle in each case; the firm's well-known practice of carrying the propeller shaft from a hinged double link or stirrup

attached to the central cross member of the main frame is adhered to, as is also the self-oiling double universal joint. The West cars have always been known for the excellent coach-work embodied even in the standard bodies as ordinarily fitted, and it would be difficult to surpass in luxurious elegance and quiet refinement the various models shown. One comprised a touring phaeton of the Roi des Belges type finished in green and black alternating stripes, upholstered in crimson enamelled buffalo hide; another a luxurious limousine of the semi-berline type, finished in rich dark green with black mouldings lined out in white, the upholstery being in heavy cloth fabric of mixed green tints; and yet another a limousine-landaulet body, finished in dark green with black mouldings, upholstered in drab cloth. The exhibit was completed by examples of the gears, axles, &c., employed in the cars and an example of the Noakes lubricator.

The Porthos Car.

A vehicle which attracted considerable attention was the Porthos, exhibited by Messrs. COLIN DEFRIES, LTD. Two models were on view—24-32-h.p. four-cylinder and 50-h.p. six-cylinder. The engine comprises separate cylinders, with the valves arranged on opposite sides. The ignition is by high-tension magneto, while the carburettor is of special automatic type, the extra air valve being opened by means of a leather diaphragm, on which the suction of the engine acts. Another feature of the carburettor is that the vaporising and mixing chambers are separate. The lubrication of the engine is effected by a small pump built in connection with and operated by one of the exhaust valve tappets. The transmission is through a leather-faced cone clutch, four speeds and reverse gear-box, with direct drive on top, cardan shaft and bevel gear to a live axle. The latter forms a somewhat novel departure from the ordinary practice, the usual design being practically reversed—that is to say, the power is transmitted to the road wheels through hollow sleeves, which, instead of being fixed as usual, rotate in ball bearings. The weight of the car is carried by a solid shaft which extends in one continuous piece from wheel to wheel, and which also rotates with the wheels. The differential is of the parallel pinion type, and the intermediate pinions have been made much longer than usual, so that the driving gear is, to a certain degree, free to move laterally on the driving sleeves and so adjust itself to any strains which might otherwise tend to disturb the correct meshing of the bevel gears. This "floating" action is facilitated by the absence of torque rods, the natural tendency to turn being resisted by the casing provided around the cardan shaft.

The Lindsay Cars.

The LINDSAY MOTOR MANUFACTURING COMPANY, LTD., are now confining their attention to a 16-h.p. vehicle, the chassis of which is adapted to receive any type of closed or open side-entrance body. The motor has four separately-cast cylinders, with the valves all on one side. Both high and low tension are provided, and the carburettor has an automatic air inlet valve. The specification comprises forced feed lubrication, cone clutch, three speeds forward and a reverse, ball bearings to all parts except the engine. The final drive is by cardan shaft to a live axle.

The Roydale Cars.

The ROYDALE ENGINEERING COMPANY, Huddersfield, were present with two polished chassis of the Roydale vehicles of respectively 18-22-h.p. and 25-h.p., both having engines the four cylinders of which are cast in one piece. There are many points of interest in these vehicles, which made their *debut* at the Cordingley Show in April last, among them being a two-jet by-pass carburettor, which is very simple in its action, while allowing the mixture to automatically adjust itself according to the speed of the motor. Ignition is by Simms-Boach high-tension magneto, accumulators and coil being provided as a reserve ignition system as a stand-by. The throttle is arranged to be operated in three ways—by a hand lever on the steering wheel, by an accelerator pedal, and automatically when the clutch is withdrawn. The ball-bearing gear-box furnishes three forward speeds, with a direct drive on the top, through a double-jointed propeller shaft to a live axle.

The Pilgrim Cars.

The cars exhibited by the PILGRIM'S WAY MOTOR COMPANY, LTD., were of an exceedingly novel design, and radically different to what may be termed standard practice. The exhibit comprised a three-quarter landaulet and a double landaulet, as well as a chassis and a neat two-seated car. The engine, which is mounted in the centre of the frame, comprises four horizontal cylinders all located on the same side of the crank shaft. The cylinders, which are $4\frac{1}{2}$ in. bore by 5 in. stroke, are cast separately but complete with water-jacket. The cam shaft is arranged so that it can be quickly detached, while the large inspection doors fitted to the crank chamber enable a piston to be withdrawn without it being necessary to dismantle the engine. The system of lubrication is an improvement on the 1907 model, a valveless or oscillating pump located in the crank case forcing the oil from the base chamber through a distributor to the different bearings, the oil returning to the tank to be repumped. The transmission is through an epicyclic type of change-speed gear, providing two forward speeds and a reverse. The gears are automatically operated by one pedal and

an indication lever, which can be set at any time to the gear required. The final drive is by a single central chain, which is enclosed. Other features of the car are the self-starting device and the adjustable steering gear and the fact that only five sizes of nuts are used throughout the chassis.

The North British (Drummond) Car.

This car was shown in chassis form and also equipped with a touring body on the stand of Mr. A. C. PENMAN, of Dumfries. In its main features it remains as originally designed, the chief variations being in minor details and in giving increased accessibility, &c. The motor (Figs. 131 and 132) has its mechanically-operated valves on one side of the cylinders, which have a bore of $3\frac{1}{2}$ in. and a stroke of 4 in., giving 20-h.p. at 1,500 revolutions. Cooling is on the thermo-siphon system through a well-designed radiator carried in front of the bonnet in the usual manner. Ignition is by high-tension from accumulators and trembler coil, but at choice synchronised ignition can be fitted, and provision is also made for a high-tension magneto as an alternative. The carburettor is of good design, ensuring flexibility, and testimonials from users give proof of an average of twenty miles to the gallon with four or five seated bodies. Lubrication of the engine is effected by splash, all other rotative parts being provided with grease cups. The clutch is of the leather-faced cone type, and the transmission from the three-speed gear-box is by propeller shaft to the live axle. A contracting brake is carried behind the gear-box, each road wheel being provided with internal expanding brakes. The steering is irreversible and adjust-

Figs. 131 and 132.—Two Views of the Motor of the North British (Drummond) Car.

able, enabling the inclination of the pillar to be set at any desired angle; the wheel carries the control levers, a decelerator pedal also being fitted. The back axle is of great strength, the differential being of the parallel type of large proportions. Both the engine and gear-box are hung on steel plates, being extensions from the main frame, and provided with a dust-excluding apron. Another model of the same horse-power is constructed to carry a two-seated phaeton de luxe. In this case, whilst most of the foregoing details of construction are retained, the drive is attained by a worm floating on a feathered shaft and held in position by springs at either end. These cars have already acquired a good reputation for ease, flexibility, and lightness in fuel and tyre consumption in the North, and for steady reliability their reputation is being daily augmented.

The Aster Cars.

In addition to their display of engines in the Gallery, the ASTER ENGINEERING COMPANY, LTD., had on view two complete chassis of respectively 20-22-h.p. and 24-30-h.p. The motors are of the four-cylinder type, and are equipped with Longuemare carburettors, to which the Aster Company's automatic attachment is fitted. Two systems of high-tension ignition are employed. The transmission is through a three-speed gear-box, giving a direct drive on the top speed. The front axles are of a new pivot design, with the hubs of the road wheels running on ball bearings.

The Ariel-Simplex Cars.

ARIEL MOTORS (1906), LTD., had an interesting display in the centre of the main building, the carriage bodies fitted to the various chassis being of the most elaborate type. They included a very handsome double landaulet fitted to a 30-40-h.p. chassis, finished in dark blue, and possessing much originality in design, a limousine finished in dark crimson attached to a chassis of 40-50-h.p., and a touring phaeton with all necessary equipments, completed in deep cream colour, with brown-red mouldings and upholstery, applied to a chassis of 30-40-h.p.

Fig. 133.—The Ariel 25-30-h.p. Motor.

Although, as was their due, these well-known models attracted considerable attention, yet the *clou* of this exhibit was the firm's new 25-30-h.p. chassis (Fig. 134), its popularity perhaps being divided with the racing car built for the Grand Prix of 1908. In the 25-30-h.p. new model the usual Ariel practice of casting the cylinders (Fig. 133) in pairs has been adhered to, and the valves, as usual, are placed on one side of the cylinders, the inlet valves being located over the exhausts and operated by rocking levers through vertical rods. In main design the remaining features of the motor follow the usual practice of this firm. The lubrication is by means of a gear-driven

shaft to the four-speed gear-box, the selector rods of which are now entirely enclosed, and are operated through a "gate"-type sector by a single lever. The gear-box is suspended on a tubular underframe carried at its rear end on a tubular cross member of the main frame and at its front end by a downwardly-bent tubular cross member, which also serves as a fulcrum for the clutch withdrawal mechanism. Lubricators are fitted to all moving parts and to the spring shackles. A contracting brake is fitted behind the gear-box, and the rear road wheels carry internal expanding brakes whose action is synchronised by a rocking lever. Both the gear-box and back axle are, of course, fitted with ball bearings throughout. The frame is inswept at the front and cambered at the rear, the rear suspension being by three-quarter elliptic springs.

The Isotta-Fraschini Cars.

These high-grade Italian-built cars have quickly gained a prominent position in the motoring world. Two sizes were exhibited by Messrs. HALL, CAPRIS AND Co.—18-24-h.p. and 40-45-h.p.—both being fitted with side-chain transmission. The four-cylinder engine has the valves operated off separate cam shafts, and the ignition is by high-tension magneto. The flywheel is adapted to act as a fan, while the clutch is of the multiple disc type. On the smaller car the usual brake on the differential shaft is supplemented by one on the forward end of the gear-box side shaft, while the larger one has two brakes on the countershaft. The cylinder dimensions are: 18-24-h.p. 105 mm. bore by 130 mm. stroke, and 40-45-h.p. 130 mm. by 150 mm. Messrs. Hall, Capris and Co. inform us that a new live axle model is being introduced by the Isotta-Fraschini Company, this being fitted with a 14-h.p. four-cylinder engine, a straight or dropped frame—the latter being intended for low side-entrance town carriages—and an arched back axle, this construction being rendered possible by the adoption of two pairs of bevel wheels with the differential casing.

The Rothwell Cars.

The ECLIPSE MACHINE COMPANY, LTD., exhibited three sizes of their live-axle cars—15-h.p., 20-h.p., and 25-h.p. The water circulation is by thermo siphon, no pump being used. A feature is the accessibility of the valves, it being only necessary to loosen one nut to take out both valves in the same cylinder, while large inspection doors allow of easy inspection of the interior of the crank chamber. The leather-faced cone clutch is fitted with an addition in the shape of rubber buffers, engaging with apertures in the cone, to allow of progressive engagement. The road wheels are of the double-artillery type.

Coach Work for Motor Cars.

An inspection of the chassis on the stand of Sir WM. ANGUS, SANDERSON AND Co., Westgate Street, Newcastle-on-Tyne, revealed more than any words can describe the high grade work which is now

Fig. 134.—Chassis of Ariel 25-30-h.p. Car.

pump operated from the cam shaft. The clutch is of the inverted cone type faced with leather, a ready means of adjustment being provided by an external square-headed nut operating the internal mechanism. The carburettor is carried on the side of the motor opposite the cam shaft, and the feed is by a double-armed casting through ports in the cylinder heads to the inlet valves on the other side of the engine. The magneto and water-circulating pump are also on the right side of the motor, being driven by the same shaft from the distribution gear. From the clutch power is conveyed through a double cardan-jointed

being put upon the chassis of automobiles in order to bring them into line with the best carriage work of the country. There were two examples which would make the reputation of the firm—if that had not been already assured. One was a 42-h.p. Daimler limousine to the order of Mr. Emerson Bainbridge, ex. M.P., constructed on coach lines even to the driver's seat, which instead of being a part of the enclosed vehicle, is independent of that portion of the body like the coachbox. At the rear, too, the luggage grid can be folded up so as to preserve the carriage outline when not in use. This limousine has a fixed top. The pillars are

swung up, and by means of a double acting hinge are secured to the roof out of sight, while the glasses of door and sides can be dropped into the panels of the vehicles as in an open car. The convenience of the driver, as well as the comfort of the passengers, has been thought of, and the slope for his feet is at an extremely good angle. As an example of carefully designed internal fittings, the landaulet on a 42-h.p. Daimler chassis, also the work of Messrs. Sir Wm. Angus, Sanderson and Co., was noteworthy. In addition to the usual seats in the rear of the vehicle are swinging seats at the sides which can be adjusted to several positions so as to facilitate the movement of passengers. These seats can be folded away and collapsible tables brought into position to extend across the car and form a complete barrier. To the rear of the driver there is another collapsible seat. A special fitting is a semi-circular canteen, divided into three compartments, which is enclosed under the rear seats, and which revolves so as to afford entry thereto. The upholstery of the interior is in a taking French material of light grey. The driving seats are in pigskin, with a bucket division for maps, etc. A notable feature of both these vehicles is the exceptionally wide wings, which are covered with leather. Each of these can be easily removed, when it is desired to get to the tyres, by removing three bolts, which are, however, hidden from view on the uppermost side.

Motor Bodies from Scotland.

From Dumfries Mr. A. C. PENMAN brought admirable examples of motor body work. His reputation is not restricted by the Solway Firth, and his clientele extends to the southern shore of this island. An examination of the various bodies on the stand went far to explain his success. The 24-h.p. "Deasy" three-quarter landaulet is a good design. Within are folding seats which fall into the floor when down, thus being right out of the way. In their place a writing table can be obtained, and with the advantage of a roomy interior the carriage—for such it really is—is an ideal society vehicle. In connection with the electric sidelights the switch is located near the lamp to facilitate removal, &c. The second vehicle in the collection was a 24-30-h.p. "New Arrol-Johnston" limousine with a detachable top. This is so well contrived as to disguise the fact to the ordinary observer. The colouring is in two shades of blue, which form an artistic and unusual combination. To this car is fitted the "Millaro" wind screen, reference to which has been made in an earlier Show Report. The third car on Mr. Penman's stand was a 16-20-h.p. "North British" tulip phaeton of a type that has become popular in the north. The body is in polished walnut, and in the rear portion no fewer than 150 pieces of wood have been used to secure the rounded form. For the comfort of the passengers the floor boards can be raised to any angle so as to rest the feet, a convenience secured by having a double floor. Altogether these exhibits testified to most careful design, as well as good workmanship—a combination that led to an excellent display of modern motor body work.

Vincent Motor Bodies.

Although his stand in the Annexe was of restricted area, Mr. W. VINCENT tagged thereon a magnificent example of coachwork applied to a Mercedes chassis of the latest type, whilst other examples of his manufacture were to be found displayed on the stands of Messrs. Mann and Overton's and Straker and Squire, Ltd. Both the last-mentioned examples are of the double phaeton type, that fitted to the Brasier car being finished in carmine, with hood and wind screen, and that displayed on the Straker-Squire "C. P. B." 25-30-h.p. car, built for the Maharajah of Bikaner, being completed in beautiful shades of green, upholstered in a light green leather in pastel tint. The Mercedes chassis on Mr. Vincent's own stand was equipped with a "runabout" body *de luxe*, in single or "Parisian" phaeton form with a hood. As is usual with bodies of this firm's construction, every possible refinement is comprised; tool-boxes and tool-drawers are made weather-proof, with double doors or lids, each cover being double-grooved and tongued. The upholstery is a perfect example of the coachbuilder's art, and is carried out in enamelled hide of a delicate green tint, whilst the paintwork is completed in three shades of dark greens, the whole harmonising perfectly. The body of the phaeton has its corners composed of a chamfered panel, the mouldings of which conform in artistic contour with the side and back panels, and the complete vehicle possesses an artistic merit, as well as a comfortable elegance.

Lowe, Bevan and Co.'s Wind Screens.

A large and effective display of their wind screens and motor body builders' specialities was made by Messrs. LOWE BEVAN and Co., of the Clarence Works, Birmingham. Among the new patterns for the coming season, all of which seem to have been designed with a practical appreciation of the problem to be solved, is the "Kenilworth" type with patent fittings, by means of which any angle of adjustment can be secured. The combinations that are obtained are most comprehensive. The screen is in two halves, which can be used as one straight screen if desired; or the bottom portion can be used that way with the top member adjusted to any required angle. If necessary it can be half folded down to form a half screen. Supplied with either brass or nickel-plated fittings, the screen is a thoroughly practical device. Another useful invention exhibited by Messrs. Lowe, Bevan and Co. was the "Combination" folding wind screen which combines in one all the various positions given by most of the screens familiar to

motorists. In other words, it gives a range of five positions, viz., a straight screen, half, bottom half angled, top half to open outwards, bottom half straight, and top half angled towards steering wheel. All kinds of motor body fittings were also shown, many ingenious joints and hinges being introduced into their construction. A special point is made of close plating and electro-plating in all branches.

The Duplex Two-stroke Engine and "Simple" Variable Speed Transmission.

THE MOTOR ENGINE AND MANUFACTURING COMPANY, LTD., had on view a 30-40-h.p. four-cylinder car, the feature of which lies in the Duplex two-stroke engine with which it is fitted. An illustrated description of the motor was given in the *M.C.J.* about a year ago, and, although a few modifications have been introduced in the details, the principle remains the same. The disposition of the valves for delivering the mixture to be compressed in the cylinders has been altered, there being now no overhead valve, the inlet being situated at the bottom of the stroke, exactly opposite the exhaust, the piston controlling the entire inlet and exhaust operations. In common with most types of two-stroke engines, the incoming of the new charge and the outgoing of the exhaust is governed by the piston, the engine being therefore valveless, cam shafts and tappets being consequently unnecessary. The Duplex differs, however, from the usual two-stroke motor, inasmuch as there is no crank-case compression, and the air enters the working cylinder in advance of the combustible mixture, preventing back-firing and allowing the engine to run at very high speed. The working parts are only three per cylinder, viz., (1) piston, (2) connecting rod, (3) crank. Each of the cylinders consists of two chambers, and the explosive charge is first drawn into the bottom chamber of one cylinder and is

Fig. 135.—The "Simple" Variable Speed Transmission Gear.

passed to the top or combustion chamber of the second cylinder with a cushion of pure air in front of it, which effectively "scavenges" or drives before it the burnt gases resulting from the explosion which has just taken place in that cylinder. The advantage of air scavenging in high-speed engines is well known, but so far it has not been possible to utilise this without grave complication, the engine being expensive to manufacture, and the consequent liability of getting out of order. Under the Duplex patent these advantages are obtained by means of the three working parts named. A further advantage claimed for the Duplex engine is that, although the crank case is not utilised as a pump, no auxiliary pumps are employed. The engine is entirely self contained, and when the gas is shut off a very powerful air brake is obtained. The mixture is furnished by a T. and M. three-jet carburettor, and the ignition is by high-tension magneto. The car shown was fitted with the usual pattern of sliding change-speed gear and cardan shaft transmission. Arrangements have, however, been made to adopt, when desired, the "Simple" variable speed transmission gear introduced by the Simplex Motor Gear Syndicate, Ltd., of Goschen House, Henrietta Street, London, W.C., and a working model of which was to be seen at the stand of the Motor Engine and Manufacturing Company, Ltd. As will be seen from Fig. 135, this consists essentially of two expanding pulleys J and J' and a combination chain belt K, by means of which the drive is obtained. The expanding pulleys are built up of two wings, in each of which radial slots are cut in such a way that in each conjugate pair of wings the slots alternate, the solid portions of one wing thereby being suitable to slide into the slots of the other, and vice versa. It will be obvious that in this manner the effective diameter of the pulley can be altered at will; when the two wings or plates of the pulley are separated as far as the speed lever permits, the driving chain-belt will run at the bottom of the V-shaped groove, and will effectively be running on a pulley of small diameter. When the operating lever

closes the two wings as closely as they are designed to go, the alternate slots and webs will intermesh and the V-shaped groove will be formed much nearer the top of the wings; in this position the chain will be running on a pulley of large diameter. The two pulleys are controlled by the lever M, and are so arranged that as one is contracted in diameter the other is expanded, enabling any ratio between one to eight and one to two to be obtained, the speeds not being restricted to three or four, as in the usual type of change-speed gear. A reverse motion to the driving shaft A is obtained by the introduction of a planetary or epicyclic gear at D. It is claimed that the pulleys can be expanded without any effort on the part of the operator, even when driving a heavy load, and that the system gives a smooth, noiseless drive.

Continental Tyres.

The CONTINENTAL TYRE AND RUBBER COMPANY has had a good season and contemplates an equally successful one for next year. For the coming season the Continental tyre and non-skid has a square washer under the rivet, a good innovation. The Red Rubber steel armoured non-skids continue to maintain their reputation. These are made with a grey rubber tread and red rubber sides—a combination of exceptional strength. Reference to the "Continental" Vinet detachable rim will be made on a later occasion.

New Motor Tyres.

Messrs. GEORGE SPENCER MOULTON AND CO., LTD., made their debut as exhibitors at automobile exhibitions, and took the opportunity of introducing a new motor tyre they are bringing out for the 1908 season. Agents are now being appointed, the arrangements in connection with which could be obtained from the stand in the Gallery, or from their office at 77, Cannon Street, London, E.C. The firm are not newcomers in the rubber business, having been established in Wiltshire for many years, and having supplied rubber goods to many of the important railways. Here they had a selection of rubber mats, &c., for motor-cars. The special feature of their new motor tyre is the groove larger at each side than at the centre, which throws out the dirt, and so maintains the efficiency of the device. The firm have also a stud led tyre of good design, and at their works at Bradford-on-Avon undertake all classes of tyre repairs. They are usually able to do retreading work in about seven days, but rightly advise motorists to allow the repair to remain three weeks before being used—a wise precaution that should be generally followed.

Peter Union Tyres.

The productions of the PETER UNION TYRE COMPANY'S works were to be seen in the Gallery, and also at the London depot of the concern, 6, Upper St. Martin's Lane, W.C. They include pneumatic tyres for touring and racing cars, as well as for motor-cycles: solid tyres for commercial motor vehicles, lorries, vans, and vehicles of that type; and the Peter Union puncture proof bands. These latter are made in an endless ring for service inside the tyre, being laid between the outer cover and inner tube, thus affording protection where most needed. In this way the resiliency of the tyre is in no way impaired, and full protection is given. The company's detachable rim has a detachable band brought together by a right and left hand threaded screw worked with a tommy bar.

Sawyer Non-skids.

The various specialities which have become favourably known to motorists under the name of the Sawyer specialities in connection with tyres were shown by the PADDINGTON MOTOR COMPANY, LTD., of 315, Euston Road, N.W. These comprised non-skid bands of the detachable and also the vulcanised type, the "Sawyer" combination non-skid, and also examples of what can be done in the way of repairs. The vulcanised non-skid band is a protective chrome leather studded outer cover placed over the outside of any worn or new pneumatic tyre. The band is light but possesses great strength and elasticity, enabling it to withstand any sudden strains. The "detachable" Sawyer band can be attached in a few minutes by deflating the tyre, inserting the clips under the wheel rim, and re-inflating. When the tyre is properly inflated, and the non-skid in position, it presents a neat and shapely appearance, cannot creep, and, while protecting the tyre from skidding and puncturing, cannot injure the tyre in any way. The combination tread has equally good merits of its own, and, despite the growth of rivals, the Sawyer specialities maintain their place.

Pumps and Radiator.

The ALBANY MANUFACTURING COMPANY, LTD., of Willesden, were early identified with improvements in motor-car components and accessories, and a visit to their stand was, this year, of interest owing to the presence of two pumps of good design and construction, securing a maximum of efficiency in operation. One was the Willesden Albany double helical patent positive pump. This has only two working parts, viz., double helical gear wheel gearing into a second helical wheel which is part of the driving shaft. This secures the advantages of a positive valve pump and is noiseless in action. In connection with the system of forced lubrication on cars the pump should be arranged on the circulating system to draw from an oil tank delivering into the sight feeds. These are adjusted in the usual way, and should be fitted with a relief valve and

adjusted to lift at about 30 lbs. to the square inch, returning the excess of oil to the tank. The pump can be run at practically any speed, but 100 to 200 revolutions per minute will be found adequate. Another type of pump shown by the company was the Lamplough-Albany positive pump. This has three working parts, viz., an eccentric which is part of the driving shaft, a circular piston and an oscillating valve cradle. In conjunction with the rocking cradle the piston acts as a suction and delivery valve, giving a positive as well as a noiseless operation. Albany honeycomb radiators, carburettors, and pumps were also included in the exhibit.

Van Raden's Specialities.

At the stand of Messrs. VAN RADEN AND CO. the visitor expected to find high grade electrical novelties, and he was not disappointed. A magneto for four-cylinder vehicles was exhibited which is extremely small and light. This was secured by dispensing with the distribution gear, a point which also simplifies the construction. The new magneto is comprised of eight sections only, held in position by two screws, and the whole can be taken apart in half a minute. It can be used either left or right and is driven at the speed of the crank-shaft. The firm also showed accumulators of spun and woven glass type, in new pattern unbreakable, celluloid, ebonite and glass boxes. One of these accumulators has been in use for seven years and is still doing good work. They also exhibited a wide range of single and multi-cylinder trembler, and distributor coils, as well as plugs, voltmeters, amperemeters lighting batteries and other specialities. Models demonstrating the construction of the Van Raden woven glass accumulators were also on the stand.

The Gillett-Lehmann Carburettor.

Among the many excellent exhibits to be found on the stand of the UNITED MOTOR INDUSTRIES, LTD., was the Gillett-Lehmann carburettor, introducing a novel system of control and securing economy and flexibility in operation. The adjustable float is of a special shape, giving great sensitiveness, and the level of the petrol is adjusted by a mere turn of a thread. The throttle lever acts so that a start can be made without the "tickling" that is often necessary. There is an extremely accessible jet which is removed by unlocking one milled nut only, and altogether the system is well calculated to interest practical motorists. Reference to other Gillett-Lehmann specialities will be made in a later issue.

Lathes.

In the Gallery, where accessories and tyres were mostly found, were to be seen the well-known machine tool makers, Messrs. DRUMMOND BROS., LTD., of Ryde's Hill, near Guildford. The firm showed several types of their tools, which have lately come well to the notice not only of makers of cars, but also of those who undertake the repair of the same. The lathes exhibited have 3½ in. and 5 in. centres respectively. The latter tool is of great capacity and power and is fully capable of taking a deep cut in rough hard cast iron with the scale on, on pieces 14 in. in diameter by treadle. The 3½ in. lathe is a useful appliance supplied with the following accessories, viz.—face-plate and driver chuck, travelling back-stay, hand-rest, coned centres, driving belt and spanners. The whole design of the lathe is much more rigid than the ordinary pattern appliance. It is speeded highly for small work and wood turning and has low speed also for large work. The workmanship of all the lathes of Messrs. Drummond Bros., Ltd., is of a high grade character.

Mr. ROWLAND HILL, of the Albion Foundry, Coventry, was represented by a selection of aluminium, gunmetal and bronze castings. Various examples of motor cylinders were also shown.

"Nickel steel" frames for motor-cars and a selection of "nickel steel" cross members were exhibited by Mr. JOHN THOMPSON, of the Etingshall Boiler Works, Wolverhampton.

In the "B and B" carburettors for the 1908 season Messrs. BROWN AND BARLOW, Ltd., have made a successful endeavour in the direction of accessibility while in no way sacrificing the efficiency. The various parts of the device can now be easily dismantled and readjusted.

At the stand of Messrs. WILLANS AND ROBINSON, LTD., were some excellent specimens of their cylinder, piston, and piston ring castings, as well as "Vanadium" steel crank-shafts, etc. Here, too, was the Wirtz gear, to which we shall make further reference in a later issue.

At the stand of the MOTOR SUPPLY COMPANY, LTD., was a collection of accessories, including the Willocq-Bottin headlight and automatic generators. These "glareless lamps" have a good projecting power and yet overcome the disadvantages of the searching glare often experienced with motor lamps.

Every variety of device used in connection with lubrication was comprised in the exhibition of Messrs. ROTHERHAM AND SONS, of Coventry, whose petrol filters and sight-feed lubricators have many points of advantage. Many new patterns in taps, &c., were on view, and the collection was of general interest.

A complete range of ignition and accumulators was shown by Messrs. J. C. FULLER AND SON, of Wick Lane, Bow, E., as well as self-starting magnetos and high-tension magnetos. Here, too, were found the firm's Syntonic high speed coils, which are tested up to 3,000 revolutions per minute, and special coils for synchronised ignition.

(To be concluded.)

THE STANLEY SHOW.

ON Friday, the 22nd, the thirty-first annual show of the Stanley Club opened at the Royal Agricultural Hall, London, N., and will continue until 10 p.m. on the evening of Saturday, the 30th inst. It is well up to anticipations, the number of exhibitors being practically as last year, while special interest attaches to the display of motor-cycles and motor accessories. Below we refer to some of the main features likely to prove of most interest to our readers:—

The "Royal Starling" and "Imperial Starling" Cars.

The STAR CYCLE COMPANY, LTD., Wolverhampton, have for some years been devoting attention to the construction of cars suitable for motorists of modern means, and in the "Royal Starling" have a vehicle which has already won many friends on account of its sound construction and reliability, as well as its relatively low price. The design follows the usual lines of live axle vehicles; the engine, which is rated at 10-h.p., comprises two cylinders $3\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke. The transmission is through a leather-faced cone clutch, a three-speed gear-box and cardan shaft to the back axle, which is of ample proportions. All the details of the car are on modern lines, as an indication of which it may be mentioned that both the gear-box and back axle are mounted on ball bearings. The vehicle can be supplied with either a two or four seated body, examples of both of which are on view. One is also shown in a form rendering it extremely useful for commercial travellers, a sample chest taking the place of the usual rear seats. The Imperial Starling is the latest production of the company; it is, generally speaking, on similar lines to the Royal, the engine is an 8-h.p. single cylinder, while the three speed gear-box is gate-controlled. Constructed with the view of providing a reliable car at a small cost, the vehicle is one which should have a large number of purchasers.

The Opel Cars.

A new series of German-built petrol cars known as the Opel makes its debut in this country under the auspices of the British Electromobile Company, Ltd., of Halkin Street, London, S.W. Three sizes are on view, 14-20-h.p., 18-30-h.p., and 25-40-h.p.—all fitted with four-cylinder engines, and while the general arrangement is that of standard live-axle cars, the details comprise many points of interest. The cylinders are cast in pairs, and while in the 14-20-h.p. the valves are all on one side in the larger models they are operated by separate cam shafts. Two systems of ignition are provided—low tension magneto and coil and accumulators. A governor acting on the throttle is installed to prevent the engine racing; a foot accelerator is, however, available for cutting the governor out of action when desired. The honeycomb radiator is provided with a large fan, the spindle of which is supported on springs in order to keep the driving belt at the right tension. The oiling of the engine is effected by a dredger type of lubricator mounted on the dashboard. The clutch is of a cone type, leather-faced in the case of the 14-20-h.p. car, metal-to-metal in the others, the shaft connecting it with the gear-box being provided with a universal joint to allow for any want of alignment between the two parts. Four forward speeds are available in

Fig. 1.—The Opel 25-40-h.p. Engine.

addition to the reverse, these being "gate"-controlled. The cardan shaft has universal joints at each end, while the live axle is enclosed in a casing, which carries the weight of the vehicle. Ball bearings are used to all parts except the engine, while the wheel base of the chassis is such as to allow of any type of closed or open side-entrance body to be fitted. Altogether the Opel cars make a very favourable impression. Two of the B.E.C. electrical vehicles are also to be seen at this stand, one in chassis form, the other finished as an exceedingly comfortable landaulet.

The Sabella Car.

A new two-seated car known as the Sabella is shown by the SABELLA MOTOR CAR COMPANY, LTD., of Camden Town, N.W. The arrange-

ment follows the usual lines of live axle vehicles, the motive power being supplied by a 10-h.p. two-cylinder engine having accumulator ignition and thermo syphon cooling. The cam shaft is so arranged that it can be readily withdrawn. The clutch is of the multiple disc type, and the gear-box gives three forward speeds in addition to the reverse.

The Aries Car.

An interesting display is made of the latest models of Aries cars, which are now being handled in this country by a new concern known as ARIES MOTORS, of which Mr. R. Lee Philpot is the manager. The 16-h.p., which is shown both in chassis form and complete with a roomy side-entrance double phaeton body, is a new model, in which there are several departures from the practice hitherto followed in Aries vehicles.

Fig. 2.—Sectional View of the Rear Axle on the Aries 16-h.p. Car.

In the first place, the four cylinders are all in one casting with the valves operated off a single cam shaft. The bore is 84 mm. and the shaft 110 mm. The ignition is by Simms-Bosch high-tension magneto, and a feature of the automatic carburettor is that all the engine cooling water passes through its jacket. The engine lubrication is effected by a pump which draws the oil from a sump or well in the base chamber. The transmission is through a leather faced cone clutch and three-speed gear, giving a direct drive on top to the cardan shaft, which is connected with the rear live axle through bevel gearing. Fig. 2 gives a sectional view of the new back axle, which is so arranged as to allow the road wheels to be splayed slightly out of the perpendicular, this feature being rendered possible by the introduction of the special joints d.d. The other cars on view include a 20-25-h.p. limousine landaulet and a 30-35-h.p. polished chassis. The 20-25-h.p. model has separately cast cylinders 105 mm. stroke, while the dimensions of the 30-35-h.p. are 120 mm. by 140 mm. The most powerful car is equipped with a special carburettor, in which the speed of the motor is automatically controlled by the varying pressure of the circulation water acting on a special form of throttle. In both the 20-25-h.p. and 30-35-h.p. cars the clutch is of the metal disc pattern, while the back axle is of a special type that has been previously illustrated in these columns. The weight of the car and the differential case is carried by a curved fixed axle forged in one piece, the ends being shaped to form journals for the rear wheels and bored out to allow the live shafts to pass through. The latter are provided with a flexible coupling, which enables the road wheels to be splayed so that the bearings are immediately over the point of wheel contact with the ground. We may add that ball bearings are used to all parts of the Aries cars except the engine.

The Chater Lea Carrette.

A novel two-seated car, built on motor-cycle lines, is displayed on the stand of Messrs. CHATER LEA, LTD., Golden Lane, London, E.C. The motive power is supplied by a Sarolea 6 h.p. two-cylinder V-shaped engine located on the outside of the right member of the frame. The motor, which is air cooled, is furnished with a Longuemare carburettor and a high-tension magneto. The power is transmitted to the off side rear wheel through the Chater Lea variable speed pulley and a chain belt, enabling speeds up to thirty miles per hour to be attained. The variable speed pulley is made with one fixed flange; a system of cams varies the position of a sliding flange, and so alters the effective diameter of the pulley. The latter is mounted on a countershaft, chain driven from the engine, which is mounted on a lever pivoted on a centre corresponding with the centre of the engine shaft. By a movement of the lever the countershaft can be partly revolved round the engine shaft, forward or backward, varying the distance between the pulley carried on it and that on the road wheel. This alters the tension of the belt, which, when slack, permits the engine to run without driving the road wheel and allows the vehicle to be driven in traffic in the same way as with a clutch. A separate rod with an operating handle sliding upon the lever controls the variations of the speed ratios, which can be varied from $4\frac{1}{2}$ to 1 to 7 to 1 or in like proportion. The steering is controlled by an inclined wheel and the cycle type road wheels are shod with 28 in. by $2\frac{1}{2}$ in. tyres. The little vehicle has been introduced to meet the demands of those motorists who have hitherto been content with motor-bicycles or tri-cars for something "just a little better" than any of these, and may be regarded as the stepping stone from a motor-cycle to a car.

AUTO CARRIERS, LTD., of Norwood Road, S.E. exhibit one of their light three-wheel delivery vehicles, and a similar machine arranged with a seat for an additional passenger in place of the goods chest. As an illustrated description of the interesting three-wheeler has been given in the *M.C.J.* it need only be mentioned that it is fitted with a 5-6-h.p. air-cooled engine having two fly-wheels. The transmission is by a single chain wheel to the rear road wheel, a two-speed gear being contained in the hub of the latter. The AUTOMOBILES DE LUXE, LTD., display a number of Darracq cars ranging from 12-h.p. to 40-h.p. which they keep on hand for hiring-out purposes, a branch of business in which they have met with considerable success. The N.S.U. CYCLE AND MOTOR CO. have on view a new 12-h.p. car fitted with side-entrance double phaeton body. The engine comprises four cylinders, 70 mm. bore and 100 mm. stroke, while the transmission is through a three-speed gear-box and bevel gear to a live axle.

A feature of the Exhibition is the large number of motor-bicycles on view; among the novelties in this section are the Max, in which no seat is provided, the rider assuming a standing position on footplates which are within a few inches of the ground.

The "Sentinel" accumulators are shown by the BOWEN AND ODERY MANUFACTURING COMPANY, of Pomery Street, New Cross, S.E. The plates of these are cast in pig lead hardened by the admixture of antimony and pasted with a special composition unusually hard and porous. The Sentinel ignition accumulators are fitted with the firm's non-corrosive terminals, which effectively prevent the creeping of the acid. Trembler coils and a variety of electrical accessories make up an interesting display.

Mr. R. W. COAN is again in his familiar corner at the entrance to the hall with illustrations of how effectively he can repair cracked aluminium castings. This is a department he has made his own, and he has done work for all the leaders of the motor trade.

The COUNTY CHEMICAL CO., LTD., of Excelsior Works, Birmingham, have come well to the front with their vulcanisers. Their Hay electric device, recently introduced, has already been adopted by many motorists, including Lord Powerscourt and Sir Henry Norman, M.P. The requisite temperature is obtained in ten minutes from a 4 volt accumulator. The vulcaniser consists of a wooden block having a curved metal plate on one side and a flat metal plate on the other. Beneath the plates are a collection of wires heated by the current. All that the operator has to do is to connect up the wires to the accumulator, and in twenty-five minutes the patch will be found thoroughly vulcanized. Other vulcanisers of the company are a combination air tube and cover vulcaniser—a capital all-round workshop apparatus, a jointing up vulcaniser and a special air tube vulcaniser. In addition to these specialities, mention may be made of the Chemico carbide, G.B. motor oils, and a full range of vulcanising materials.

In the tyre section of the Show will be found "Le Persan" motor tyres. These are on the stand of the INDIA RUBBER, GUTTA PERCHA AND TELEGRAPH WORKS CO., LTD., of Silvertown, Essex, and although made, as are the majority of motor tyres, out of rubber and canvas, are so constructed as to secure unusual resiliency and durability. The beading is practically unstretchable, so that it has no tendency to become limp and stretch, even when the tyre is well worn. The materials employed in the manufacture of "Le Persan" tyres are so compressed that the covers are thoroughly homogeneous and have great strength. Reference may also be made to the firm's metal-studded non-skid motor tyre, the studs in which are fitted by a special process and will not pull out, so that the tyre retains its good qualities of overcoming skidding right to the end of its life.

Mr. H. J. HARDING, of 211, Northumberland Park, Tottenham, N., will be found in the Arcade with a selection of motor accessories, prominent among which is the "Pushon" patent "Eclair" instantaneous pump connection for motor-cars, &c. This will fit any type of valve, and obviates the necessity for twisting swivel joints, so that the risk of leakage and other trouble is minimised. It consists of an air chamber which is connected by the usual rubber tubing to the pump. The rubber washer is provided with two turned lips, the inner one of which is pushed over the valve and the outer one lies against the side of the open end of the air chamber. Locking rings are provided to hold the washer in place, and there being no twisting the usual strain on the rubber tubing is entirely done away with.

The "Universal" piston ring remover is shown by SHARPE'S UNIVERSAL PATENTS COMPANY, of 720-722, Holloway Road, London, N. This is designed to overcome the troublesome business of removing rings from pistons. The points of the remover are inserted in the split of the ring, which is opened on the application of pressure to the handles of the device. It can then be easily and safely removed. Equally effective is the "Universal" valve spring lifter, which has a parallel movement securing the desired object without putting any strain upon the stem of the valve.

Messrs. T. H. LEWIS, LTD., of the Chalk Farm Coach and Motor Works, Gloucester Road, London, N.W., show their motor-car bodies fitted with wind screens and Cape cart hoods. These are of excellent design and finish, and the firm are evidently well able to undertake all classes of motor-car body work.

The Belmont non-skidding tyre protector, which is shown by the BELMONT TYRE PROTECTOR CO., LTD., of Linden Arcade, High Road, Chiswick, London, W., has points of advantage which should obtain for it the consideration of practical motorists. It is made of special fibrous material and constructed in such a way that it does not fray or stretch,

wearing evenly and well and never losing its gripping effect on the road. The attachment of the Belmont device to the wheel is extremely simple.

The ELEPHANT CHEMICAL COMPANY, of Camberwell, have a good assortment of their Calcoide, carbide oils and greases and similar specialities for motorists.

Demonstrations of the merits of their vulcanising process are being made by ARA, LTD., of 100, Long Acre, W.C., whose ingenious system has been previously explained in our pages. The principle upon which it is based is that of collecting together particles of raw rubber in a container, vulcanising them by immersion and welding them together. It is claimed by this method to produce a homogeneous material of high tensile strength.

The UNION RUBBER AND CHEMICAL COMPANY, LTD., Shaw Street, Ashton New Road, Manchester, show the new Turco electric vulcaniser for use in an ordinary four volt accumulator, and also the full range of Turco productions, such as carbide, tyre repair outfits, rubber solution, chain dressing, motor oils, and other preparations which have quickly gained the favour of practical motorists.

The Oleo plug is on the stand of Messrs. LEO RIPAULT AND CO., 64A, Poland St., W. This plug is well known both in France and in Great Britain, it having been adopted by many of the leading makers of cars. A reliable device, it forms but one of the attractions in an exhibit of considerable interest to motorists. Mention may also be made of the Oleo-Davidson puncture detector. This is based upon the pressure of the air in the inner tube, the device being fixed by a collar to the wheel spoke. The usual valve cap is dispensed with, the union piece of the puncture detector being screwed on to the valve instead. Then when the air pressure falls a handle is set loose to strike an arm connected with the electric bell on the dashboard in front of the driver, who is thus informed of the trouble.

The PRESTED MINERS' LAMP COMPANY, LTD., of 1, Elthorne Road, Holloway, N., show their complete sets of electric ignition for motor-cars.

Among other exhibits of interest to motorists are the "Exonite" specialities of Dover, Ltd.; the tool bags, &c., of Messrs. J. B. Brooks and Co., whose novelties we described in our report of the Olympia Show; the Taylor Quick-grip spanners; Mr. W. G. Nixey's graphite grease for gear-boxes, motor chains, &c., as well as the firm's other graphite specialities in connection with lubrication; a selection of motor accessories by Mr. M. Adler, of Coventry; the Autoloc patents for the control of the throttle, spark advance, &c., by the Autoloc Syndicate, Ltd., 3, The Mall, Church End, Finchley, N.; horn bulbs by the Leicester Rubber Company, of Granby Place, Leicester; motor clothing by the Express Trading Company; accumulators, lamps, voltmeters and the like by the City Importing Company, who have a selection of the Frankonia motor headlights; tyre pressure gauges, tool kits, &c., by Mr. E. H. Hill, of the Beta Works, Sheffield; the various ingenious devices brought out by Messrs. T. S. Nickells and Co., 2, Dornberg Road, Blackheath, such as the combined connector and tyre tester, telltale fittings for rear lamps, &c.; Brampton's chains; a good type of motor-car house shown by Mr. Randolph Meech, of the West of England Appliance Works, Poole, Dorset, which has the merit of economy in price as well as quality in construction; the Ajax detachable rim with its ingenious method of attachment and detachment; the well-known bifurcated and tubular rivets of the company of that name; the Cnez-lui enamels of Messrs. J. Price and Son; the specialities of the Bowden Brake Co.; the rubber goods in connection with the motor and kindred industries manufactured by Messrs. W. and A. Bates, Ltd., St. Mary's Mills, Leicester; the "Coventry chains and chain lubricant, introduced by the Coventry Company; the motor novelties of the South British Trading Company; the "Moebius" challenge motor oils, and also the "Challenge" motor grease of Messrs. Moebius and Co., of Howard Road, Stoke Newington, N.—preparations which have shown a remarkable consistency both in summer and winter; the washers of Fastnut, Ltd., which have gone well forward since their introduction at one of the Cordingley Motor Shows; Carroleum for leather-faced clutches and the motorist's soap, Manulav, prepared by the Price's Patent Candle Company, Ltd.; and the "Patchquick" motor patches of Messrs. Woodgate Bros., of Tiverton.

THE "Wapama" dust device for preventing the raising of dust by motor-cars is being introduced to motorists by Messrs. Wayman and Matthews, 1, Albemarle Street, Piccadilly, W. This was fitted to a 28-h.p. car and obtained distinction in the dust trials held on the Brooklands track during the summer—a fact just notified the inventors by the judges. Based upon the view that the spokes of the wheels are a great factor in raising dust, discs are provided for encasing these and thus preventing the raising of dust by the propelling action of the spokes. The discs are easily put on in twenty seconds and can be detached in even a shorter time. The "Wapama" device has certainly proved its value, and, although we are not troubled much with the dust nuisance at this season of the year, such inventions are well deserving of consideration at all times.

CASES UNDER THE MOTOR CAR ACT.

— DANGEROUS DRIVING. —

At the Eastbourne Borough Bench, on Friday of last week, William Chapman, of London, and Miss Florence May, New Cavendish Street, London, S.W., were summoned for driving a motor-car in Terminus Road and Grand Parade at a speed dangerous to the public. P.C. Cook stated that he saw the car travelling at about twenty-five miles an hour. Later John William Soddy also spoke to seeing the car in Terminus Road travelling at an excessive speed. He felt it his duty to complain to the last witness. His attention was called to the motor by the horn sounding, and it had to swerve in the road to avoid a pedestrian. There was no vehicular traffic at the time.

Mr. T. Kirtlan, who represented both defendants, contended that there was absolutely no evidence against Miss May, who gave no orders which would occasion a dangerous speed. Chapman said he was engaged on the understanding that in no case was he to exceed the speed limit. On this particular day the car broke down in the country, and afterwards Miss May had to complain about the slow speed. In Terminus Road the speed did not reach ten miles, and it was not increased on the Parade. After some consideration, the case against Miss May was dismissed, and Chapman was fined £5 and costs.

SPEED OF TAXIMETER CABS.

William Gibson, a taximeter cabman, living in South Norwood, has been fined by Mr. Marsham at Bow Street Police Court £5 for driving in a manner dangerous to the public. It was stated that the cab was travelling in the Strand at about ten miles an hour. A constable at the Charing Cross refuge put up his hand as a signal to the driver to stop. He did not stop, and Mr. W. Humphries, an elderly gentleman, was knocked down by the cab. Defendant said he did not see the constable raise his hand, and when he noticed Mr. Humphries he did all he could to avoid an accident. Mr. Marshall said he had no doubt that the constable held up his hand, and if Gibson had stopped at the time there would have been no accident. Elderly people must be protected.

NO REAR LIGHT.

Cases in which motorists have been convicted for driving without a rear light are reported from Harrogate, Eastbourne, and Leeds.

A DISMISSAL.

John Rhodes, Royal Engineers, East Liss, was summoned at the Guildford Borough Bench for having driven a motor-car at a speed exceeding ten miles an hour, in High Street, on November 7th. P.C. Hatcher estimated the speed at fifteen miles an hour. The street was full of traffic, and the car was shooting in and out at a very fast speed. Defendant said he knew about the limit, and thought the police must have been misled by the size of the car. Lord Torrington, owner of the car, agreed with defendant that the speed was not above ten miles an hour. There was very little traffic. The Bench decided that there was a doubt in the case, and they gave defendant the benefit of it.

FIRST CASE AT SOUTHWELL.

The first case under the Motor Car Act that has come before the Southwell magistrates has just been investigated, when William Birkett, chauffeur, of Southwell, was summoned for driving a motor-car at a speed dangerous to the public, on the lower road at Southwell, on November 6th. The defendant was fined £5 and costs.

EXCEEDING TEN-MILE SPEED LIMIT.

At the Kingston Borough Bench, John M. Bonstead, of Wimbledon Common, was summoned for driving a motor-car in Clarence Street on October 27th, at a speed exceeding ten miles an hour. P.C. Beck said he timed the car driven by the defendant, which was going towards the bridge, and it covered the measured furlong at a speed of about seventeen miles an hour. Defendant said he was not aware that he was driving within a ten-mile area, and he did not think he was going more than eight miles an hour. He asserted that he was waved on by the constable on duty at the bridge, and put on his accelerator in consequence, so that he was really drawn into the trap by the police. P.C. Davis, who took the time at the other end of the furlong, said the speed was over eighteen miles an hour. The magistrates decided to convict and called for the defendant's licence, which showed a previous conviction at Bow Street for exceeding the limit in one of the Royal parks. A fine of £3 and 15s. costs was imposed. Defendant asked where he could raise the question of the conduct of the police, as he did not think it was fair for the two constables who were timing the car to employ a third to lure a driver into a trap. The magistrates told the defendant if he was dissatisfied with the decision he could appeal.

EXCEEDING THE LEGAL LIMIT.

On Monday cases against four motorists for exceeding the legal limit were heard at the Shoreham Petty Sessions. Fines were inflicted in all cases.

PUBLIC MOTOR SERVICE.

A MOTOR-BUS service is being established at Stafford with a vehicle of 30-36 h.p. supplied by Commercial Cars, Ltd., of Luton. Councillor M. Mitchell is at the head of the enterprise.

COMPANY NEWS.

AJAX DETACHABLE RIM COMPANY.—£500. Coventry Works, Arthur Street, Small Heath, Birmingham.

AUTOMOBILE ASSOCIATION.—Limited by guarantee. Twenty members. Liability, £1. As title. Managed by administrative committee.

LONDON AND PORT TALBOT MOTOR COMPANY.—£10,000. As title. Agreements (1) with A. Haswell, and (2) with S. Broad. First directors: Captain O. Felton and Mr. D. Jones. Bank Chambers, Aberavon, South Wales.

IRISH MOTOR TYRE SYNDICATE, LTD.—Capital £500. To develop, test and exploit a specially-prepared leather tyre for motor-cars, &c., invented by Mr. Edmond Kerr, 8, Duke Street, Dublin.

UNIVERSAL MOTOR IMPORTS.—£2,500. To adopt an agreement with Mr. J. Barnham for acquisition of business formerly carried on at 1, Charles Place, Drummond Street, N.W., as Universal Motor Imports. No initial public issue. First directors: F. H. Jones and F. Canham.

HUMPHRIES ENGINEERING SYNDICATE.—£4,800. To adopt agreements (1) with Mr. F. Humphris for acquisition of certain patents and rights and (2) with Mr. E. G. Abrahams, for acquisition of his interest in certain patents. No initial public issue.

ELSWICK SIMPLEX AUTOCARS.—£12,500. Automobile builders and proprietors. Agreement with MM. P. Piellat and O. C. Selbach. No initial public issue. First directors: Messrs. O. C. Selbach (managing director), P. Piellat, J. T. C. Moore-Brabazon and W. J. Wright. 110, High Street, Marylebone, N.W.

J. AND R. OLDFIELD.—£5,000. To acquire business of lamp manufacturers carried on at Warwick Street, Birmingham, as J. and R. Oldfield, 47, Warwick Street, Birmingham.

ROADS CONSTRUCTION COMPANY.—£20,500. To construct roads for motor and cycle traffic. Agreement with Mr. J. H. Borrer and others.

Mr. A. W. Gamage at the Wheel of his 40-h.p. Six-Cylinder Napier.

SWIFT COMPANY.—Mr. Alfred Du Cros, presiding on Tuesday at the meeting of the Swift Cycle Company at Coventry, proposed the adoption of the report, showing nearly £40,000 profit on the year's trading. Their sales of motor-cars had exceeded by over 40 per cent. those at the same period of the previous year. Mr. C. Thomson seconded, and the report was unanimously adopted. A 6½ per cent. preference dividend, and the last six months' ordinary dividend at 25 per cent., making 20 per cent. for the year, were declared.

ARGYLL MOTORS, LTD.—The report for the year ending 30th September, 1907, has been issued. The motor account shows a gross profit of £30,360 as compared with £125,133 in the previous year, the lower prices accepted for cars entailing a diminution in the returns of £45,300. A large number of obsolete parts, &c., were discarded at a loss to the company estimated at £32,000. The plant and premises have been thoroughly maintained out of the revenue at a cost of £12,533. The result of this severe method of dealing with the accounts brings out a total loss of £15,213, from which the directors have deducted the sum of £3,230, being the balance from last year, and £4,000 from the general reserves, leaving the net sum of £7,982 at the debit of profit and loss account. The directors felt justified in paying the interim dividend in May last, as up to that time sales showed an increase of 30 per cent. over last year's returns. The further dividend due on the 6 per cent. preference shares and on the seven per cent. participating preference shares is to be deferred to May, 1908. The board will nominate at the forthcoming meeting Mr. Thomas Dence as a director, and he has agreed to take the largest interest in the company held by any individual. The directors are convinced that the company has a great and prosperous business before it in the future, and ask the shareholders to have patience for a short time. In a circular Mr. W. A. Smith, the chairman of the company, says that there is nothing in the judgment of the directors to justify the present low prices of the shares, and adds that he is consistently increasing his holding and now owns one-third more shares than he did at the inception of the company.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

ARRANGEMENTS are being made with the General Steam Navigation Company for the issue of passenger tickets by the Club for the company's London to Bordeaux service. It will also be possible to book the transport of cars through the Club to Bordeaux, and, as a number of cars are sent by this route during the winter, the arrangement should prove very useful. The G.S.N.C. quote special rates to the Club for the transport of these cars.

The offices of the touring department of the Club have been removed from 16, Down Street, to rooms in the Club's new motor house, 108, Piccadilly, with an entrance at 18, Brick Street.

THE MOTOR UNION.

At the meeting of the general committee of the Motor Union held last week, the notice from the Royal A.C. terminating the agreement between the club and the M.U. was taken into consideration. In the result an emergency committee has been formed consisting of the representatives of the affiliated clubs and the representatives of the individual members upon the general committee, with power to take such action as they may think desirable.

The members of this committee present met after the conclusion of the general committee, and appointed a sub-committee to go fully into the matter and to prepare a full report upon the position of the Union and the clubs included in its membership. This will be circulated in due course, and in the meantime the committee suggests that the clubs should

A Juvenile Motorist.

[Mr. A. Arthurton, Port Dinorwic.]

defer taking steps arising out of the action of the Royal A.C. until the situation is fully before them.

AUTOMOBILE ASSOCIATION.

AMONGST the 287 members elected at last week's committee meeting of the Automobile Association were the following:—The Marchioness of Donegall, Muriel, Countess de la Warr, Viscountess Chelsea, the Archbishop of Westminster, Viscount Brackley, Viscount Torrington, Lord Vernon, Sir W. J. Baird, Bart., Sir George Meyrick, Bart., Sir George Faudel-Phillips, and Messrs. Leopold, Anthony, Lionel, and Evelyn de Rothschild.

The election of these members marks an epoch in the history of the Automobile Association, inasmuch as with the election of Lord Vernon the membership reached 5,000, being a really remarkable increase of 3,000 in the preceding twelve months.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

A MEETING of the Council of this Institution was held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., on the 20th inst.

There were present:—Colonel R. E. Crompton (in the chair), Messrs. Dugald Clerk, Henry Lea, Victor Riley, Douglas Leechman, Chas. Marston, T. C. Pullinger, David J. Smith, F. C. A. Coventry, Douglas Mackenzie, T. B. Browne, Chas. Wheeler, L. A. Legros, C. R. Garrard, F. W. Lanchester, John S. Napier, and Alex. Craig.

The following were elected members of the Institution:—Messrs. Rowland Winn (Leeds), W. F. Rainforth (London), and C. Lorenzen (London). Messrs. W. Williams (Plymouth) and J. Butler (India) were elected associate members, and Dr. J. L. Lock (Uxbridge) was elected an associate of the Institution.

The question of admitting ladies as graduates of the Institution was further considered, and it was resolved that they could not be admitted.

A letter was read from Mr. B. H. Morgan offering to read a paper before the Institution on "Air Cooling for Petrol Motors."

A design for the seal of the Institution was submitted, and it was left in the hands of Dr. H. S. Hele-Shaw, Mr. Douglas Mackenzie, and the secretary.

The report of the representatives of the Institution at the Conference on Screw Threads of the Engineering Standards Committee, held on October 24th, 1907, was deferred until the next meeting, Mr. F. W. Lanchester promising to make a written report.

The following resolution was passed:—"That a unanimous vote of thanks be accorded to Mr. Rees Jeffreys for his zealous work in connection with the incorporation of the Institution."

At the opening meeting of the present session of the Automobile Engineers, held on Wednesday of last week, at Storey's Gate, S.W., Colonel R. E. Crompton, C.B., R.E., took as the subject of his presidential address the future of automobilism. The developments in road engineering which had recently taken place, mainly due to the demands of motor engineers, and which had led to a better knowledge of road construction, showed that roads can now be treated in such a manner that, when carrying moderate loads, probably not exceeding 500 lb. per inch of tyre width, or with tractive stresses not exceeding half this amount, they could, in the majority of cases, form a cheap and serviceable road, provided reasonable arrangements for cross drainage and for obtaining suitable gradients were made. It seemed quite reasonable to suppose that road engineers could design such light roads, having a metalled surface 12 ft. wide, of ample strength, with light bridges to carry axle weights not exceeding four tons, with ferries for taking the motor tractors and their trailers across large rivers, for a cost not exceeding £2,000 a mile. The speaker then referred to the strong objections railway engineers had to four-wheeled locomotives, owing to their hammering action on the metals, and suggested the adoption of the same system in motor-wagons. He had found, in fact, in the case of the Renard train in France, that the six-wheeled wagons, carrying six tons and travelling at ten miles an hour on steel-tyred wheels 3 ft. in diameter, ran very much smoother than those with four wheels of the same size, though only moving at about six miles per hour. In addition, too, the damage was very much reduced when the extra pair of wheels was used. A further advantage of the Renard train was that, as the power was transmitted through a flexible shaft to each vehicle, the driving stress was small, since it was divided among the whole number, and, therefore, slipping in wet weather was avoided.

THE MOTOR CLUB.

THE house-dinner given at the Motor Club on Wednesday of last week, in celebration of the Olympia Show as well as the entertainment organised and provided by Messrs. Harvey du Cros, jun., and Charles Jarrott, was a huge success. Every seat in all three dining-rooms had been secured several days previously, and the theatre was packed.

THE AUTO CYCLE CLUB.

THIS year the club has decided to make arrangements for a dinner and entertainment to be given to the road-menders on the Ripley road, and for this purpose has opened a subscription list. The first paper of the season will be "Variable Gears," by Mr. J. Van Hooydonk, on Thursday, December 19th.

These few weeks promise to be busy in social events. On November 27th the Southend and District Motor Club have a social gathering at the Hotel Victoria, Southend; Tuesday, December 3rd, the Motor Cycling Club have a smoking concert at the Tudor Hotel, Oxford Street, W.; and on the following Saturday, December 7th, the Essex Motor Club have their annual dinner and presentation of prizes at the Great Eastern Hotel, Liverpool Street, E.C. The Lincolnshire Motor Cycle Club have their annual meeting, smoking concert, and presentation of prizes on Wednesday, December 11th, on which night the Southend and District Motor Club also hold their first annual dinner, and on the following Saturday, December 14th, the Motor Cycling Club meet at the Trocadero Restaurant for their annual dinner, and the Walthamstow Motor Club at the Manchester Hotel, Aldersgate Street, E.C., for their annual dinner and Bohemian concert.

ON Saturday a meeting of the Auto Cycle Club was held at the Stanley Show, with Mr. Robert Todd in the chair.

A long discussion took place, mainly on the change of name to the Auto Cycle Union, and this was declared carried. It was also agreed to drop the social programme, to form local centres, and to take up the question of legislation affecting motor-cyclist.

ESSEX MOTOR CLUB.

THE Essex Motor Club have held a paper-chase at Woodford, the course being from the Castle Hotel, Woodford, to the Wake Arms, on the Epping Road; and although by a direct route these houses are only six miles apart, the hares made a detour covering twenty miles. The "hares" were Messrs. T. W. Applebee and H. Fuller, and there were twenty "hounds."

The "hares" carried bags of paper shavings for "laying the trail," and an extra bag of coloured paper squares for denoting false trails. One "hare," leaving his companion, would make a half-mile dash along a bye-road, industriously strewing the white shavings, then he would stop, deposit a liberal sprinkling of coloured squares, and ride back to rejoin his confederate. When the "hounds," half-an-hour afterwards, encountered this divided track, some rode one way and some the other. Those who rode on till they found the coloured squares realised that they had been "had," and, of course, raced back to the other trail, along which the luckier party of "hounds" had already made good headway. The winner was Mr. W. Pershke.

NOTTINGHAMSHIRE.

At a committee meeting of the Nottingham Club the following resolution was adopted:—"That notice be given to determine the agreement dated 12th December, 1906, and made between this Club and the Automobile Club of Great Britain and Ireland, now the Royal Automobile Club and the Motor Union of Great Britain and Ireland."

Many who are interested in the development of motoring in Nottinghamshire hope that it may be possible for the Union to be able to make such terms with the Royal A.C. that there may be still one organisation supreme in the motor world.

YORKSHIRE AUTOMOBILE.

THE Yorkshire A.C. will open their winter programme by holding a smoking concert at Bradford. Arrangements are also being made for lectures at the headquarters of the club, the Hotel Metropole, King Street, Leeds.

BROOKLANDS.

IN consequence of requests having been addressed to the Brooklands A.R.C. for facilities for the establishment of records in their respective standard classes, the committee of the club have decided to countenance only the following performances in connection with record claims in their standard classes (subject to Nos. 77 to 81 of the open competition rules of the R.A.C.):—

1. The 26-h.p. Standard Class Short Record, over half a mile, with flying start.
2. The 26-h.p. Standard Class Long Record, over ten laps, with standing start.
3. The 40-h.p. Standard Class Short Record, over half a mile, with flying start.
4. The 40-h.p. Standard Class Long Record, over ten laps, with standing start.
5. The 60-h.p. Standard Class Short Record, over half a mile, with flying start.
6. The 60-h.p. Standard Class Long Record, over ten laps, with standing start.
7. The 90-h.p. Standard Class Short Record, over half a mile, with flying start.
8. The 90-h.p. Standard Class Short Record, over ten laps, with standing start.

WELSH.

RECENTLY eighty-five motorists attended a dinner of the Welsh A.C. held at the Hotel Metropole, Swansea. Mr. Basil W. Valentin (president), of Llanelly, presided, being supported by four guests in Mr. Cory Yeo (the past president) and Captain D. Hughes-Morgan, who have presented handsome trophies for competition; Mr. H. Morton Evans, who was conspicuous for his hospitality in connection with the recent hill-climbing competition, and Mr. S. L. Gregor, to whom, as a former secretary, is due much of the success of the club. After the loyal toasts, in proposing the toast of the evening—"Our Guests"—the chairman spoke in eulogistic terms of them. Mr. Cory Yeo's generosity and love of the sport was mentioned; of Captain D. Hughes-Morgan the chairman referred to his motoring prowess; Mr. Morton Evans he alluded to as one of the earliest pioneers of motoring in the district, and with respect to Mr. S. L. Gregor, Mr. Valentin remarked upon the very able manner he had piloted the Welsh Club to its present state of high efficiency.

Each of the gentlemen replied. Mr. Cory Yeo's only regret was that Mr. T. W. R. Mason (Swansea), the winner of his cup, was not present. Captain D. Hughes-Morgan presented his cup to Mr. Hubert Thomas (Llanelly), and prior to doing so said he wished pressure could be brought to bear upon drivers of vehicles in front to give some sign that they heard motor-horns. Mr. H. Morton Evans suitably replied, and Mr. S. L. Gregor spoke of the support he had received from members of each committee. In conclusion he proposed the health of Mr. Shimmell Andrews, who, he said, was going to do the club a great deal of good.

Mr. Andrews, whose health was drunk with musical honours, replied saying that since February last the membership of the club had increased by thirty-seven.

Other toasts were "The Motor Union," proposed by Mr. F. Cory Yeo and responded to by Mr. Rees Jeffreys; "The Welsh A.C.," proposed by Mr. J. Thompson Willows and replied to by Mr. Jones; and "The Visitors," on whose behalf Colonel Morgan and Mr. J. Viner Leeder tendered acknowledgments.

AUSTRALIA.

A FIFTY-SIX miles petrol test was held on Saturday, October 19th, from Parramatta (near Sydney) to Medlow Baths, in the Blue Mountains. Although there were several good hills to be taken, Mr. J. Mailard (the winner) did the journey on 1 gallon 5½ pints of petrol, his car being a 12-14-h.p. Unic.

There is a decided increase in the numbers of motor-boats, launchers, cruisers, &c., this season both in Sydney and Melbourne, some of the new boats just going into commission being very fast. Henley-on-Yarra (Melbourne) regatta was held on October 26th, but the programme did not include any motor event, though several were being utilised by the officials.

The Automobile Club of Victoria are arranging a three-days' reliability trial for the end of November, possibly in the Western district, where the roads are good and the traffic light.

MR. T. H. RYLAND having resigned the hon. secretaryship of the Midland A.C., which has headquarters at the Grand Hotel, Birmingham, Mr. Frank H. Cerrito has been appointed as his successor.

A CHAUFFEUR IMPRISONED.

MR. JUSTICE GRANTHAM, at the Kent Assizes, has heard an indictment against Henry Copsey, aged 21, a chauffeur, of Islington, for the manslaughter at Bromley of Edward Akers, a cyclist. Witnesses for the prosecution spoke of seeing the prisoner driving his car at thirty or thirty-five miles an hour, and running into the deceased, who sustained a fracture of the skull, from which he died almost immediately. The jury returned a verdict of "Guilty," the foreman adding: "We

Captain W. E. D. Owen, a prominent competitor at Brooklands, at the wheel of a 54-h.p. O.T.A.V. Voiturette.

strongly recommend the prisoner to mercy on account of his youth, and because we think there was some negligence on the part of the deceased." His lordship said he would give effect to the first part of the jury's recommendation, but not to the second part, because he found that the prisoner had already been convicted four times of furious driving. Motor-car drivers, added his lordship, must not think that everyone ought to get out of their way, and if they caused the death of a fellow-creature by their carelessness, it was necessary that an example should be made. His lordship then sentenced prisoner to six months' imprisonment.

POLICE TRAPS.

POLICE traps are in operation on the Chichester road, Arundel, the Upper Worthing road, Angmering, and also in the parish of Poling.

THE police have lately been watchful of motorists between Whinney Moor Lane and the Nag's Head, on the Louth road, Retford.

SEVERAL traps in the vicinity of Edinburgh have been notified us, including those on the Berwick, Peebles, Penicuik and Linlithgow roads.

THE trap in the Eltham road, Eltham, is again in frequent operation.

SERGEANT MARKS has been again operating against motorists on the road at Esher.

THE Morden Road, Merton, is the latest suburban thoroughfare to have its police trap.

A TRAP has been established and is in almost daily operation at Rogate, near Midhurst.

THE control on the Great North Road, near Grantham, is again being worked by the police.

BETWEEN the Kingston Lane and the Windmill Inn at Southwick, and on the lower road from Lancing to Shoreham are police traps leading to the Petty Sessions at the latter place.

FORTHCOMING EVENTS.

—◆—
NOVEMBER.

30th (S.).—Annual Dinner of the North London A.C. at the Midland Grand Hotel, London.
Stanley Show closes.

DECEMBER.

1st (S.).—Last day of the Paris Motor Show.
2nd (M.).—Cheshire A.C. annual dinner.
5th (Th.).—Exhibition at Berlin.
Annual Dinner of the Southern Motor Club at the Trocadero, London; Ald. G. Howlett presiding.
7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
Annual dinner of the Hertfordshire C.A.C.
11th (W.).—Southend and District M.C. annual dinner.
Mr. Dugald Clerk at the Institution of Automobile Engineers, on—"The principles of carburetting as determined by exhaust gas analysis."
12th (Th.).—Annual Dinner of the Sheffield A.C.
18th (W.).—General Committee of the Motor Union.
The Tenth Annual Dinner of the Founder Members of the Royal A.C. will be held at the club-house.
21st (S.).—Opening of the Brussels Exhibition.
26th (Th.).—Annual Reliability Trial of the Motor Union of Western India.

JANUARY, 1908.

4th-11th.—Dublin Motor Show.
9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.
17th (F.).—Annual Dinner of the Nottinghamshire A.C. at the Victoria Station Hotel, Nottingham.

FEBRUARY.

7th-15th.—Manchester Motor Show at Belle Vue.
12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
15th (Sat.).—Auto-Cycle Club Annual Dinner.

AUTOMOBILE ACCIDENTS.

ON Saturday a boy aged about nine years was run over by a motor-car belonging to Mr. Watson Smyth, of Wadhurst Castle, Sussex. The chauffeur was taking the car to meet a passenger by the train at Wadhurst station. As he was descending the hill with the brakes on he is said to have noticed two lads in the road, and to have shouted to them. Both boys started towards the right, but one apparently changed his mind, and darted across the road in front of the car. The chauffeur quickly pulled up, but was unable to avert the boy being knocked down. A doctor was sent for, when it appeared that death must have been instantaneous, for the lad's neck was broken.

A RINGMER man, Harry Baker, of Mill Plane, was the victim of an unfortunate accident on the Cliffe Bridge at Lewes on Sunday. He was cycling between two motor-cars, one being in front of him and the other immediately following. On the bridge it seems he made a movement as though he were about to turn back. The rear car, belonging to Dr. A. E. Newington, of Ticehurst, unable to pull up so shortly, caught the cycle and threw the man under the front wheel. His shoulder was badly bruised, and the bicycle considerably damaged.

MR. LLOYD-GEORGE was motoring from Manchester to London, on Sunday, and when on a rough piece of road between Stafford and Lichfield the car jolted over an obstacle, and the President of the Board of Trade was thrown against the wind-screen on the front of the car. His head struck the guard and the glass cut his left eye. On reaching Lichfield a doctor put several stitches in the eyelid, and after being bandaged he was able to proceed to London.

AT Heatherside, between Camberley and Bagshot, on Sunday evening about dusk, Sir Henry Colville, K.C.M.G., was returning on a motor-cycle along Heatherside Road to his home near by. At the corner where the road joins the Maultway which leads from Blackdown Deepcut barracks to Bagshot, he collided with a motor-car driven by Brigadier-General Sir Henry Rawlinson, who was turning into Heatherside Road from the direction of the barracks to go to Camberley. The motor-cycle struck the car on the off front corner, and Sir Henry Colville was thrown with great violence over the bonnet of the car, on to the side of the road. Sir Henry Rawlinson stopped his car as quickly as possible, and ran to where Sir Henry Colville was lying. It was at once

seen that Sir Henry, who had pitched on his head, was terribly injured, and Brigadier-General Rawlinson communicated with the Brompton Hospital Sanatorium, while a telephonic communication was sent to Camberley for the St. John Ambulance van and for Dr. W. L. Stuart, of Camberley, who proceeded at once to the spot on his motor. The injured general was removed to the Sanatorium, where he was found to be suffering from a severe fracture of the base of the skull. The injured general did not regain consciousness and died after a few hours. The corner where the collision took place is a dangerous one, for it is not possible for persons coming either way to see round the bend for more than a yard. It is evident from the spot where the collision occurred that neither Sir Henry Rawlinson nor Sir Henry Colville saw each other until it was too late to avoid an accident.

AT the coroner's inquest on Tuesday at Frimley, Brigadier-General Lloyd, describing how Sir Henry Colville left him shortly before the accident, said that he went quite thirty miles an hour down the hill. Sir Henry had spoken about his fast travelling, saying that he frequently motored over to Windsor in about twenty minutes. Sergeant Meers said that he had known Sir Henry Rawlinson as a motorist for about three years, and he was a very careful and considerate driver. The coroner, in summing up, said there was no doubt that Sir Henry Rawlinson was driving very carefully round the corner. From the fact that the motor-bicycle struck the car on the off-side, and from the measurements which had been made, no blame could be attached to Sir Henry Rawlinson. The foreman of the jury said that they returned a verdict of "Death from fracture of the skull caused by an accident." They wished entirely to exonerate Sir Henry Rawlinson from all blame, feeling that he had taken every precaution, and was a careful driver, and that it was an absolute impossibility for the accident to have been prevented. They also desired to ask the owner of the hedge to have it removed, or so cut down as to prevent any accidents there in the future.

A LAMPLIGHTER was fatally injured by being knocked down by a motor-car in the High Road, Gunnersbury, and on Tuesday the driver of the vehicle was sent for trial from the Acton Police Court, bail being allowed.

AN INLAND REVENUE CASE.

FREDK. DAVIS has been summoned at the Guildford County Bench for keeping a motor-car without taking out a licence for same. Robt. Waldron, Inland Revenue officer, said that on August 20th he saw defendant driving a motor-car in Haslemere High Street. Witness sent him a form of declaration, and marked the duty for motor-cars. Witness waited for three weeks, but no licence was taken out, and he then went to see defendant. The latter said he had only taken people on trial runs, and was trying to sell the car. Witness explained that that did not exempt him. Mr. Turner said defendant had only once used the car, to take it to a prospective purchaser. He was trying to get rid of it, as trade was bad. Thinking that was not "using" it, he refused to pay for the licence. However, he now pleaded guilty to a technical offence.—Fined 20s., with 8s. 6d. costs.

BUSINESS NEWS.

THE Ole 'plugs marketed in this country by Messrs. Leo Ripault and Co. will be made in England ere long.

THE "Pegasus" detachable non-skid and motor tyre protector was shown at Olympia on the stand of Messrs. A. W. Gamage.

WE learn Mr. J. Spyker has resigned his position as managing director of the Industriële Maatschappij Trompenburg, Amsterdam, the manufacturers of the well-known Spyker cars.

THE BRITISH PETROLEUM CO., LTD., have issued about a dozen different designs of picture postcards of motoring subjects.

WE learn that Mr. R. Lee Philpot has been appointed managing director of West, Ltd., and will in future be responsible for the conduct of that company's business. This does not in any way interfere with the arrangement already made regarding Aries Motors, Ltd., both undertakings being under his management as separate concerns.

MESSRS. BROWN BROTHERS, LTD., had the honour of supplying a "Gabriel" horn to the King of Spain.

MESSRS. E. G. HERBERT, LTD., of Rosamond Street, East Manchester, have sent out a catalogue of their metal sawing machines and machine tool accessories which will be of considerable service to all engaged in the motor-car industry.

THE number of Dunlops fitted to cars exhibited in the Paris Salon this year is more than double that in the 1907 Show, an indication of the ever-increasing progress of Dunlops in the esteem of French motorists.

FROM Fiat Motors, Ltd., comes a copy of their new catalogue of Fiat cars. The models illustrated and described are six in number, viz., 15-20-h.p., 20-25-h.p., 28-35-h.p., and 35-40-h.p. four-cylinder, and 45-h.p. and 70-h.p. six-cylinder.

FROM the London and Parisian Motor Company comes an interesting booklet relating to the recent 21,250 miles reliability run of a Hotchkiss six-cylinder engine. The certificate issued by the R.A.C. in connection with the same is reprinted, and several illustrations are given showing the condition of the leading parts of the mechanism of the vehicle after the trial.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, DECEMBER 7, 1907.

[No. 457.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

“THE INDUSTRIAL MOTOR REVIEW.”

“THE INDUSTRIAL MOTOR REVIEW,” which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

“The Industrial Motor Review” is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

AT this season of the year we generally hear of motor-cars conveying parties to the hunting meets—as a matter of convenience. And we also hear the protests of many Masters of the Hunt—as a matter of course. The latest is from the North of England, where the Cheshire Hunt considers that motor-cars are being used in a way that is detrimental to the interests of fox-hunting. Subscribers to the Cheshire Hounds met a few days ago and passed a resolution directing their Secretary to call the attention of the Royal A.C. to the growing practice of motor-cars following hounds, and to ask that the influence of the Club should be used to put an end to the practice. Unfortunately for the universal success of such an admonition, we live in a busy age, and the saving of time and worry associated with the motor-car is too important to be lightly ignored.

Legal Activity.

FEW have any adequate idea of the amount of legal work that has been rendered necessary by the Motor Car Act—a department of activity that is on the increase rather than otherwise. This is proved by the figures forthcoming as the result of an examination of the number of cases in which the advice and assistance of the Legal Cases Committee and the Highways Protection Committee of the Motor Union have been sought. In September, 1906, these totalled 60, while for September of the present year the number was 120, and for October 135. Consequent upon the termination of the touring season, the volume of work for November in those departments was not so great. The cases numbered 87, and the amount of money voted by the Legal Cases Committee in November was a few shillings short of £200. Applications are received from all classes of society, and the subjects upon which advice is sought cover a very wide range. Apart from questions arising under the Motor Car Act, and the payment of a portion of the legal costs of the defence of members carrying the car badge and prosecuted for offences which the Committee regard as unsubstantiated by the evidence, there are disputes with makers, repairers, motor house proprietors, and insurance companies. If settlements cannot be arrived at in the ordinary way, the Union offers arbitration facilities. Support is given in appeals to higher courts, and in October success attended three such cases. In response to an appeal for subscriptions the Motor Union

received during October and November the sum of £63 8s. 6d. towards its Legal and Legislative Defence Fund.

Arbitration in Disputes.

THE department concerned with arbitration between buyers and sellers of cars has proved its economical utility on several occasions. Recourse to the law courts is generally expensive—the costs not being limited to those which are actually reported. If the parties to disputes could agree to submit their differences to an unbiassed person capable of comprehending the technicalities and the customs involved, motorists would gain in time, temper and money.

High Hedges.

COMPLAINTS as to the high hedges that are observable in many places, to the exclusion of roads and bye ways beyond, are coming freely and fast, following the Comment on this subject in our last issue. While we cannot see our way to publish a list of such dangers to users of the road, we would urge our readers wherever possible to communicate with the owners of such hedges—either through their automobile club or the rural council of the locality. In many cases such communications have had the desired effect of securing the lopping of the hedgerows or their removal altogether. For landowners are not only recognising the dangers of high hedges, but the fact that many are motorists themselves has given them practical object lessons of considerable value. It must be remembered, to the credit of the Local Government Board, that they recently circularised County Councils on the subject, urging the value of friendly negotiations between such bodies and local landowners.

The Legal View.

WITH regard to the legal aspect of the matter, we understand that as the law now stands, highway authorities have no control over the height of hedges. Section 65 of the Highways Act, 1835, does not empower local authorities to cause any tree or hedge that obstructs the view at cross and side-roads to be cut or pruned. The restraint of local authorities under this section is probably limited to the removal of actual obstruction to carriageways, and to the pruning and lopping of trees and hedges which exclude sun and wind from the roads, to the damage thereof. But where this damage to roads cannot be proved, there is no legal obligation on the part of the landowner. At the same time, common sense and a kindly feeling for others will secure the object in the majority of cases.

Cordingley's Motor Show, 1908.

INTEREST is growing in the next great British motor show, which will open at the Agricultural Hall, London, on March 21st, 1908. In connection with this we note that the *Daily Telegraph's* motoring correspondent, in his reference to the Paris Show, writes:—"As for the individual exhibits, there are all that were in Olympia, and many more besides, though in several cases the new model was shown in London, while the old type is staged in Paris. As an example of this, the S.C.A.T. 1908 model is not here, only the 1907 type. But this does not apply to the French makers; on the other hand, there are types in Paris staged that London has yet to see. Epicyclic gears are perhaps best exemplified in the S.C.A.R., manufactured at Rheims. In this car the third and fourth gears are direct on the live axle, different diameter crown wheels being enmeshed. A six-cylinder 35-h.p. chassis is staged, besides smaller models. Duhanot, the Italian "Standard," or F.A.S.T., as it is called in England, the Swiss Safr, the Eisenach or Regina Dixi, the H.I.S.A. (Hermes Italiana Societa Automobila), the Licorne or Unicorn; Belgica, Henriod, the Pax, are all cars that are on more or less standard

Touring in Spain.—A Daimler Car on the old bridge of Alcantara, Toledo.

lines, and probably will be seen at Cordingley's Show, so their distinctive characteristics can be left over till that event."

Motor Adventure in Abyssinia.

Not so very long ago, to journey across Shap by motor-car and run round Hindhead were adventures that became duly chronicled as items of news proving the progress of the automobile movement. Nowadays, such performances are daily incidents that call for no comment; and the car that cannot get over such roads has little chance to become popular. The Pekin-Paris trip, and many of the journeys by pioneer motorists in new countries, however, call for high qualities of man as well as of car, and deserve recognition. Of such an order is the trip now being undertaken by Mr. B. J. F. Bentley, in company with Mr. Wells, across Abyssinia and

Somaliland to Khartoum. But a few months have passed since Mr. Bentley, fresh from Egyptian travel, called at the office of the *M.C.J.* thirsting for new adventures and full of enthusiasm for a carefully projected journey by a new means of travel over new country. The intrepid motorists on their Siddeley motor-car have just been heard of within fifty miles of Adisababa. To reach that point, over 6,000 feet above sea level, they had climbed for twenty miles on end, they had run out of petrol on the way, and for fifty hours they were without food of any kind. Having to send on their boys to obtain the petrol, which should have been waiting for them, the travellers were left absolutely alone for five days and nights. They had to take it in turns in mounting guard over the car during the night, being fearful that hyenas might demolish the tyres. They were also at one time reduced by thirst to drinking the water out of the radiator. The journey lay off the usual caravan route, through a waterless area where there was no bird nor animal which could be shot for food. We await with interest the continuation of the story.

Profit by Stopping.

UNIQUE among shareholders in motor-bus companies has been the experience of those who financed the Torquay Motor-bus Company, the final meeting of which was held on Friday of last week. This was by no means a doleful gathering, for the liquidator was able to report that the company had not only returned the whole of the share capital, after paying a dividend of 7½ per cent. from the commencement, but was able to give the shareholders a bonus of more than 8½ per cent. on the winding up of the company. The chairman, Mr. W. Callard, pointed out that the directors' decision to close the concern was due to an intelligent anticipation of the coming competition of the electric trams. The motor-buses that were originally at Torquay are now doing service at Harrogate.

"The White Rose Mystery."

COMMENCING with a wretched cab-horse in Regent Street, the incidents in the latest novel of Mr. Gerald Biss come fast and furious to the conclusion of the thirty-seventh chapter of a book which sustains the interest of the reader over 300 pages. As becomes the White Rose Mystery, the plot radiates through aristocratic circles. Cabinet Ministers flit across the scene as thickly as lords at a motor-show, and the Earl of Portcullis, Viscount Stepney, Lord Ben Nevis, Lady Grizelle, Lady Bena Belsize, add distinction to the thrilling incidents which are pictured in an easy style which Mr. Biss has familiarised to many motorists in the free and easy columns of a contemporary. On finishing the book we have a desire for more from the same pen—and that is the best tribute to the author. Of course, there is a motor incident—no modern novel is complete without it.

The Event of 1908.

IN view of the interest that attaches to the annual Trial in connection with Motorism, and also the pecuniary expenses involved on the part of prospective competitors, it would be well if the Royal A.C. quickly came to a decision as to the limitations of its proposed programme for 1908. Already the trade element of the industry has notified their lack of enthusiasm for the suggested race in the Isle of Man, and the feeling is growing that one comprehensive trial is enough for any year. The outline of the 2,000 miles contest embraces the route of the Scottish Trial, and, although that event will continue as a separate contest for those firms who thus wish to be identified with this North British contest, its inclusion as part of the British test is regarded as a matter of course. We notice that Mr. R. J. McCreedy is putting in a plea for the Emerald Isle, the trials in which this year were mainly supported by amateurs as compared with the trade element; but, unfortunately for the suggestion,

there is a little strip of water between the two islands which would destroy the continuity of the road trial.

Motor Ambulances.

CONSIDERABLE attention has been given by the members of the Metropolitan Asylums Board to the subject of motor vehicles for the conveyance of their patients. In view of early additions to be made to the present motor-ambulances and motor-omnibuses owned by the Board, some difficulty has arisen with regard to arrangements for their accommodation. It has now been agreed to establish a motor garage department at Fulham, where a motor workshop will be installed and an inspection pit constructed. This will be under the control of a superintendent, and should help the scheme for the transfer of patients by motor vehicles which is now being developed. The Board is advancing in the direction of centralisation in connection with a policy which the vice-chairman of the ambulance committee (Dr. Gell) believes will effect considerable economies as applied to the conveyance of patients by automobiles. It will be remembered that it was at one of the Cordingley Motor Shows that members of the Metropolitan

resolved that the clerk to the Council should submit a case to a legal authority to ascertain whether this traffic might be brought within the category of "extraordinary," for which the District Council could recover damages.

A Code of Signalling.

IN our correspondence columns recently one of our readers made a suggestion which, although hardly likely, to be endorsed by the Legislature, may provoke some discussion. Several attempts have been made from time to time to institute a kind of universal freemasonry among motorists, but the rapid growth of the movement has rather tended to relegate such efforts into obscurity. Recognising that this matter requires careful organisation, the Automobile Association has done for the South what our correspondent, who resides in Scotland, suggests should become general. Unfortunately, his scheme of signalling by means of the horn would probably add another argument to the already full quiver of those who are inclined to oppose motoring on the ground of noise; or, for the matter of that, anything else which they do not entirely appreciate.

The German Emperor leaving the grounds of Highcliffe Castle in a Daimler Car. His suite is also seen following in three other cars of the same make.

Asylums Board made their first inquiries into the subject of the motor for ambulance purposes, making an afternoon's investigation which is now bearing considerable harvest to the motor industry.

Extraordinary Traffic.

CONSIDERABLE discussion has taken place at several centres in the North of England with regard to motor-wagons and extraordinary traffic, but the action of the Hexham Rural Council at their last meeting promises to bring the problem a little nearer legal solution. Mr. Surtess, the surveyor for the North Highway District, called attention to the growing motor vehicle traffic, and particularly to the instance of a motor vehicle taking coals from one local pit to various large institutions in the district. These travel over some of the roads which, while quite sufficient for the ordinary cart traffic, were, in his opinion, quite unfitted for the heavier class of traffic we have mentioned. Ultimately the Council decided to inform those responsible for this motor traffic that certain bye-roads were decidedly unsuitable for such traffic, and it was also

Welcoming a New Chassis.

To celebrate the amalgamation of the interests of the Eadie Company, of Redditch, with those of the Birmingham Small Arms Company a dinner was held on Thursday of last week at the Trocadero Restaurant, London, over which Mr. Albert Eadie presided, supported by Messrs. R. M. Smith, C. A. Hyde, Kenneth Davis, and several others. The new B.S.A. chassis having been rightly eulogised, a good word for the motor Press was spoken by Mr. Albert Brown, whose knowledge of the subject adds weight to his observations. He dwelt upon the integrity and unbiassed attitude of that section of the Press, deprecating the practice of some of the other journals in misleading the public as to the reduction of prices and similar matters upon which they imagined vain things. Mr. A. W. Gamage was also among the speakers, his equanimity in no way impaired by the fire of last week.

At Hong Kong the Oriental Battery Company have opened a works to make dry batteries for service with automobiles there, where the motor-car is rapidly advancing in popularity.

A TOUR IN BRITTANY.

A TRIP round Brittany, in connection with a tour of Normandy, will require an additional five or seven days, and the two, combined with Touraine, say three weeks, allow at least a nodding acquaintance with the charms of these three fairest and most picturesque provinces of France. If Normandy or Touraine be considered separately, and one goes out direct from Paris, there are 250 kilometres of the Route de Bretagne before Mayenne is reached *via* Alerçon, or 300 to Laval *via* Chartres and Le Mans. It is a superb itinerary by either route, but if one is bound for St. Malo and the Côte d'Emeraude, or Concarneau and its *plages*, there is still the matter of another 300 kilometres to roll off before one arrives at the objective, and one will have no time to linger *en route*, save to make such passing observations as fancy suggests.

From Paris the best route is out *via* Versailles, Chartres, Nogent-le-Rotrou, and Le Mans, through the very heart of one of the finest agricultural regions in all France, with Routes Nationales all the way, great tree-bordered, sandy-surfaced roads without flints, hidden level-crossings or bad curves, save here and there where one passes through some little old-world village with a cobble-paved main street. It is in these crowded little French towns that most motor accidents happen; but the local authorities generally cut the *vitesse* down to twelve, ten, or six kilometres an hour, and put up great staring signs reading "*Ralentir*" or "*Virage Difficile*," so it is one's own fault if anything happens. What the motorist needs to look out for before and after coming to a town are the *culverts* and *caniveaux* crossing the road; many a back spring has been broken by taking them at a speed above a dozen miles an hour. Generally they are marked, and so, too, are dangerous cross roads, by the distinctive signs of the French Association Generale Automobile.

From Le Mans, practically the gateway to Brittany, it is another hundred kilometres to Laval. Coming out of Paris, lunch at Nogent le Rotrou, at the Hotel du Dauphin. There is nothing of *luxe* here—simply plain, bountiful fare, cooked and served by the *patron-chef* of the hotel (*vin compris*), and charged for invariably at the same price, whether you be a peasant-farmer in town for the day with a donkey cart loaded with vegetables or an automobilist in a flying "fifty." This is the charm of French travel by road. It is only in the resorts, like Biarritz, Vichy, Trouville or Aix-les-Bains, that one pays through the nose, as the French say. Nogent-le-Rotrou is worth an hour after lunch, looking over its three mediæval monuments, its two churches dating from the tenth to the fifteenth century, and its eleventh-century ruined chateau, unspoiled by modern embellishments.

It is sixty-seven kilometres to Le Mans and a hundred more to Laval, where you may sleep at the Hotel de Paris or keep on another thirty-five kilometres to Vitre, by which time the entire

topographical aspect of the land has changed and become sterner, with more of what the quality artists call character and less of the scenic prettiness of the stage. Laval is really worth seeing. It is an admirable relic of an old mediæval town, with a twelfth century donjon, a Renaissance chateau, a twelfth century church and a fortified gateway, besides a history made vivid by its seigneurs of the *moyen age*. Indeed, Laval and its neighbour Vitre, with an excursion to the Chateau des Rochers of Madame de Sévigné, are, taken together, worth a day's sightseeing.

Vitre's chateau is the best photographic subject among all the chateaux of France, save perhaps Langeais, in Touraine. At Vitre the Hotel des Voyageurs, besides the railway station, has good, but small garage accommodation, and *chambres hygiéniques*, installed at the suggestion of the Touring Club de France. The

combination, with the very excellent fare and the extremely moderate charges, will be hard to beat in all Brittany or Normandy. For that reason it is worth making a long day to arrive at Vitre for the night. The excursion to the Chateau des Rochers should not be omitted. It is five kilometres from Vitre, along a beautifully boulevarded roadway, quite different from what it was in the days of Madame de Sévigné, when that accomplished letter-writer informed her daughter, Madame de Grignan, that "finally she had arrived," after having made the last league on foot, leaving her coach stuck among the rocks and mud of a slough. There is nothing very massive about the chateau, but its *ensemble* is exceedingly picturesque. One may visit the chapel and the *chambre* occupied by Madame de Sévigné, and may walk in the alleysed park and be told by the *concierge* that *par ci* and *par là* Madame la Marquise used to take her promenades. A very beautiful garden it is, too, designed by the great Le Notre, who laid out the gardens of Versailles.

If one will, he may go on to Rennes, thirty-five kilometres, the ancient capital of the province, but it is a stuffy, pompous town, with hotels always full to overflowing with congressionists of a medical conference or something of the sort, and motorists have a scant welcome. The only thing of note to see at Rennes

is the Council Chamber of the Palais de Justice, where the Parlement de Bretagne formerly sat. The writer has got a rule for touring which invariably works well; make one's stopping place a small town, not a large city; leaving price out of the question, it is more amusing and the fare is better and more characteristic, and that verily is what one wants, or ought to want, when travelling by automobile. Cut Rennes out, then, and go north from Vitre to Fougères, twenty-eight kilometres. Merely a sight of Fougères, *en passant*, is worth coming miles for. It is, outside of Carcassonne, one of the best examples of a decrepit old walled town to be seen in France. It is palpably a ruin, and its walls and towers, crenelated battlements and pinioned chateaux are all inextricably mixed in such a maze of architectural wonders that it looks more like a thing of the

Touring in France.—A Mors Car at the Gate at the entrance to the town of Besançon.

imagination than reality. Not many tourists—automobilists or others—"do" Fougères. This is a pity! Anyway, pass through it *en route* for St. Malo, Dinan and Dinard. From Fougères to Dinan, *via* Dol, is seventy-eight kilometres and about the same to St. Malo. The former is preferable, as it allows one to make a gorgeous excursion by a little steamer down the Rance to St. Malo and Dinard. It is a trip not to be missed by all lovers of the beautiful. From Fougères to St. Malo, including the steamer trip, is good for a day. The Hotel de France et Chateaubriand—the ancient home of the author himself—is very good indeed, but a typical tourist hotel where one eats at one of those interminable long-drawn-out tables d'hôte.

The historical monuments of St. Malo and its neighbour, St. Servan, their cathedrals, the Chateau, the old fortifications, the Tour Solidor, &c., are wonderfully interesting, and the green sea and blue sky setting of it all is as impressive as anything of its kind in nature or art. From St. Malo westward to St. Brieuc is the Cote d'Emeraud, one of the beauty spots of the coast line of France. It is lined with little resorts and detached villas, and the panorama is only comparable with that of the Riviera

coast towns of Plouha, Paimpol, Tréguier (Renan's birthplace) and Lannion. Practically this detour will take a day. There is much of interest *en route*, and it is worth going slowly over the ground. If one leaves Guingamp in the morning—a much better stopping place than St. Brieuc, though both are full of quaint houses, curious shops and architectural surprises—he might lunch at Tréguier, spend an hour in the afternoon at Lannion, full of curious old wood and stone houses, or stop *en route* and have a look over the old Chateau de Touquédec, ten kilometres distant. This last is a grand old ruin of the fourteenth century, with a donjon with walls ten or a dozen feet thick, and all the accessories of a mediæval fortress-chateau. The road drops down from Lannion in thirty-six kilometres through a wild, savage region with sharp descents to Morlaix, the Sous-Préfecture of Finistère. The Hotel de l'Europe is double starred in the Guide Michelin and the Hotel de Provence bears a single star, but the latter is decidedly preferable. Each has garage accommodation of a very acceptable kind.

There are numerous sights at Morlaix in the town itself, and the excursion to the fourteenth-century fortress, built by

Touring in France.—A Curious Old House at St. Lo.

—the Cote d'Azur and Biarritz, and about there—the Cote d'Argent, with, of course, quite a different colour scheme. From Dinan to Brest, almost to the extremity of Finistère, is something over two hundred kilometres of exceedingly picturesque rising and falling *route nationale*. Generally speaking, the surface is good—the best in Brittany—but there are many hills not so heavy in grade as the cross-country routes, say from Dinan to Vannes or from Morlaix to Quimper, but annoying all the same, for it means a continual coaxing and pushing of one's car in order to keep moving without being obliged to change speed.

After Dinan comes Lamballe, St. Brieuc and Guingamp, all typical Breton towns, peopled with a sturdy, dark-skinned folk, who are becoming so used to intercourse with strangers that they have lost not a little of their former picturesqueness. The *chapeau de paille* and the *gilet rond* are giving way to an imitation *panama*—made in Madagascar—and a sweater knitted in Nottingham. Farther west in Finistère, and in the Penmarc'h peninsula, the costumes of the peasant men and women are, more or less, as they were a hundred years ago. A detour of a hundred kilometres might be made from Guingamp, *via* the

the bourgeois of Morlaix as a defence against the English, in the Rade de Morlaix, a great land-sheltered bay or harbour, should not be omitted from the visiting list. Directly north of Morlaix, twenty kilometres out and back, is St. Jean-du-Doigt, a famous place of pilgrimage among the Breton fisher folk of Finistère and the Côtes-du-Nord. In the church is preserved as a relic the index finger of the right hand of St. John the Baptist. The great religious fête, known as the pardon of St. Jean-du-Doigt, takes place on June 23rd in each year, and is perhaps the most celebrated of all these great religious pilgrimages of Brittany.

(To be concluded.)

THE catalogue of artillery motor wheels, axles and springs issued by Messrs. Smith, Parfrey and Co., Ltd., of the Pimlico Wheel Works, Rannoch Street, Fulham Palace Road, London, W., is fully comprehensive of the productions of this firm, whose electric welding plant has enabled them to do successful work in many ways, such as welding new gear wheels into a solid shaft without disturbing the others, and fitting new parts to broken crankshafts.

SOME NOTES ON THE PARIS SALON.

ONE result of the coincidence of the annual British and French Shows was that very few visitors from this side of the Channel were seen in Paris during the early days of the *Salon*. Last week, however, the position was changed, well-known English motorists being met with at every turn in the large building in which the famous Show is held. The *M.C.J.* has already so fully dealt with the new features and novelties to be seen, that I do not propose to do more than give a few of the impressions that forced themselves upon me as I scampered—for scamper it is, if one means to visit every nook and corner—through the huge Grand Palais. I arrived on the scene on Friday morning last week to find a sort of mild disturbance going on, the tooting of horns and the shrieks of sirens seeming to indicate that the end of the Show, which took place on Sunday last, was being antedated. On making enquiries, it was found that the day was being made the occasion of a fete in aid of the fund for the sufferers in the recent floods in the South of

which has always been prominent at previous shows, while M. Chaboche, who has for long supported the steam car section, is now centring his attention on industrial vehicles, his stand being, consequently, relegated to the Annexe. As to the petrol cars, it was observable that, while the old-established makers are still building high-powered vehicles, many of them are also now introducing one of medium power, say from 15-h.p. to 20-h.p., while it will be interesting to the motorist of moderate means to learn that much more attention than ever is being devoted to his needs. Hitherto the small car has been, except by one or two firms, somewhat neglected by French builders, but now a mention of only the names of a few of the vehicles that were on view—the Sizaire-Naudin, Delage, Lion-Peugeot, Dorey, Passe Partout, Werner, Turicum, &c.—is sufficient indication that makers are at last recognising that there is a vast field still to be exploited. As regards transmission, while the struggle for supremacy between the cardan shaft and side-chain systems still continues—with the honours lying with the former—it was interesting to note the

The End of the Paris Salon.—The Scene Outside the Grand Palais on Monday last.

France, and that not only had the charge for admission been raised to 10 francs, but the fiat had gone forth that no tickets—not even exhibitors' tickets—would be accepted. This order raised quite a storm, for many of the *exposants* of cars gave orders for their stands to be covered up, while those in the Galleries announced their disapproval in the manner alluded to above. Eventually, however, the objectionable order was rescinded and all was peace.

Entering the familiar building, the visitor immediately found himself amidst the stands, the artistic design of which has not by any means been over-described, while one great improvement was seen in the covering of the old shingly floor by matting, an innovation which was not only much better to walk upon, but was found advantageous by exhibitors in the greatly reduced amount of dust that was raised. From one point of view, that of the steam car enthusiast, the Show was disappointing; petrol reigned supreme, not a single steam car being included in the display. The early death of M. Leon Serpollet has caused the disappearance of one exhibit

appearance of three or four cars in which for purposes of simplicity and low cost the drive is by belt, and also of a number in which the ordinary type of gear-box is replaced by a friction disc transmission, by means of which any desired speed between the minimum and maximum available can be obtained by the movement of a single lever. Although this idea is by no means new, and in many quarters looked upon as being impracticable for automobiles, yet the increase in the number of manufacturers adopting it would seem to indicate that many of the difficulties which, it is held, have hitherto been associated with it are now being overcome.

Attention has already been drawn in these pages to several of the novel engines to be seen, among them the Burlat and the R.E.P. of M. Esnault-Pelterie. I have, however, not seen any reference to the Eudelin, which is of an exceedingly interesting type, the feature being that by an ingenious arrangement the stroke of the piston can be varied, enabling the motor to develop full power at varying engine speeds, and so practically obviating the need of a change-speed gear.

There appears to be a pronounced tendency to cast the four-cylinders of the engines of the cars of relatively low power in one block. The aim is to reduce weight to a minimum, so as to economise both as regards fuel consumption and tyre expense, the *bloc* motor being lighter because the walls of the water jackets between the cylinders are dispensed with, and more compact, because the distance between adjacent cylinders is reduced to a minimum. The chief objection to the design is, of course, that if a defect develops in the cylinder walls during the process of manufacture or later, the whole casting may have to be thrown away, instead of only a single cylinder, or a pair, in the usual way. During the past few years, however, ironfounders have made considerable progress in cylinder casting, and the proportion of defective castings is now comparatively small if the product is obtained from a foundry that specialises in this class of work.

Greatly increased attention is being given to the question of petrol engines which work on the two-cycle system—that is to say, there is an explosion in each cylinder at every revolution of the crank shaft as against one for two revolutions in the four-cycle motor—the number of exhibitors of cars with two-cycle engines, although still small proportionately, showing an increase, a remark which also applies to combination petrol-electric vehicles. One point which greatly interested me was the pains taken by many of the manufacturers to render their exhibit of an instructive as well as of attractive nature, the working model of a De Dion chassis cut in half and enclosed in a glass case, and the Gobron-Brillié engine with glass cylinders being two of the things which call for remark in this category.

I had only time for a rapid glance through the carriage builders' section, where the principal features of note were the great preponderance of the covered body, and the increasing practice of suspending the rear portion of the carriage on separate C springs. The accessory display in the Galleries was full of interest; as usual, non-skids, spring and "elastic" wheels were shown by the score, while the novelties in the tyre section included one made of paper, and another which to be inflated has first to be punctured! As regards ignition, the outstanding feature is the almost universal adoption of magneto ignition—more particularly the high tension pattern.

Having seen the reference to the Retrospective Exhibition at the Annexe in the *M.C.J.*, I naturally made a point of visiting it, as a result of which I can fully endorse all that has been said of this very interesting collection of historical cars. The first vehicle that met the eye on entering the Annexe was Cugnot's steam car of 1760, succeeding which were, among others, one of Herr Gottlieb Daimler's early productions, the first Panhard, the first Renault, the first Delabaye, to mention only a few. One of the strangest of the lot was the first Berliet, dated 1900, and, having inspected only a few minutes before the exhibit of the Berliet Company in the Grand Palais, it was difficult to imagine that but seven years had elapsed since it had first seen the light. It seems a pity that such a collection of historical relics, having been once got together, should not be found a permanent home in some public building, where they would form a lasting tribute to the efforts of the early workers in a movement which has developed with such lightning speed.

C. J. W.

THE Automobile Club of America has accepted the invitation of the Florida East Coast Automobile Association to take over the management of the sixth annual race meet on the Ormond-Daytona beach, which will take place in March next. This step has been taken with the view of making the tournament more international in character than hitherto. The programme, which is being drawn up by the Contests Committee of the A.C.A., will include long and short distance races. The mile race for the Sir Thomas Dewar Trophy will take place as usual, and in order to prevent the entry of what has been known as "freak" cars, the committee will insist that all vehicles entered for the mile and two-mile-a-minute races will have to qualify by going at least twenty miles at a minimum speed of about 45 seconds to the mile.

SUBSTITUTES FOR THE DIFFERENTIAL GEAR.

MANY attempts have been made to obviate the use of differential gears in motor-cars. Among these is the Hedgeland equaliser, which was introduced about two years ago, of which, although it attracted a good deal of attention in this country at the time, little has since been heard. However, we learn that in the meantime the inventor has been busily engaged in perfecting the idea, which in its improved form has now been put on the market by the Hedgeland Manufacturing Company, of Canton, O., U.S.A. While the underlying principle

Fig. 1.—Sectional View of new Hedgeland Equaliser.

remains the same, the design has been considerably changed from its original conception. As shown in Fig. 1, the clutches have been moved to the centre, and the axle is divided, as when a differential is used. A and B are screws milled from the solid bar, both right hand pitch, of about 23 degrees thread angle. A is fast on shaft K, and B on shaft J. On these threads are double cone steel clutches C and D. The clutch faces are hardened, but the threads are left soft. Around the outer edge of C and D are steel rings E E, which are split on one side and act as a light-pressure friction brake on the clutches. The rings are free to move endwise with the clutches, but must always revolve with the casing, as each has a forked jaw which

Figs. 2 and 3.—Diagrams illustrating the action of the Hedgeland Equaliser.

engages with one of the keys F. There are three of these keys, and besides holding the rings E from revolving they serve to limit the end motion of the clutches. The clutches make contact with the forged steel cups formed in G, H, and I. The action is as follows:—The gear or chain wheel attached to I turns the entire case; the resistance of the shafts K and J to turning causes them to lag behind, and as C and D are rotated by the friction of E E they move endwise on the screws A and B until they make contact with their cups. If the car is going straight ahead the contact is as shown in Fig. 3. If going straight back in the reverse direction it would be on the opposite faces. The clutches cannot slip, for the more power it takes to drive the

car the tighter are they pressed together. Suppose the car is turned towards the side K, clutch C continues to drive as before, but the outer wheel turns the screw B faster than I is turning, and throws out the clutch D. The latter runs over until it bears lightly against C and then turns uniformly with B. The relation of the friction surface at this time is shown in Fig. 2. When turning towards the side J the action is similar; only the clutch D drives; C is free and is held from going too far by keys F. There is no movement between the clutches and their brake

Fig. 4.—The F.R.V. Gearless Differential. The view shows the position for straight ahead driving.

bands except when turning a corner. The inner wheel always drives, and no power can be wasted by spinning the idle wheel on slippery surfaces. With this new arrangement of parts the axle can drive the engine while running down hill, with the main clutch engaged, so enabling the motor to be used as a brake.

Another substitute for the ordinary differential is the "F.R.V. gearless differential," which is being introduced by the F.R.V. Auto Parts Company, of 116, Nassau Street, New York. The principle of the arrangement is that the usual bevel or spur gears are replaced by two sets of face ratchets. The two ratchet discs A and B are attached to the driving axle halves and, by

Figs. 5 and 6.—Diagrams illustrating the action of the F.R.V. Gearless Differential. The first view shows the position when turning a left hand corner, and the second that when the reverse motion is in operation.

means of a disc spring E between them, engage with the female ratchet parts C D cut on the inner faces of the casing, as shown in Fig. 4. To the casing is attached the bevel driving gear, and when driving in a forward direction the male ratchet members, which are longitudinally free, engage with the ratchets in the case and thus apply an equal driving stress to each wheel. If, however, a corner is turned the outer wheel overruns the ratchet on the inner side of the case, and the male driving ratchet is forced out of driving engagement, the disc spring

being compressed, as shown in dotted outline in Fig. 5. The reverse drive is as positive as the forward because of the proportions of the parts, which are such that both male ratchets cannot be overrun at the same time. That is, the reverse driving action tends to overrun both ratchets, but the male members are of such thickness that they abut, and a wedging action is set up between them and the driven ratchets, as in Fig. 6. As will be observed, the chief feature of this device is that it differentiates for distance and not resistance. On this account the device is claimed to eliminate all tendency to skidding which can be attributed to the action of the differential as commonly employed.

A MOTORIST'S VADE MECUM.

A COMPACT and ingeniously contrived fitment cabinet of solid mahogany has been designed for motorists by Messrs. Waring and Gillow, Ltd., of which we give an illustration. It is so replete with useful appliances that it might almost be called the "motorist's vade mecum." Nothing is omitted which

a tourist is likely to require during a long journey, the sixteen drawers of the cabinet being fitted with every requirement of the dressing table, the luncheon basket, and the writing desk. The central portion is occupied by a white metal washing basin, enclosed with folding doors. The top forms a shelf for brushes and toilet appliances, with a sliding swing mirror at the back. There is also a flap which can be drawn up to form a writing desk. The surrounding drawers contain a luncheon service of china, glass, plate, &c., for six people, a dainty china tea service, a kettle with spirit lamp, a stationery cabinet with writing materials, a bookcase, cigar cabinet, a supply of articles necessary in case of accident or emergency, a fitted dressing case, a clock, a barometer, and stoppered decanters and flasks. The whole contrivance is a capital example of multum in parvo, the full dimensions being only 5 ft. 2 in. high, 4 ft. 6 in. wide, and 9 in. deep.

THE St. Albans and Luton Motor Company, Ltd., have now control of the motor works in the New Bedford Road, Luton, of which branch Mr. A. E. Clarke has been appointed manager. The garage is on the main London to Bedford road, and not only is it well equipped for motor storage, but an efficient staff of practical engineers will attend to the requirements of motorists.

A MOTORIST'S CAUSERIE.

THERE comes a time, I suppose, when all motorists suffer from tyre troubles. One concern is now guaranteeing its tyres for 4,000 miles, which should do much to give their particular make considerable popularity. I have not yet covered that distance with my present set—which are not those referred to above, by the way—but have already begun to suffer delay and worry by reason of frequent punctures and bursts, and have lately had to pay out some fairly large sums for repairs. The object of this note is to elicit the opinions of fellow-motorists with regard to re-treaded covers, for at the present time, as a result of recent trouble, I am somewhat in doubt whether the game is worth the candle. My first trial of having a cover re-treaded was all right; it has run a considerable distance, and seems to be standing up splendidly, notwithstanding that when it was sent to be repaired it had a nasty large hole which extended right through the rubber and canvas. The second experience, however, was exactly the reverse, for the cover, the re-treading of which cost nearly £2, only carried me about twenty miles when it burst in an irreparable fashion. On com-

by the exhaust cut-out. My motor is of a high compression type, requiring frequent cleaning, which would have been very expensive if I had had to remove the cylinders for the purpose. With the aid of the above described outfit I can do the job in an hour—there are two cylinders—and can get the whole inside surface absolutely clean. Of course it is necessary to do the work thoroughly, as otherwise partially loosened fragments of carbon would heat much more readily than when firmly attached and would only aggravate pre-ignition."

AN old car always has a certain amount of rattle, which may be much or little, according to the quality and age of the vehicle and the attention it has received. The hinges of the bonnet may be loose, the brake and change-gear lever connections may have probably worn loose; these are two items of a list which might be almost indefinitely extended. Many of these things have nothing to do with the condition of the principal bearings of the engine and transmission, which, after they have been properly taken up or replaced, may be as good as ever. Even if the looseness does not indicate immediate danger it is always annoying and is liable to lead to trouble, owing to the

The above illustration depicts the Swasi Chiefs, at present on a visit to England, just before their start to Buckingham Palace to inspect the King's horses, on a 40-h.p. Six-wheeled De Dietrich Pullman Car, placed at their disposal for the day by Messrs. Jarrott and Letts.

The Chiefs who were taken in the car were Prince Malunge N'Kosi, who appears on the extreme left of the photograph wearing a slouch hat; Chief Ngo'ool, seen on the right in a cap; and Induna Manikiniki, who acted as interpreter. They were delighted with the car, and were particularly interested in the electrical fittings, pressing the buttons, switching on the light, and communicating with the driver on their way down to the Palace.

paring notes with some fellow-motorists I find that several of them had a similar tale to tell, one indeed going so far as to say he had done with re-treaded tyres.

So many motorists appear to suffer from pre-ignition troubles due to carbon deposits on the piston and explosion chamber walls of their engines that the method adopted by an American automobilist to get rid of the deposit will doubtless be of interest. Mr. H. L. Towle, the gentleman in question, writes:—"I have found the best way to clean carbon from motor cylinders, without removing the latter, to be by the use of small iron scrapers, suitably bent to be introduced through the sparking plug holes or the plug holes over the valves, according to the type of cylinder. Injecting paraffin softens the carbon or dust deposit, but in my own motor, at least, I never found it to have much effect in detaching it. To aid in the exploration I use a small battery lamp, protected by a cage of wire and introduced through the opening over the valves. I use also a dentist's flat mirror to help me to see around the corners. My own practice is to take out the exhaust valve and scrape the debris into the valve chamber, from which it is carried into the silencer, or out

fact that the rattle obscures sounds of knocking or other troubles in vital parts of the engine and gear. It is worth while once a season to go carefully over the principal sources of noise. It is frequently possible to make even an old car run as quietly as a new one by a comparatively small amount of work, which, if done when the car is dismantled, can be effected at a small cost.

THE habit which many motorists fall into of running the engine continually at its top speed is one to be deprecated. The effect is additional wear upon the piston and cylinder, owing to the increase in piston speed, and also on the gudgeon pin and big end bearings. Supposing the normal speed of the engine to be 1,000 revolutions per minute, accelerating to 1,200 r.p.m. means that, if the engine is habitually run at the latter speed, it makes no less than 12,000 revolutions per hour more than it is intended to do. Acceleration is provided to give an increase of power when required for short intervals.

ARCANUM.

At Banbridge, on the main road to Belfast from the south of Ireland, a motor repair establishment is being established by Mr. T. Sloan.

CONTINENTAL NOTES.

Motor Vehicles for Military Purposes in France.

The French military authorities continue to give indications of the careful way they are watching the progress of industrial motor vehicles: During the course of the *Salon*, which closed on Sunday last, about sixty students of the Military School at Versailles paid a visit to the Annexe, where M. Girardeau gave a lecture on the military uses of industrial motor vehicles. The advantage of holding the meeting at the Exhibition lay, of course, in the fact that the lecturer was able to illustrate his remarks by the actual vehicles that were shown.

The Paris Salon.

The tenth annual Paris *Salon* was brought to a successful conclusion on Sunday last, the 1st inst. Throughout the day the huge Grand Palais was packed with visitors, and in the

the first-named category the Prix d'Excellence went to Messrs. De Dion-Bouton and the Grand Prix to the Mors Company, while the Delaunay-Belleville Co. carried off the Elegance prize.

Preparations for the 1908 Racing Season.

Both the Benz and the German Daimler Companies intend to take part in the principal races and competitions in the 1908 season. Hanriot and Hemery will be included in the former's team of drivers and Poege and Salzer in the latter's. The Fia and De Dietrich concerns will again be to the front, their car being entrusted to the same men as in 1907, viz., Nazzaro, Lancia and Wagner for the first named and Duray, Gabriel and Rougier for the Lorraine-Dietrich.

Miscellaneous Items.

It is reported that arrangements are in hand for the establishment of a motor-car service between Alexandrette (Syria) and Bagdad.—The German Automobile Exhibition was, in the

Customs Formalities on the Continent.—1, Bavaria. 2, Austria. 3, France.

evening great interest was shown in the Tombola. It may not be generally known that every visitor to the show received a numbered ticket entitling him to participate in the draw for the hundred or so prizes—ranging from a motor-car to a repair outfit—which are annually offered by various firms in connection with the exhibition. We have not space to print the whole list of prize-winning numbers, but, in case some English visitors hold the lucky numbers, we give the first six:—

No.		Winning No.
1.	De Dion 15 h.p. Car	143312
2.	E. V. M. Bicycle	198568
3.	Hurtu Bicycle... ..	681448
4.	Sabine Bicycle	604107
5.	Nilmelior Magneto	437529
6.	Pair of Vinet Detachable Rims	585102

A number of awards were also made in connection with the best decorated stands and for the most elegant carriage bodies. In

absence of the Kaiser, opened in Berlin on Thursday by Prince Henry of Prussia.—A company has just been formed in Paris with a capital of £28,000, and the title *La Société Française des Chaines*, to manufacture motor-chains in France.—The King of the Belgians has just placed an order for a 40-h.p. De Dietrich, which is to be fitted with a limousine body.—The Isotta-Fraschini car which Minola drove to victory in the contest for the Florio cup, on the Brescia circuit, has been bought by Mr. George West, jun., of Ballston Spa, N.Y., who will drive the vehicle in all American road races during the coming season.—The most successful attempt at aerial navigation yet made was that of the crew of the French military airship "La Patrie," on the 23rd ult., when the Panhard engines propelled the machine from Chalais-Meudon to the frontier—a distance of 236 kilometres.—"La Patrie" has since disappeared, its fate being still unknown.

THE Renard road train has been attracting much attention at Manchester, where it was unshipped at the docks on the way from Ireland to Coventry.

AUTOMOBILE exhibits were shown in the workshops of the Northampton Polytechnic Institute, Clerkenwell, in connection with the presentation of prizes by the Duke of Connaught, K.G., on the 29th ult.

AN order for Argyll motor-cabs to the value of £20,000 has been placed in London. Should success attend this development it may be increased to £80,000 ere long.

THE Board of Education has approached Messrs. Rudge-Whitworth, Limited, with a request for an exhibit for the South Kensington Museum consisting of a Rudge-Whitworth patent detachable wire wheel.

It is reported from Meltourne that a road record has been set up of 422 miles in twelve hours and 777 miles in twenty-four hours, by two motorists named Stevens and Jones, on a Dunlop-tyred Darracq car—the gentlemen named presumably driving in turns.

MESSRS. HERBERT TERRY AND SONS, of the Novelty Works, Redditch, send their new list of springs, wirework clips, &c., for the motor and other trades. The firm's productions have long been before the industry, and the new list will be of value to all requiring such work.

THE Companies' Diary and Agenda Book for 1908 has just been published by Messrs. Jordan and Sons, Ltd., the well-known company registration agents. It is indispensable in the offices of limited liability concerns, and will be found useful in all commercial establishments.

BEFORE the Canals and Waterways Commission, Mr. J. K. Bythell, the chairman of the Manchester Ship Canal Company, referred to the growing motor-wagon competition between ten to fifteen miles round Manchester. This is likely to increase in the near future, adding another difficulty to the problem of successful canal administration.

THE committee which organised the recent provincial meets of commercial motor vehicles met last week and formally dissolved itself. Mr. Leo Harris, the hon. secretary, submitted the statement of accounts for the Reading meet, which showed an expenditure of £61 with an income rather less. The balance, £1 18s. 4d., having been contributed by the hon. secretary, the accounts have now been closed.

IN May last Mr. S. F. Edge instituted a tyre economy competition among drivers of six-cylinder cars, prizes of £25, £15 and £10 being offered for the best distances covered by any four tyres. Mr. A. Waters has proved first, the car he drove having run on each of its four tyres an average of 5,910 miles; Mr. T. Brockell second, with 5,396 miles; and Mr. F. G. Toye, third, 5,302 miles. The total average of all the cars competing works out at 3,835 miles.

UNDER the title "Ignition Devices for Motors," Mr. Guilbert Pitman, of 85, Fleet Street, London, E.C., has just published a new work by Mr. S. R. Bottone. As the title implies, it deals more especially with the different ignition systems employed on petrol motor vehicles, and the information and illustrations given should prove extremely useful. A good deal of space is devoted to describing the construction and ignition of induction coils and magnos, while an interesting chapter is given in which there are many useful hints as to the choice and management of motor-cars.

MR. F. R. DAVIS, of Shawford, Winchester, is responsible for a paraffin carburettor, which seems to fulfil the requirement mentioned in the report of the Fuels Committee of the Motor Union as to the essential necessity that any such device should secure "a mechanical and accurately measured feed of the liquid fuel." In view of the attention now being given to the subject the carburettor is of particular interest, and reference may usefully be made to the fact that its merits were recognised in the *M.C.J.* of April 20th last, when we published an illustrated description of the device.

HERE AND THERE.

No less than forty-two per cent. of the motor-cars and motorcycles exhibited at the Stanley Show were fitted with Continental tyres.

MR. WALTER JACKSON, the well-known Yorkshire automobile engineer, has offices at Tanfield Chambers, Bradford, and garage and repair shops at Baildon Bridge, Shipley. The latter are open all the twenty-four hours of the day.

THE Electrical and Motor Company have a garage open day and night opposite the Town Hall, at Banbury. They have accommodation for fifty vehicles.

TURNER'S MOTOR MANUFACTURING COMPANY, LTD., Wolverhampton, inform us that they are producing for next season a new model 10-h.p. Turner-Miesse steam car fitted with cardan shaft transmission and two-seated body.

MR. CLIFFORD-EARP has given notice that he wishes to attack the present records for touring cars for the following distances on the Brooklands track, viz., fifty miles, one hour, one hundred miles, one hundred and fifty miles, and two hours.

A 12-16-h.p. Vauxhall Landauet supplied to the order of Dr. J. Kingston Barton, of London, who always drives the car himself. It will be observed that one seat can be entirely removed and taken anywhere to fetch the passenger if desired.

THE Avon India Rubber Company, Ltd., of Melksham, Wilts, whose excellent motor tyres we have recently noticed, are specialising in repair work. Many tyres they have repaired have run from five to ten thousand miles, and they were the first of the firms to introduce the system of vulcanised repairs to motor tyres.

FROM Messrs. Donne and Willans, Ltd., comes a copy of the illustrated catalogue of Piccard-Pictet cars, for which they have just acquired the British agency. Three sizes of four-cylinder vehicles are being made, viz., 12-16-h.p., 18-24-h.p., and 28-40-h.p., as also a 28-40-h.p. six-cylinder. The list gives full particulars of the cars, which throughout are on modern lines and comprise a number of special features.

THE Continental Tyre and Rubber Company, whose non-skids have obtained a high reputation in the past, have, after repeated experiments, produced a tyre that will not harm the road surface, or reduce its effectiveness as a non-skid. These tyres are manufactured in the well-known black and red rubber style introduced by the Continental Company, while the steel studs have been considerably shortened, and only project sufficiently above the rubber to preserve their non-skidding qualities. A further improvement has also been made in the canvas backing which will greatly add to the life of the tyre.

MR. JOHN ADAM, who is well known in connection with the Scottish Trials, has become the possessor of a Sunbeam of 20-h.p.

MESSRS. WITTLER AND BURDEN have taken over most of the tools of Mr. F. Moller, Ackland Street, Adelaide, Australia, and are developing business in the automobile trade.

AMONGST recent purchasers of Itala cars are Sir William Eden, who has ordered a 40-h.p. four-cylinder vehicle, and Lord Tollemahe; the latter's car is an 80-h.p. six-cylinder.

THE Archbishop of Canterbury, accompanied by Mrs. Davidson, has been making a tour by motor-car through the scattered parishes in the Romney Marsh grazing district.

THE third edition of their "Useful Hints and Tips for Automobilians" has been published by Messrs. Liffé and Sons. They are nearly 600 in number and embrace practically all the difficulties likely to occur to motorists.

THE sixth annual report of the Pembroke Technical Instruction Committee, co. Dublin, has been issued by the Secretary of the Congested District Board for Ireland, and emphasises the fact that the success of the Ringserd motor classes has been due in a great measure to the Siddeley motor-car provided at the commencement of the session. This has been run over 7,000 miles, mostly by motoring pupils.

MESSRS. WILLIAM TUPHOLME AND SONS, LTD., of Bridge Street, Sheffield, have recently introduced a new pattern of their motor spirit safes. As will be seen from the accompanying illustration, the special point in the improved model is the ventilation; the old form was by movable chimneys, whereas the ventilators are now fixed. The ventilation tubes are fitted with Davy gauze, thus making them perfectly safe and free from all

risk of explosion. These safes are strongly made of galvanised iron, and are supplied in three sizes, viz., to hold 10, 20, or 30 tins of petrol, each containing two gallons. In the event of any leakage, there is a spirit-tight well, below the level of the door, of sufficient capacity to hold all the spirit which may leak from any or all of the tins. The accessory is one which will be found useful by all interested in the safe storage of petrol.

WE learn by telegraph from New York that it has been decided that the race for the Vanderbilt Cup shall be run on Long Island in October, 1908. The conditions remain unchanged, except that ten cars will be allowed from each country, of which only three may be of the same make. The maximum weight has been fixed at 1,100 kilos.

ON the Brooklands Racing Track, on Saturday, F. Newton, driving a 60-h.p. Napier, created class records for the half-mile and ten laps (nearly twenty-seven miles) in the 60-h.p. class. The half-mile record was established at a speed of 96½ miles an hour. Some fast laps were made while the ten-lap record was being set up, and in two or three cases the speed exceeded ninety-four miles an hour. The official rate of speed, however, for the whole ten laps was just over eighty-six miles an hour.

THE new catalogue of Messrs. Benton and Stone, of Brackbridge Street, Birmingham, has a full list of the "Enots" specialities in pumps for motor-car tyres fitted with Taylor's locking arrangements securing the rod and handle rigidly in place when not in use; lubricators, pressure pumps, petrol filters, sparking plugs, &c. Since going to press with this an interesting improvement has been adopted in the lubricator, by which the ratchet thumb screws, spring and stock bar are dispensed with in the regulation of the drips.

THE Automobile Club of Philadelphia is arranging for the erection of signs on various cross roads inscribed with the words, "Blow your horn."

MR. F. K. HUSSEY has well-equipped motor works in Southgate Street, Gloucester, from which he conducts a hiring as well as a repairing business.

THE Sherburn Rural Council has passed a resolution in favour of the speed limit being reduced to twelve miles an hour in the country and six miles an hour in villages.

THE introduction of motor-cabs into Cairo is meeting with strong opposition on the part of the horse-cab drivers, so much that it has been necessary to call in the aid of soldiers to protect the garage.

It is reported that the Postmaster of the Presidency of Bombay is considering a scheme of replacing the horse-drawn postal delivery vans by motor-vehicles, and that he has already asked the Indian representatives of the leading British makers for particulars of suitable vehicles.

REPLYING to a letter from Mr. L. J. Martin, Pickering Place, London, the General Purposes Committee of the Worthing Town Council state that, subject to previous inspection and approval, they are prepared to recommend the granting of licences for a limited number of motor-boats to ply for hire, the boats to carry not more than twelve persons.

FROM Messrs. Welte and Owens, Ltd., we have received a couple of photographs showing interior and exterior views of their extensive garage and showrooms at 16, 18, and 20, Colquitt Street, Liverpool. As we mentioned in a recent issue, the firm are sole district agents for the Vulcan and Hotchkiss cars, while they hold a very large stock of motor accessories of all kinds.

MR. MERVYN O'GORMAN, chairman of the Expert and Technical Committee of the Royal Automobile Club, has offered a Challenge Trophy for a race of one hundred miles on the Brooklands track, for cars having engines which are not limited either as to dimensions, fuel allowances, quality of fuel, or method of propulsion, and no restriction to be placed on weight.

A MAN named John Blacklock, charged with driving a motor-car to the danger of the public in Newcastle-on-Tyne, pleaded that he could not have been travelling at even twelve miles an hour, as was alleged, as he had in the car a 24-stone giantess; her sister, weighing 10 stones; the manager, weighing 12 stones; a boy of 10 stones, and himself. Despite such an accumulated weight of evidence the Bench imposed a fine of 10s.

THE "Phos" Company, whose works are at 205 and 207, Ball's Pond Road, London, N., issue a well-illustrated catalogue of their specialities for acetylene lighting. One section is devoted to motor-car lamps, their "Phos" calcium carbide cartridge lamp being specially described. This will run for six hours with only one charge, and its simplicity of construction is proof against any disorder that might possibly arise. The Phos system of acetylene lighting for motor-omnibuses, coaches, &c., has been approved by the G.P.O. authorities, and is adopted in lighting the interior of the Royal Mail coaches. Here the firm's success has been distinctly notable.

AMONG the new tyres which may be expected to find a place on many cars in the coming season is the Calmon, which was introduced to the British trade at the recent Stanley Show. The fact that the makers, the Calmon Asbestos and Rubber Works, Ltd., of 1, 2, and 3, Trinity Place, Tower Hill, E.C., guarantee their tyres for 3,500 miles, if run under reasonable and fair conditions, is proof of a confidence that should encourage many motorists to give them a trial. The tyre has a square tread, with large rubber walls, and is ribbed on the extreme top, giving a non-skid surface and great durability on account of the weight of rubber used. A steel-studded tyre has the hardened steel studs fixed in the secondary tread, all being built in together with the walls of the tyre. The same firm has also brought out an automobile rubber overshoe known as the Chauffeur Boot. This is a well-made and neatly-designed means of protecting the driver from the wet. Its use gives him extra protection where generally wanted in severe weather, while his grip of the pedals is by no means lessened.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

TRAFFIC ON THE ROADS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—There seems a general impression that wherever the surface of a public road is at all cut up the motor is responsible for the mischief, but I would emphasise the appeal that is now being made by the Motor Union urging motorists to watch the wear and tear of the roads which arises from hauling agricultural wagons from fields to barns, &c. Much of this is quite unnecessary and could be avoided if the farmers would have the wheels of their wagons scraped before leaving the fields.

In some places the importance of this has been publicly urged, and the matter was discussed at the last meeting of the Chard Rural District Council, where unfortunately the members ultimately came to the conclusion that nothing could be done. A more serious view of the importance of the matter was taken by the Taunton Rural Council when several members pointed out the damage that had been done recently on main and district roads by agricultural wagons. Several practical members of the Council observed that they have generally waited for fine weather before doing their haulage work; this, of course, is not possible in all cases. Others said that the mud should be scraped from the wheels before the vehicles went on to the road, a course which was approved by the chairman, who raised the interesting point that bringing such mud on the roads might be considered extraordinary traffic, and that it might be possible for the Council to take proceedings against the owners of the vehicles.

You recently called attention to the increase of horse-drawn traffic in the area of the Holborn District Council as tending to show that motor vehicles were not by any means wholly responsible for the increased wear and tear of road surfaces in towns. This point with regard to the haulage of agricultural and other produce seems to be an

the latter car, bearing the official seal of the R.A.C., are on view at 87, Davies Street, and doubtless the parts of the "Silver Ghost" will also be exhibited to any one who cares to see them. It seems to me, therefore, that honours are easy, and that both cars have achieved a magnificent performance: any further attempt to belittle the record of either the one or the other car can but be harmful to both, and detract from the value of two certificates honestly and fairly earned, and both equally unequalled in the history of motoring up to the present time.

One word more. The only result of the voluminous correspondence on this subject has been that the Royal Automobile Club has officially notified both our firms that neither of us can claim the world's record for reliability. I trust that my friend Mr. Johnson will stay his hand and let the matter rest here, lest yet more be taken away from us!—Yours truly,

B. D. CORBET.

CARS FOR MODERATE MEANS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I paid a visit to the Olympia Show, and I must say I was disappointed at not finding more good 15 to 18 h.p. cars, with four cylinders, dual ignition, and gate change with four speeds at a moderate price. I regard the four speeds as very important (I live in Cornwall), for with this moderate power the first speed must be fairly low, and naturally the car, to be attractive, must be capable of a good pace on the top. The dual ignition gives one a feeling of security and saves stops on the road for adjustment, which are sure to come sooner or later with only one ignition.

I am aware that there were cars in the show built somewhat on the above lines, but, with one exception, the cost with hood, screen, lamps

The Motor Ambulance and Fire Tender recently supplied by the Argyll Company to the Sheffield Corporation.

almost identical one, and I am glad to see that the Motor Union is taking the matter up with considerable energy.—Yours truly,

A. WALKER.

[The point raised by our correspondent is not wholly a new one, and is being brought to the front just now by one of the motoring organisations. We shall be glad if readers in the provinces will keep us informed of any local discussions that may arise on the point in question, the subject being of considerable value as well as of interest.]

THE WORLD'S RECORD FOR RELIABILITY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice some further correspondence from Mr. Claude Johnson upon this vexed question; incidentally Mr. Johnson suggests that in the definition of "reliability" given by the R.A.C. some words have been omitted, "possibly through a clerical error." Let me assure him, as also those of your readers who may still have an interest in this matter, that there has been no omission—clerical or otherwise—in the quotation to which Mr. Johnson refers; should this gentleman care to call at the offices of the London and Parisian Motor Company, I shall be pleased to show him the letter in question, and on the same occasion endeavour to put an end to the unfortunate differences of opinion between us.

The whole question seems but a simple one, after all: the Rolls-Royce car ran 14,371 miles non-stop and the Hotchkiss 10,474 miles, but per contra a total of 40 hours 13 minutes was spent on adjustments to the "Silver Ghost," against a total of 9 hours, 44 minutes, 21 seconds spent in adjustments to the six-cylinder Hotchkiss. All the parts of

and spares would not be far short of £500. Now, although this may appear a moderate price from a seller's point of view, it is by no means so from a buyer's. The high-powered cars are certainly only for the rich, for the cost of running one per mile is about the same as that of running an express railway engine.

I think it a mistake to attribute the falling off in sales of cars to the wet summer, for people usually buy a car a few days before they want it, when the weather is an unknown quantity, and that the real cause is that the public are finding out from experience that cars are expensive in proportion to their capacity; and I am afraid that the trade will not have benefited much by the show just passed.—Yours truly,

F. R. L. CHALK.

A KNOCKING QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 12-16-h.p. Decauville four-cylinder car which has developed a severe knocking. I have gone over the usual formula. Cleaned deposits off piston ends and top of cylinders, cleaned plugs, no water in cylinder, fly wheel is not slack on shaft, &c. I have lately changed over to a new oil, and, thinking this was not suitable, I went back to the old make, but still the knocking continues. I purchased the car second-hand and have run it 3,500 miles without the slightest trouble. When the engine runs slowly there is no knocking, but when I open the accelerator the knocking begins. There is no governor on the engine or any projections that I can see; the big ends and the piston bearings are correct, being in every way in good order. One bearing in the gear-box is slightly worn, but the engine knocks with the clutch

out and each cylinder knocks when separately tried. I may say that the knocking gradually developed; it is not heard if I run the car or engine slowly, only when I open throttle or advance spark. The timing has not been interfered with. I am seldom at a loss with engine troubles but the above fairly puzzles me.—Yours truly,

BRAIN RACKED.

[Since our correspondent purchased his car second-hand, and has himself run it some distance, the cylinders are no doubt worn a bit; perhaps when he accelerates the pistons, reciprocating more rapidly and thus coming with greater impetus to the upper end of the worn part of the cylinder bores, cause a knock by touching the lesser worn part. The difference in diameter may not be sufficient to be termed a ridge round the walls, and may be almost imperceptible until accurately gauged; but it is nevertheless sometimes a cause of knocking in old engines—that is, of course, only in those in which the cylinders have not a clearance at the top of the bore, past which the upper part of the piston is allowed to reach on the completion of the up stroke.]

If the reason indicated does not apply in this instance, we should be inclined to suspect that a careful measurement of the gudgeon pins and journals will show that they have worn oval sufficiently to cause a knock when the motor is run at its full power. It is surprising what a very small amount of play will cause a knock in a high speed engine, or, at any rate, it surprises many who are not acquainted fully with the strict accuracy necessary in an absolutely perfect fit.—ED.]

POWER ABSORPTION BY PUMPS, MAGNETOS, &c.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In going round the recent show I was very much struck with the increasing work which the engine of petrol motor-cars is being called upon to perform. In the old days, apart from driving the vehicle,

A 28-h.p. Germain with Pullman Limousine Body.

the only auxiliary task set upon the motor was that of driving the water pump. Now we find that in some cars it has also to work the air inducing fan, the oil pump, the magneto, and, in addition, in a few other instances, an air pump for maintaining the petrol feed by pressure, and a dynamo for charging accumulators and starting the engine. It would be interesting to know if any experiments have been made with the view of ascertaining how much of the power developed by the engine is absorbed in driving these auxiliaries, which I fancy is much greater than is usually suspected. If any of the more technical readers of the *M.C.J.* have given attention to the matter perhaps they will send you the result of his enquiries.—Yours truly,

C. J. BENTLEY.

THE ACTION OF CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I thank Mr. Frank Smith for his reply to my letter. I do not see that his views accord with those of other authorities and present day practice. Have not the designers of carburetors arrived at such knowledge as will enable them to state definitely if a constant or variable quality of mixture is desirable for all engine speeds? The word "quantity" in the third line of Mr. Smith's letter should, of course, be "quality."

Let me quote Mr. Mervyn O'Gorman. In his paper on carburetors, read before the Institute of Automobile Engineers, Birmingham, he says, "Makers have begun to recognise that the desirable mixture is not of constant quality (2 per cent. by volume of vapour, as is still occasionally asserted) but should vary according to the quantity taken, the speed of the engine, and the power required at that speed."

I think the repeated success of the Talbot cars in hill-climbing contests is unparalleled by any other make of car, and I have seen it stated that their success is due to the additional air tap fitted to the induction pipe. I may say that I am in no way connected with the Talbot firm.—Yours truly,

SYDNEY WRIGHT.

LOCAL AUTHORITIES AND THE DESTRUCTION OF TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a constant reader of the *M.C.J.* I write asking if any of your readers can give advice in the following circumstance. Our town is a very hilly place, and only lately the Corporation have thrown down ashes in the streets, which are paved with asphalt to prevent the horses from slipping. Now they are throwing down small sharp stones, which punish the tyres of my motor-car terribly. I use my vehicle to do my work as a medical man, and would like to know if I have any redress in such circumstances. Will motorists who have suffered in a similar way kindly inform me if they have been able to obtain any redress?—Yours truly,

DR. A. C.—.

[The nuisance referred to by our correspondent was often a source of annoyance to motorists in West End boroughs three or four years ago. But now and again it occurs and representations should be made to the local authorities by the local automobile club, or, when such does not exist, by the county organisation.]

LEATHER FOR FRICTION CLUTCHES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any reader of the *M.C.J.* could inform me as to the right kind of leather to use for the friction clutch of a motor. I should also like to know whether in removing the clutch for the purpose of renewing the leather it is necessary to use clamps to overcome the spring!—Yours truly,

R. MITCHELL.

[The best leather for clutches is such as is used by harness makers, this being more pliable than that employed by shoemakers. For the shape it is best to first cut a paper pattern, allowing enough on the width for trueing up. The rivets must be let in the leather so as not to come in contact with the metal portion of the clutch. It is also advisable to turn up the leather after it is riveted on. For removing the clutch it is generally necessary to take down the gear-box, no clamps being used. The re-leathering cannot be done satisfactorily with the clutch in position.]

ENGINE STARTING DIFFICULTIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a two-seated car fitted with a 6-h.p. De Dion engine and carburettor. The motor has run very well for a thousand miles or so, but now I have the utmost difficulty in starting it. The only way I can get it to go is by putting petrol in at the sparking plug, then it will start off at a furious rate, although I cannot regulate it. The compression and everything appear all right. My idea is that the carburettor has gone wrong. I have had it out on several occasions, but it appears in good order. I should be much obliged if you could advise me on the matter.—Yours truly,

W. J. FLOCKTON.

[Our correspondent's difficulty is, in all probability, due to a slight sticking of the inlet valve; this would cause great difficulty in starting, although, once started, the motor would run all right. If this were the cause, it would be impossible to get good suction by turning the starting handle, as it is not possible to turn this quickly enough to overcome the sticking.]

MORE ENGINE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could help me in the following trouble. I have an 8-h.p. single-cylinder car; when the vehicle is at a standstill the motor will run smoothly and without a miss, but when it is in motion the engine misses and causes a knocking noise, the car jumping ahead at every explosion. I have tried everything I can think of—new plugs, batteries, &c., and when I test the ignition I get a good spark. I do not know what the trouble is. The car, when running, will not run more than five or six revolutions without a jumping motion.—Yours truly,

R. FOTHERGILL.

[THE misfiring trouble may be due to the contact breaker not giving good contact, or perhaps the spindle is worn somewhat and making the earth circuit bad; this would cause similar trouble as explained by our correspondent, the road vibration causing the spindle to work out of true. Failing this, the carburettor may be carefully examined, trouble of this kind sometimes arising from a bad petrol supply or the jet being slightly choked.]

A HUMBER wheel cap has been discovered near Messrs. Brown and Co.'s garage, Yeoman's Row, Brompton Road, London, S.W., and can be had on application to that address.

THE OLYMPIA SHOW.

(Concluded from page 884.)

Motor Accessories.

Very comprehensive was the collection of motor accessories shown by Messrs. BRANSOM, KENT AND COMPANY, 40, Great Eastern Street, E.C. The selection of horns was large, and included many new models with musical and yet penetrating notes, lamps, tools, lubricators and tyre levers. A distinctly good type of tyre pump was shown by the firm, this being the Aeolus telescopic type, which is reliable, efficient, lasting and strong. The principle is explained by the word telescopic, and as every part is accurately machined it can be thoroughly relied on. Goggles, insulated wires and terminals, and lamps of every description were also shown, as well as a good range of sparking plugs, these including the "Darap," "Optima" and "Bo Ko."

Simms Specialities.

On the stand of the SIMMS MANUFACTURING COMPANY, LTD., Welbeck Works, Kimberley Road, Kilburn, were several working models of high-tension magnetos for two to six cylinder cars, as well as a comprehensive range of "Simms" magnetos of British manufacture. The new Simms magneto sparking plug was on view, this being suitable for use with any high tension magnetos and for accumulator and coil ignition. The new plug is strongly made and highly finished, and the material used for insulation is specially made for this purpose, being extremely tough and of high insulating properties. This plug does not soot up or burn away, and any adjustment of the points required from time to time can be made in a moment without the slightest difficulty. The body

slightly more power at all speeds, and that the engine will run up to a very high speed and pull at a very low one with this form of ignition. The igniter is mounted in a mahogany case well adapted for the dashboard, and either 4 or 6-volt batteries may be used without risk of breakdown. In the lid is a window, through which the spark is visible, this occurring simultaneously with that in the cylinder.

The "Ajax" Rims.

On the stand of the MIDLAND RUBBER COMPANY, LTD., of Ryland Street, Birmingham, was a collection of the "Midland" motor tyres of both the plain and grooved variety, as well as a good display of repaired and retreaded tyres and covers and tubes. A novelty of more than ordinary interest was the "Ajax" detachable rim, which was on the stand. The rim and tyre can be exchanged in three minutes, and the "Ajax" principle can be easily applied to existing wheels. The ordinary wood motor wheel is fitted with a light steel felloe into which three keyways have been cut. The detachable rim has three corresponding keys (or projections) on its inner side. These three keys and keyways fitting exactly, in addition to preventing any creeping movement, act as a stop in pushing the rim on to the wheel. The rim has a flange on its outer edge drilled with three holes which fit on to three corresponding bolts fitted into, and projecting from the wood felloe; it is then secured by three fly nuts. The three fly nuts on the side of the wheel are taken off, and the tyre and rim is then slipped off bodily, the fresh tyre and rim is slipped into place (the projecting bolts acting as a guide into its right position), the keys and keyways engaging automatically, the three fly nuts are screwed up, and all is then ready for the road. It will thus be seen that no tools are necessary, while the fact that there

Fig. 136.—Elevation of Chassis of Darracq 18-h.p. (See page 808, November 16th issue.)

and locknut of the Simms magneto plug are constructed of hardened steel, thus preventing any unsightly burring over, or the slipping of spanners. The central pin is made of special nickel steel. It may be pointed out that the magnetos of the company are now known as Simms magnetos, the title formerly used having been disposed of.

The Lodge Igniter.

The new Lodge motor-car igniter, which was shown for the first time by Messrs. LODGE BROS. AND CO., of 14, New Street, Birmingham, attracted considerable attention. The Lodge is the invention of Sir Oliver Lodge, and its application to motor-cars is the result of experiments extending over three years. It is applied in precisely the same way as the ordinary high-tension trembler coil, viz., with single coil, battery, and high-tension distributor for multi-cylinder engines. A notable igniting spark is furnished, and one that, as was demonstrated daily, is unaffected by any such common causes of trouble as damp or sooty plugs. Water and oil on the sparking plug have no effect upon the spark; and it was shown that the spark will occur even when the plug was wholly immersed in water. No more current is consumed than is taken by the ordinary trembler coil. The practical effects of the Lodge igniter are due wholly to the impulsive character of the high-frequency "B spark." This is produced by special glass condensers, or Leyden jars, in the secondary circuit, which are charged up, overflow, and precipitate across the gap provided at the sparking plug an instantaneous surge of current of great potential and energy. Obstructions in its path are carried away, and the combustible vapour instantly ignited. The intensity and vigour of the spark from the Lodge igniter was remarkable, and it is said that in practice a motor-car engine using this ignition develops

is no strain on the axle and that the only alteration required to existing wheels is the fitting of a light steel felloe on the top of the existing wooden one adds to its merits.

Sumner's Wind Screen.

One of the most ingenious wind screens in the Exhibition was that of Messrs. Sumners, shown on the stand of Messrs. PANHARD AND LEVASSOR in the Gallery. It consists of the usual two sheets of glass in frames, constituting the top and bottom halves of the device. These are easily adjustable at any angle and can be fixed by the simple operation of turning one fly nut. The screen can be brought into action while the car is travelling, by the passenger sitting by the driver, and safely secured without any risk. There is a complete range of adjustment. The top part can be brought near to the eyes and raked backwards to avoid reflections—a position which secures comfort to the eyes as well as the maximum protection from dust, wind, and rain. Fixed to the frame of the car is a stay rod which takes the strain, relieving the dashboard of the pressure usually associated with such devices. Besides being extremely simple so far as attachment is concerned, there is a notable rigidity about the screen and absence of rattle which adds to the favour with which Sumners' wind screen has been received. In this Messrs. Panhard and Levassor have secured a popular accessory to the car.

White and Poppe Engines.

Messrs. WHITE AND POPPE, LTD., were represented by their engines and carburettors. The four-cylinder engine of 80 mm. by 90 mm. dimension was shown with full equipment, including the Simms-Bosch high-tension magneto. In this, each cylinder is cast separately, and large

valves are a feature of the motor. It is readily accessible, the contact maker and water-circulating pump being easily dismantled. Carefully designed with a view to secure silent running, the new White and Poppe engine should have a distinct success. A four-cylinder engine 120 mm. by 130 mm., with magneto ignition, and another with the valves all on one side, were also shown. This latter is of 110 mm. bore by 110 mm. stroke, and special attention has been paid to economising space. By the valves being placed upon one side of the cylinder only, more space is given in the chassis for the steering column and ignition gear. The engine is supplied with carburettor ready fitted, and in a position which will be found to clear all parts of the chassis. The pump and ignition gear, including magneto, form a separate unit, which is detachable by the removal of four nuts only, and each separate detail is also readily detachable. The lubrication is by splash through the timing gears chamber, which is constructed so that the gears themselves circulate the oil in the crank chamber.

The Parsons Non-Skid.

A new point in the PARSONS non-skid for the coming season consists in the improved Grippa principle. The non-skid is now made with one endless chain side hoop and one divided in two places and fastened with coupling. This considerably facilitates the attachment or detachment of the device. The principal feature of the improved type is the substitution of chain for wire in the side hoops. It has been found after careful experiment that the chain is to be relied upon for strength, indeed it has the advantage over wire in this respect, as it is not affected and weakened by rust. It is quite easy to shorten the chains should the non-skid be a little too large, and they are sent out when new with the outer hoop chain a little too long, to meet the case of re-treaded or extra size tyres. The

— Fig. 137.—Smith's Speedometer. (See page 846, November 23rd issue.)

method of attaching the cross chains to the hoops with soft wire connecting hooks is certainly simpler and less troublesome than the original attachment with clip and split pin. The chains being shorter are consequently lighter, and renewal chains are supplied at a proportionately reduced cost.

The Bleriot Headlight.

The features of the Bleriot "Noglar" headlight have become familiar to those motorists who are frequently on the road, and have been greatly appreciated by those who combine tour and country travel. On previous occasions we have detailed the method by which the lamp shade is rendered reliably automatic in its action, obviating the constant care on the part of the driver which is a constant source of irritation with many other lamps. The full light is projected by the lamp right ahead and on the road in front of the car where it is required, but the high-rising rays of light are all cut off. And as our readers know, these are the rays which constitute a nuisance to other users of the road. In addition to these, Messrs. BLERIOT, LTD., who are well represented by Mr. Norman Chereau, showed the improved Parabolique headlights and the lenticular projector. The Autoelectric arrived late at the exhibition, and details of its many excellent features are reserved till a later occasion.

H.F. Vulcanisers.

The King of Spain was interested in the H.F. system of vulcanisation and made a full inspection of the little "Car" vulcaniser on the stand of Messrs. HARVEY FROST AND COMPANY, LTD., where were also shown the many excellent devices they have introduced for the benefit of motorists. Their H.F. vulcaniser has obtained wide popularity. It consists of a steam generator, the heat being transmitted to the part under treatment by the outer surface of the generator, which is adaptable to the outer cover or inner tube (as the case may be) under treat-

ment. The steam is quickly raised by means of a methylated spirit burner, while the adoption of a safety valve ensures users against accidents. The other fittings are, briefly, a filling plug, water level gauge, tube press, and special chain attachment for dealing with cover repairs *in situ* on the wheel.

Stepney Spare Wheel.

At practically all the car stands in the main hall the Stepney spare wheel was shown fitted, proving its universal acceptance by the automobile world. The exhibit entirely devoted to this useful accessory in the Gallery comprised specimens of the spare wheel for ordinary motor vehicles with equal wheel and attached with an improved leather spoke strap, and also of the combination "Stepney" wheels for automobiles of large size, where the tyres on the front and back wheels are of different sizes. These are fitted with four expanding or contracting clips by means of which the wheel is adaptable for use on either the front or back wheels. The accessories exhibited in connection with the Stepney wheel comprised ring carriers and brackets to secure the wheel to the driver's side of the car when not in service; a sun-proof cover for the protection of the tyre and a mudguard extension for preventing the splashing of mud when the Stepney wheel is in use.

Jenatzy Tyres.

In the Gallery Messrs. H. M. HOBSON, LTD., 29, Vauxhall Bridge Road, S.W., showed the Jenatzy tyre and non-skid covers. Resilience, strength and durability are combined in this tyre, the use of various rubbers and special fabrics in building up the tyre contributing to this end. The fabric composing the tyre is woven under a special process, the threads themselves being coated with rubber, giving strength and resilience to the casing. The walls of the tyre are composed of soft black rubber, securing pliability. The beaded edge is composed of a specially prepared tough rubber, and altogether the tyre is one of notable merits. At this stand, too, were shown the Jenatzy-Houben non-skidding covers, the special feature being a patent tread composed of alternate steel and leather rivets.

The Kempshall Tyre.

Among the exhibits to be seen on the stand of Messrs. CHAS. MACINTOSH AND CO., LTD., was the Kempshall non-skid pneumatic tyre, which is claimed to have distinctive features in its absolute freedom from skidding propensities and the great resiliency secured. It was recently tried on a 40-h.p. Fiat running continuously for three hours at a speed of 60 m.p.h. on the Brooklands track, and at the conclusion of the run was found to have developed no heat. The characteristic feature of the Kempshall tyre is the series of circular indentations around the tread. This system gives great adhesion on greasy surfaces, and is destructive of any skidding tendencies which might otherwise be developed. It is claimed to give increased speed, durability and resiliency and generally add to the efficiency of the tyre.

Fafnir Components.

Messrs. G. STRAUS AND CO., LTD., made a good show of Fafnir motor components, notably of the 8-h.p., 15-h.p., and 24-h.p. sets as well as the 16-h.p. motor. These combine power with lightness, and the engine parts, which are standardised, are thoroughly accessible. The Fafnir engines have a crankshaft of the finest grade steel. At the clutch end of the crank case are two ball bearings to compensate for any thrust on the engine shaft or gear-box. Mechanical valves are fitted. The water circulating pump is easily detachable, this being a pump of ample capacity. The various sets are well designed, and those who are interested in the production of touring cars or commercial vehicles were greatly interested in the display.

U. M. I.

Several of the novelties exhibited by the UNITED MOTOR INDUSTRIES, LTD., have been described in other columns, and here it will suffice to say that the display made by the firm included a full range of their "Castle" motor specialities, such as coils, carburettors, jacks, horns, indicators, lamps, &c., as well as the Wagner electric horn, some good types of pneumatic jacks, &c., and the Dubrule lubricators and Eisemann magnetos. The Mero gear described and illustrated in our columns on the 9th ult. was also on view, as well as the Warren pneumatic jack. By means of the latter device a weight of 2½ cwt. can be lifted without any difficulty.

The "Avon" non-skid.

At the stand of the AVON INDIA RUBBER COMPANY, LTD., was a good selection of covers, treads, gaiters and other specialities in connection with motor tyres. The "Avon" non-skid motor-tyres are deserving of mention. These consist of hardened steel studs securely riveted into a tread of rubber and fabric and vulcanised to the tyre casing under steam pressure. Between the base of the studs and the casing a layer of fabric and canvas is vulcanised to prevent the studs from injuring the casing. Thus the risk of danger is obviated and a capital device secured.

Imperial Tyres.

A good display was made by the IMPERIAL TYRE COMPANY, LTD., of Eagle Wharf Road, London, N., whose West End depot is at 228,

Shaftesbury Avenue, W.C. The Imperial motor tyres are made of the grooved flat type as well as the plain round pattern. An interesting type is that with the arrow tread. A neat and effective non-skid band with steel studs is a speciality of the company, which also undertakes the retreading and repair of tyres by an improved process of their own. Tyre levers, garters and general tyre sundries were also among the exhibits on this stand. The Imperial Company have a department for executive experimental work for inventors and others interested in tyres for motor cars.

Electrical Accessories.

Messrs. PETO AND RADFORD, LTD., had a good show of armoured accumulators for ignition and lighting, "Viaduct" coils and other specialities. They have their own accumulator factory at Ashted, Surrey, where repairs to accumulators of all types are undertaken. Electrical measuring instruments, dynamos, charging boards, &c., were also part of the exhibit. The new switch-boards are self-contained, with regulating resistance instruments and two-pole switches complete. The interior lighting of cars has also received attention from this firm, which keeps well to the front in electrical work.

Cann's Carriage Work.

Specimens of most effective carriage work were shown by Messrs. CANN, LTD., 12-14, Miller Street, Camden Town, N.W., on "White steam" chassis. The exterior of all the vehicles on view was highly finished, and the general outlines indicated an artistic appreciation as well as sound workmanship. The 30-h.p. White limousine with a fixed top was a good type of work. The body is fitted with folding side pillars, which are folded into the roof, making the sides quite open—altogether a roomy and comfortable vehicle for touring as well as for town use. The exhibit generally was greatly admired for its artistic effect as well as excellence of work.

The Sirdar Company.

An attractive exhibit was that of the SIRDAR RUBBER COMPANY, whose special grooved, studded, and plain tyres have long ago won the favour of motorists. By the adoption of the patent Royal Sirdar non-nipping tubes the motorist can minimise his tyre troubles. The company is also undertaking repairs and making a special feature of the retreading of motor beaded-edge covers.

Bell's Wind Screen.

Mr. C. E. BELL, of the Stanley Works, Paisley, showed on one of the stands in the main hall his new wind screen, which can be easily adjusted to almost any position on the car. The screen is particularly serviceable for use with a Cape cart hood and affords perfect protection in all weathers. All adjustments are made from the driving seat and there are no binding screws to work loose.

The Gaulois Tyre.

The Gaulois tyre was shown on the stand of the GAULOIS TYRES, LTD., who also drew attention to the Gaulois Forre non-skid cover, in which the hardened steel rivets are carried in washers which are set in the outer tread of the cover itself. This is one of the latest innovations in armour protected covers, and naturally drew many visitors to the stand.

Miscellaneous.

Messrs. GAUTHIER AND COMPANY, 8, Great Marlborough Street, W., exhibited several of the M.A.B. specialities, including a "gate" change gear with four speeds and reverse, suitable for a 30-h.p. car, and a specimen of the live axles used on motor-cabs in the metropolis. Levers, back axles, carburettors, &c., were also included in the display. Included among the exhibits were the T. and M. multiple-jet carburettors, which give a correct mixture of constant proportions of petrol and air, whatever be the speed of the engine.

Good workmanship was the dominant note of the exhibits on the stand occupied by the COVENTRY MOTOR FITTINGS COMPANY, of Far Gosford Street, Coventry. The stand included radiators both of the genuine honeycomb and also the C.M.F. patent imitation honeycomb types; bonnets, silencers, lubricators of every variety, lubricator racks, gauges, ball joints, unions, &c.

The "Samson" plain treads and studded tyres were on view at the stand of the SAMSON LEATHER TREADS AND TYRE COMPANY, LTD., of New Burlington Street, W., a concern that also undertakes the execution of repairs to all classes of covers and tubes. These special non-skids have long been before the motoring public and are well sustaining their reputation.

Messrs. PANHARD AND LEVASSOR had a good selection of parts, &c., in the Gallery, where they also showed Sumners' wind screen, referred to elsewhere, and Mackie's patent car electric lighting and ignition system.

Mr. E. H. JONES showed examples of his specialities in Cape cart hoods, wind screens, &c., and similar work, all marked by a good distinctive style and having features of interest. A wind screen which can be easily set at any angle was shown.

The idea of detachable bodies, enabling one chassis to do service in two or more capacities, has often been regarded as a desirable thing, but until the WINDHAM SLIDING DETACHABLE MOTOR BODY COMPANY

brought out its notion few realised the real value of the plan. Now it has been satisfactorily demonstrated it is proving popular. It was shown at the exhibition in connection with a 30-h.p. six-cylinder Napier with a Roi des Belges side-entrance phaeton. By the Windham's detachable and interchangeable system the body slides on or off the frame of the chassis and when taken quite apart is supported on four legs fitted with castors. Not only is the exchange of bodies quickly effected, but there is no rattle when attached and the self-locking arrangement gives every security.

At the stand of the COVENTRY CHAIN COMPANY (1907), LTD., visitors were shown the company's specialities in automobile chains, chain wheels, &c. The exhibits also included chain repair tool sets and the well known chain lubrication bath. Chief interest, however, centred in the silent running chain, the Coventry Wormo Roller, recently referred to in our columns.

Messrs. BRAMPTON BROS., LTD., were again represented at Olympia with a complete selection of their motor chains. These are so generally known that it will here suffice to say that the firm is now making a special feature of those of 36 mm. pitch by 16 mm. wide, the roller being of 16 mm. diameter. The breaking strain of this chain which weighs 21 oz. to the foot is no less than 10,000 lb.

THE RELIANCE MANUFACTURING COMPANY, of 19, Milton Street, Lower Broughton, Manchester, had a display of the radiators bearing their name. Although light in weight, they are of strong construction and give a large cooling area. The tubes are made so as to require no solder or other filling medium in the vertical joints. Other specialities of the company include condensers, bonnets, tanks, silencers, wings, &c.

"Shell" motor spirit is kept to the fore by the GENERAL PETROLEUM COMPANY, LTD., who took this opportunity of familiarising the motoring public with the various packages by which it is transported in the United Kingdom. The many successes of the "Shell" spirit have made its merits generally recognised.

The "Arcelite" motor head lamp was to be seen on the stand of Messrs. H. MILLER AND CO., LTD. In the new pattern for 1908 some important points have been incorporated. A new generator has also been introduced, so that the water and carbide can be left for an indefinite time without wastage. In addition to a full range of their motor lamps the firm also showed a wide selection of motor horns fitted with dust screens in a way that prevents their being shaken off by vibration.

A good selection of carriage-builders' ironmongery and brasswork was shown by Messrs. FREDERIC SELBY AND CO., LTD., who have long been known as makers of motor-car axles, springs and ironwork, landaulet fittings, Cape hood joints and wind shield fittings. Their specialities included the new "Longmore" revolving seat, and a front steering axle with pivot arms for ball bearing hubs, with steering arms and connecting rod complete, suitable for a 16-20-h.p. car.

Messrs. E. AND H. HORA, LTD., had good examples of their motor body work, including a limousine landaulet to seat five passengers inside, the fauteuil spring seats being a capital feature; the seats fold back out of sight when not in use. A square-fronted car with similarly-designed body and an open "Roi des Belges" touring car with the firm's double extension Cape cart hood were also shown.

Messrs. W. H. WILLCOX AND CO., LTD., made a special feature of their oils and greases, which under actual running conditions have given good and economical results on all makes of cars. Their motor lubricants of the "Atlas" brand are of heavy, medium and soft consistencies for various purposes, and for electric and steam vehicles a special oil has been prepared. Motor pumps, lubricators, joints, packing and general engineering sundries were also exhibited.

MESSRS. T. F. BRAIME AND CO., LTD., are specialising in pressed steel brake drums for motor-cars, and are making a seamless steel oil can for use on motor vehicles. Their works are in Goodman Street, Hunslet, Leeds.

A CATALOGUE of the accessories for 1908 has been issued by the United Motor Industries, Ltd., whose association with the automobile industry dates from very early days. In addition to the "Castle" proprietary articles the firm are sole British agents for many well-known accessories, including the Dubrulle lubricators, the Dupressoir components, Hannoyer springs, Wagner electric horn, &c. The firm have also issued a pamphlet entitled "All about Castle Coils and Accumulators," by Mr. S. J. Watson, which will be of great service to all users of the reliable accessories.

A CONFERENCE of delegates representing various London trade unions of drivers of different kinds of vehicles has been taking into consideration the means whereby London's ever-increasing vehicular traffic can be better facilitated. A resolution was passed suggesting, with a view to preventing blockages and street accidents, that all walking teams and slow-going vehicles should, as far as possible, keep to the near side, thus giving trotting teams, cabs, trams, and quick-moving vehicles a better opportunity to get through the traffic. A generous give-and-take policy among drivers was recommended.

ALCOHOL AS A FUEL FOR AUTOMOBILE MOTORS.*

BY THOMAS L. WHITE.

IN considering the possibilities of alcohol as a fuel for automobile motors, it is impossible to avoid alluding, however briefly, to the economic conditions which must eventually determine its use as a fuel at all, and this independently of all technical considerations. Petrol is the by-product of a geographically limited and monopolistically controlled industry, and there are reasons to believe that the available supply is more than mortgaged by a world-wide and growing demand. Alcohol is, one might say, the product of the four seasons. It can be manufactured from any vegetable substance which contains sugar or some material like starch, which is easily convertible into sugar. As to available supply, it can be and will be produced in unlimited quantities at a steadily diminishing cost. From corn-cobs it has already been experimentally prepared at less than 3d. a gallon, and there seems little reason to doubt that if the technical problems connected with its use can only be solved, and if, also, what is important at the present moment, its use can be reduced to current practice; if, in other words, some means can be devised of economically burning this fuel in the thousands of automobile motors in existence to-day, there is little doubt that the demand so created will be satisfactorily met, both as to quality, quantity and price.

Passing now to the question of denaturing, it is gratifying to see that the authorities in the United States have yielded to the pressure brought

rate of the motor alcohol is sluggish compared to petrol. (3) Alcohol containing ten per cent. of water is capable of very high compression (150 pounds upward) without pre-ignition. (4) Alcohol in the process of inflammation does not radiate heat so rapidly as petrol. (5) Expectation to the contrary, alcohol is most efficient as a fuel when the wall of the cylinder is maintained at a temperature of about 200 deg. Fahr. (6) When alcohol is used as a fuel the penalty of incomplete combustion is not merely loss of efficiency in the motor, but the corrosion and destruction of valves and other exposed parts due to the production of acetic acid, formaldehyde, and other deleterious compounds.

It is a well-known fact that the efficiency of an Otto cycle is a function of the compression ratio. It follows that in motors specially constructed for alcohol we should expect a very high thermal efficiency, and this expectation is borne out in practice. With the Deutz motor using a nine to one compression a thermal efficiency of over thirty-one per cent. has been obtained, which shares with the Diesel the distinction of being the high-water mark of efficiency for explosion engines. In the case of the automobile motor, however, the problem is to accept the compression ratio as a datum and to seek efficiency in other directions. This essentially means that the use of alcohol under such conditions is a carburation problem.

Speaking generally of alcohol motors, carburation practice falls naturally into two divisions. (1) Motors, like the Deutz, which have a high compression and in which the alcohol is simply sprayed into the ingoing air just as it enters the cylinder, the hot cylinder walls and the heat generated by compression being relied on to complete the vaporization. (2) Motors, like the Dürr, in which the compression ratio is moderate, say six to one, and in which a superheated mixture of air

The Fleet of Electrobus at present in Service in London.

to bear on them, and have reduced the quantity of added methylene from ten to two per cent. This, however, is only a step in the right direction. When the use of alcohol in motors becomes more general, I think that the motor industry will be entitled to demand the same special consideration in the matter of a suitable denaturant as is now accorded to the chloroform, vinegar, ether, and other industries where the selection of a denaturant suitable to the needs of the case is permitted. So far as the motor industry is concerned something like this is already in force in Germany and Austria, where motor alcohol is distinguished from domestic alcohol, that is, alcohol for general purposes of heat, light, and fuel. If I might make a suggestion, I think that the revenue would be sufficiently safeguarded if alcohol destined for use in motors was saturated with acetylene gas with possibly the addition of a little acetone to facilitate its solution. Methylene as a denaturant has the one commanding advantage in the eyes of the revenue officials, that by no means known to science can it be separated from ethyl alcohol. In the motor, however, it is a disadvantage in every way. Its action is corrosive, its calorific value is low and it is costly. The less of it the better. If alcohol must be nasty, let it, at any rate, be cheap.

Coming now to the main subject of this paper, namely, the use of alcohol in existing motors working with a compression of four to one, or thereabouts, whose r.p.m. rate is high, it is as well to briefly review, even at the risk of being considered trite, the essential facts with which we have to deal. They are: (1) Alcohol calls for six per cent. of its calorific value to completely evaporate it. (2) With ordinary compression the inflammation

and alcohol vapour is produced by exhaust-heated baffle-plates situated in the carburettor itself. In both cases the motor cannot be started by hand. In the first case, because the hand compression is not rapid enough to evaporate the atomized charge in the cylinder; in the second case, because there is a precipitation of the volatilized alcohol on the cold cylinder walls. In efficiency tests these two types come out about level. Thus in the Dürr motor the perfect carburation offsets the lower weight of the mixture and the lower compression ratio, while in the Deutz motor the thermal gain due to greater compression is qualified by the fact that the evaporation in the cylinder is never complete and consequently part of the fuel is wasted thermally by being burnt late in the stroke or not at all. It is clear that in automobile practice we must seek something in the line of complete carburation, even at the expense of reduced charge weight, so that in order to produce efficiency under existing conditions of motor construction we must aim at:—(1) Perfection carburation with the aid of the exhaust heat. (2) The acceleration of the rate of inflammation in the cylinder. (3) The maintenance of the cylinder walls at a temperature of about 200 deg. Fahr.

Passing to the actual phenomenon of combustion in the cylinder itself, it would seem that the slow inflammation rate of a mixture of alcohol vapour and air is a necessary corollary of the fact that such a mixture is susceptible of a high degree of compression without spontaneous ignition. It is, I think, now a recognised fact that when an inflammable mixture is ignited by a spark the propagation of the explosion is not due to direct consecutive ignition throughout the body of the gaseous mass, but to the successive compression to the self-ignition point of layers of gas immediately enclosing the inflamed nucleus at the moment considered. Now, if petrol and air be ignited, the shell

* Abstract of paper read before the American Society of Automobile Engineers.

of gas surrounding the explosion focus has only to be compressed about five to one to spontaneously ignite throughout its extent. In the case of alcohol a much higher compression is necessary, so that the explosion acceleration is necessarily slower. All commercial denatured alcohol contains 10 per cent. of water, and the function of this water in the alcohol motor is practically an undetermined problem. There is reason to believe that the corrosive action so much complained of in alcohol motors is partly due to its presence, and it undoubtedly has something to do with the high compression ratio. Of course, it is known that the presence of water in an inflammable mixture in a motor is not altogether a disadvantage. In the first place, combustion in the absolute absence of water is impossible. Thus phosphorus absolutely refuses to burn in pure oxygen. Then, again, we have the experiments of Banki and others, who have deliberately injected water into the cylinder during the compression stroke with a resulting increase of efficiency in the motor. I have not seen records of any experiments made with absolutely pure alcohol, but they would be decidedly interesting, if only as a guide. It is, however, generally believed that alcohol containing water is the better fuel.

In an address delivered last year, Dugald Clerk showed that the development of the stationary motor shows a decrease of the heat loss into the water jacket and an increase of the heat loss into the exhaust. Indeed, what has been gained by the swings seems to have been lost on the roundabouts. Owing to its low radiative quality alcohol comes naturally into line with this tendency in modern practice. In fact, were it not for the necessity of maintaining a high cylinder wall temperature, the question of cooling an alcohol motor would be a simpler one than in the case of petrol, as the actual amount of heat to be dealt with is less. With regard to the chemical reactions which take place in an alcohol motor, there seems to be much doubt and much difference of opinion. Thus, while on one hand we find Sorel, the French expert, attaching the greatest importance to the erosive effort of acetic acid formed by incomplete combustion, we have Fehrmann, the German expert, denying the existence of acetic acid altogether. Be this as it may, it seems to be a definitely ascertained fact that when the carburation is incomplete, pitting of the inlet valve seat and the formation of an incrustation upon it result. As to what excess of air should be present seems largely to depend on the r.p.m. rate, and in this connection it should be remembered that the record efficiencies for the use of alcohol for motors have all been attained with a low speed, in some cases as low as 200 revs.

One of the most mysterious phenomena of the explosion motor is heat suppression, or the addition of heat during the expansion stroke, so that the expansion curve remains above the adiabatic drawn between the same limits in spite of the fact that heat has been radiated all the time. The suppressed heat in case of alcohol is, according to Sorel, greater than with a gas engine. So far as a comparison with petrol is concerned, the advantage appears to be slightly with alcohol.

It is now with some diffidence that I come to mention an attempted solution of the carburation question due to Mr. Barker and myself. The two objects of our device are to carburet air with alcohol instantly and completely and to promote approximately instant inflammation at minimum compression in the motor. What we propose to do is to pass air containing partly atomized and partly vaporized alcohol through a layer of calcium carbide before such air enters the cylinder. A portion of the 10 per cent. of water in the alcohol is taken up by the carbide and replaced by acetylene gas, and the heat of this reaction simultaneously vaporises the alcohol. From the nature of its formation such a mixture of acetylene, alcohol vapour and air must necessarily be a very intimate one. In the cylinder we consequently have:—(1) A well-diffused mixture. (2) An endothermic compound in the form of acetylene, which contains heat over and above its thermal value and which spontaneously ignites at comparatively low pressures, so that when the mixture is fired the pressure set up round the sparking plug causes the practically simultaneous detonation of the acetylene throughout the body of the alcohol.

Taking into consideration that the substitution of acetylene for water is a net gain calorifically, and that the elimination of this water will probably do away with much of the erosion complained of in alcohol motors, we hope to produce for the ordinary automobile motor an alcohol-air-acetylene charge, whose characteristics thermally are not very different from those of a mixture of petrol and air.

There is an impression in some quarters that alcohol has to some extent received a set back in Europe. It would probably be more correct to say that, while with slow-going motors it has proved a great success, the development and perfection of the automobile motor have left little leisure to designers to study the alcohol problem with any thoroughness. In fact, it is more or less virgin forest, which the automobile engineer has to clear when he is dealing with the question of alcohol motors.

FOR the information of those motor-car firms who are developing export business Messrs. Davis, Turner and Co., Ltd., 52, Lime Street, E.C., have issued a freight list giving the duty required in the various countries on the Continent and colonies of the empire together with the cost of cartage in London.

THE CENTURY MOTOR COMPANY, LTD., of Holland Gate, Kensington High Street, London, W., inform us that the statement that they are introducing a new French-built car known as the Weyher-Richmond is incorrect; they have no intention of handling this vehicle, nor have they been approached on the matter.

CLUBS AND ASSOCIATIONS.

THE MOTOR UNION.

THE Motor Union, whose new badge is now ready, has provided at the offices, 1, Albemarle Street, Piccadilly, W., a room for the convenience of the members, and, at the suggestion of Mr. C. D. Rose, the chairman, this has been newly decorated and comfortably furnished. The current motor literature and a complete set of maps of the United Kingdom will be found in the apartment. Provincial members visiting London may have their correspondence addressed to them, care of the Motor Union offices, and writing materials will enable them to deal with it immediately. Afternoon tea will also be obtainable.

AUTOMOBILE ASSOCIATION.

THE enterprise of the Automobile Association, which, in conjunction with the Motor Club, furnished a room at the Salon des Automobiles, Paris, for the convenience of members, was greatly appreciated. Considerable interest was also evinced by foreign motoring enthusiasts in the work of the A.A., and this was carefully explained by the attendant in various languages.

AERO.

MR. R. W. WALLACE, K.C., presided at the annual dinner of the Aero Club at the Savoy Hotel, London, last week, being supported by about a hundred guests. The royal toasts having been duly honoured, that of "The prosperity of the Aero Club" was proposed by Lord Montagu and responded to by the Chairman. Vice-Admiral Sir Charles Campbell proposed the toast of the visitors, on whose behalf Baron Henri Deutch de la Meurthe responded.

NORTHAMPTONSHIRE.

A MEETING of the committee of the Northamptonshire A.C. was held at the George Hotel, Northampton, last week. There were present

The new Private Cab just introduced by Messrs. Humber, Ltd. It is built on the 10-12-h.p. Coventry-Humber chassis, conforms to Scotland Yard regulations, and, notwithstanding its compactness, it affords ample seating room for four persons. The body is so arranged that the vehicle can also be used as a private open carriage.

Major P. E. T. Hibbert (in the chair), Dr. Hope, Dr. Lewis, Mr. C. W. Bartholomew, Mr. S. Yarde, Mr. Webb, Mr. J. C. Hipwell, Mr. T. Horton, and the hon. secretary (Mr. Sidney Harris).—The secretary read a letter from the Clerk to the County Council stating that the Roads and Bridges Committee had considered the letter sent by the committee of the Northamptonshire Automobile Club drawing attention to the very dangerous corners on the Peterborough and Oundle road, in the parish of Warmington, and that they had instructed the County Surveyor to erect two caution notices at the places in question. Mr. C. W. Bartholomew reported that he, having obtained the consent of the local authority, was about to erect two "concealed turning" signs at each end of the hamlet of Woodend, the signs to be placed at a distance of fifty yards from the point of danger. The existing caution notice, which is practically of no use, as it is fixed close up to the place of danger, will be removed and erected by the surveyor in some more useful position. Mr. Bartholomew will also erect at Blakesley, in positions where caution is necessary, three caution signs carrying the name of the village. Mr. J. C. Hipwell drew the attention of the committee to a very dangerous turning on the Northampton and Bedford road, where there had been several very serious accidents. He also reported that the Bucks County Council had been approached with a view to getting a caution notice, and that they would take no action. It was resolved that a letter, with full particulars, be sent to the Motor Union asking them to take steps to get a caution sign erected. The following gentlemen were elected members of the club:—Mr. S. G. Stepford Sack-

ville, Mr. Walter Bairstow, Mr. G. H. Winterbottom, and Mr. C. Wright. A vote of thanks to the chairman for presiding terminated the meeting.

SCOTTISH AUTOMOBILE CLUB.

THE Commercial Vehicle Department of the Club some time ago made representations to the Leith Dock Commissioners with regard to the exclusion of motor vehicles from the docks and harbour at Leith.

The Commissioners, having now fully considered the matter, have framed a code of bye-laws under which the docks and harbour, may be used by mechanically-propelled vehicles, and they are prepared to receive applications for the necessary permits.

MR. C. JARROTT is to preside at the dinner of the Essex Motor Club to-day (Saturday).

THE Derby and District A.C. is urging the Staffordshire County Council to erect warning signs at the village of Branston.

MR. E. H. RUSSELL, 7, Haydon Place, Guildford, will be pleased to hear from local motor-cyclists willing to join a club for Surrey.

MR. C. F. LACKY, 5, Greyfriars Road, Norwich, is the dinner secretary of the Yarmouth Motor Cycle Club, which is foregathering at the Maid's Head, Norwich, this week.

ON Saturday last a very large number of the members of the North London A.C. took part in the annual dinner in the Venetian Room of the Midland Grand Hotel. Among the speakers were Col. Bowles, Captain Banbury, Mr. A. W. Gamage and Mr. Rees-Jeffreys.

COMPANY NEWS.

A. DARRACQ AND CO. (1905), LTD.—The second annual general meeting of A. Darracq and Co. (1905) (Limited), was held on the 27th ult., Mr. E. F. Kelly in the chair, in the absence of the chairman of the company, Mr. J. S. Smith-Winby, through indisposition. The address which that gentleman had prepared was read by the secretary, and stated that the sales during the past year were £80,000 in excess of those of the previous year. For the first time they had to show a reduction in the amount of the net profits, which were £8,000 less than in the previous year, and that was to be attributed to the increased cost of raw material and the higher wages that they had had to pay. Also in order to clear their stock of finished cars at the end of the season, and in face of the general reduction of prices announced by other makers, the directors thought it prudent to offer certain increased advantages to their agents, and to increase their advertising expenditure. They had made a loss of £6,000 at one of their Continental branches. They could look to the future with quiet confidence. Already the new season showed a distinct improvement, as compared with the corresponding period, and October was quite a brilliant month, the deliveries, including cabs, being nearly five times those for October, 1906. Sir William B. Avery, Bart., seconded the motion, which was carried unanimously.

SMITH'S FLEXIBLE HUB.—£20,000. To acquire from Motor Finance, Ltd., the benefit of a certain invention. Minimum subscription, 10 per cent. of shares offered.

NORTHERN MOTOR-CAB AND TRANSPORT COMPANY.—£10,000. As title. 26, Park Road, Bradford.

AUTO-CARRIERS.—£100. As title. 158B, Norwood Road, West Norwood, S.E.

ALBANY AUTOMOBILE COMPANY.—November 27th. £100. As title. 106, Albany Street, N.W.

THE R.M.C. SYNDICATE, formed to deal in Rover motor-cabs, has been before the public this week in connection with the issue of 125,200 shares of 1s. each. Mr. F. C. Lewis is the secretary and the offices are at 109, Victoria Street, Westminster, S.W.

ARGYLL MOTORS, LTD.—At the annual meeting of Argyll Motors, Ltd., held on Tuesday, Mr. W. A. Smith, the chairman, in moving the adoption of the report, said the auditors had declared that the interim dividend paid had not been earned. The directors at the time thought the profit earned justified the payment. The turnover for the first six months showed an increase of 30 per cent. on the previous year, and everything promised well. When Mr. Govan, their managing director, died everything was thrown into confusion, and this, coupled with a deplorably wet summer, meant that sales fell off terribly. The year's figures turned out £103,000 less than the estimated turnover. Meanwhile material had been ordered for increased production. The commission drawn by the directors on the ground of the dividend being paid had been repaid. He considered that the future for motor cab and commercial motor construction was good. Mr. E. H. Watson seconded the adoption of the report, remarking that with the exercise of forbearance he was sure future results would fully compensate the shareholders. After a number of questions had been asked the report was adopted unanimously.

ATTEMPT TO BRIBE THE POLICE.

MR. JUSTICE GRANTHAM, at the Surrey Assizes, recently, fined William Nelson Barnborough, of a Jermyn Street hotel, an American, £60 for attempting to bribe Police-constable Miles, of the county constabulary, after he had stopped his motor-car for exceeding the speed limit at Esher. Defendant, who pleaded guilty, apologised for what he had done.

ALLEGED BREACH OF WARRANTY.

BEFORE Mr. Justice Ridley and a special jury, Mr. Henry Lowenfeld, of 2, Waterloo Place, Pall Mall, proprietor of the Apollo Theatre, was defendant in an action to recover £73 5s. for work done on a motor-car brought by Mr. Walter Roberts, trading as the Westminster Bridge Garage and Works. Mr. R. S. McCall, K.C., and Mr. Grimwood Mears, instructed by Mr. T. W. Staples Firth, appeared for the plaintiff; while Mr. J. B. Matthews represented the defendant. As Mr. Lowenfeld admitted the claim for the £73 5s., and as he counterclaimed for £295 for breach of warranty with regard to the car, he became in effect the plaintiff. Mr. Roberts denied the alleged breach of warranty. Mr. Matthews, in opening the case, said that Mr. Lowenfeld was attracted by an advertisement of a 25-h.p. C.G.V. car with engines of the 1905 pattern. It was said that the car was a magnificent one, and that the owner would accept £850, or an offer. Mr. Lowenfeld saw Mr. Roberts, who said that the car had not run 1,000 miles. Subsequently Mr. Lowenfeld bought the car for £550, and started off with his wife for Marienbad. During the journey from Rotterdam the motor-car broke down constantly, and on arrival at Marienbad had to be overhauled. It was found that, instead of 1,000 miles, it had travelled 4,000, and probably 9,000 miles. Some of the machinery was worn out, and new parts had to be obtained from Paris. Also it was found that instead of being a 25-h.p. it was only a 15-h.p. or 16-h.p. car, and that the machinery was of the 1904 pattern. In the course of defendant's examination, Mr. Justice Ridley asked:—Did you buy the machine from the advertisement or from the report of the engineers?—I bought it from the advertisement, but if the engineers had reported that there was anything wrong with the machine, or that it had differed in any particular from the description in the advertisement, I should not have bought it. Mr. Justice Ridley: Then I doubt if the action will lie. Mr. McCall: That is my contention. Mr. Matthews argued that the action would lie. As a matter of fact the defendant bought from the advertisement, but not knowing anything about motor-cars himself he sent experts to examine the car, to ascertain if it complied with the description in the advertisement. Mr. McCall submitted that the defendant did not rely on the plaintiff's statement, but on the opinions of the experts whom he sent to examine the car, and whom he had not dared to call.

The jury found for the plaintiff, Mr. Roberts, and judgment was accordingly given for him.

MOTOR-CARS AND INDIAN TIGERS.

IN the King's Bench Division, Mr. Justice Darling and a jury have had before them a case in which a superintendent of police was sued for damages for assault arising out of a raid on the International Athletic Club, Marylebone Road, N.W. In the course of the case Dr. Russell O'Brien gave evidence as to the injuries caused to the plaintiff. He added that if he had known what the case was he would not have taken it up. He did not like to have anything to do with motor-cars either.—(Laughter.)

His Lordship: Why not?

The Witness: Because I think they are dangerous. (Laughter.)

His Lordship: Do you mean to the driver or the person who is injured?

The witness said he would treat them as tigers were treated in India. (Laughter.)

His Lordship: You mean if anyone was hurt by a tiger.

The Witness: No; the tiger itself.

His Lordship: Oh, you mean you would not bind up the tiger. (Laughter.) Do you mean you would not attend to the man who was driving the motor-car or the man who was run over?

The Witness: I think they are both responsible.

In cross-examination the witness explained that he was once nearly knocked down by a motor-bus, and that had biased his thoughts.

His Lordship: You said before that you would put them on a level with Indian tigers, and you therefore would not attend any motor-car driver who might be injured. You also said, and that is what astonished us, that you extended your objection to the person who was run over by the motor-car.

The Witness: No; the people inside.

His Lordship: Then if people either use or drive motors you class them with the Indian tigers? (Laughter.)

The Witness: I would not care to attend to them. (Laughter.)

HORSE v. MOTOR-CAR.

MR. LINDLEY was driving a motor-car from Messrs. Simpson and Co.'s engineering works at Balderton into Newark. He had with him on the car Mr. Jones, one of the works foremen. When near the Grove Hotel, New Balderton, they were met by a horse and trap. The horse appears to have shied, and swerved across the road. It ran into the motor-car, and apparently attempted to jump over it. The frightened animal placed its fore feet on the steering wheel of the car, and jumped it, pinning the driver to his seat. Mr. Jones, who was badly cut and bruised by the shafts of the cart, escaped over the back of the car, and helped to liberate Mr. Lindley. The horse sustained a broken leg, and had to be shot. The car was seriously damaged, and had to be hauled to a Newark garage.

CASES UNDER THE MOTOR CAR ACT.

THE VALUE OF THE LICENCE.

"You hold a County Council licence for driving," said counsel to a motor-omnibus driver who was giving evidence at Shoreditch County Court.

"I do," said the witness.

Counsel.—And you consider that proves your ability to drive?—I do.

Do you know that they issue these licences to oblige people?—No, sir.

Did you apply for it personally?—I did.

Were you put through any tests?—None whatever.

Any one can get these licences who can pay five shillings?—Yes.

And no qualification is necessary?—Not the slightest.

EXCEEDING THE LEGAL LIMIT.

Ainslie Kempthorne, 26, chauffeur, was charged on warrant at Woolwich with driving a motor-car at a speed of thirty miles an hour at Eltham Road, Eltham. Prisoner told the magistrate that the reason he did not appear to the summons was that he had not the funds to pay a fine. He had been out of work almost the whole time since the offence. Inspector Wallis stated that an officer of the Essex Constabulary was in waiting to arrest prisoner on a warrant for an offence in that county. Prisoner had been convicted for exceeding the speed limit in Staffordshire, and for driving to the common danger. A few days before, at the South-Western Court, he was fined £5 for exceeding the speed limit, but this was in respect of an offence on June 24th. The magistrate said defendant must pay a fine of £10, or undergo six weeks' imprisonment. Prisoner: Can you grant time? I have half the amount. The Magistrate: No.

The same chauffeur was charged on a warrant at Kingston, on Monday, with exceeding the speed limit while driving Mr. Okura. Superintendent Marks proved several previous convictions against Kempthorne, who, he said, was last week arrested on three warrants for offences whilst driving Mr. Okura. The fines he had to pay last week totalled £15. The Bench discharged the accused on payment of the costs, £1 4s., the chairman telling him that he had been sufficiently punished for the offences committed while with Mr. Okura.

WHERE CARS ARE PROHIBITED.

James Hanning, motor-car driver, has appeared before Bailie Steven son at Edinburgh Burgh Court, in connection with a charge of having driven a motor-car on the road near Dunsappie Loch, Holyrood Park, being a part of the park where motor-cars are not allowed by the regulations. While admitting the offence, he pleaded ignorance of the regulation, and the magistrate fined him 15s., with the alternative of seven days' imprisonment.

MAGISTRATES AND THE LICENCE.

Although only four motor cases came before the Arundel County Bench on Monday, the fines imposed totalled £44 10s. and the costs £4 8s. 7d. James Adams was summoned for driving at 47 miles 648 yards per hour. Mr. Buckwell, who represented the defendant, pleaded not guilty. Inspector Wakeford said the car did the quarter-mile in 19 sec. P.C. Legg corroborated, and P.C. Heather stated that he received the signal from Inspector Wakeford. He was stationed 150 yards beyond the measured distance, and at once jumped into the road and put up his hands. The car pulled up ten or twelve yards beyond him. By Mr. Buckwell: Witness came through a convenient gap in the hedge, but only took a short time to do so. Mr. Buckwell drew attention to the fact that there was no traffic about at the time. The magistrates decided to convict, and the chairman asked to see the licence. Mr. Buckwell submitted that the magistrates were not entitled to see the licence. It was for the police, he said, to prove previous convictions. P.S. Waghorn then went into the box and proved a previous conviction against the defendant at Hailsham on July 17th last. The speed was thirty miles an hour and the fine £3 and £3 8s. costs. The certificate of a further conviction was produced, but Mr. Buckwell objected to P.S. Waghorn giving evidence upon it, as it was not for an offence of the same character as the one now before the Bench. After conferring with the other magistrates, the chairman said: "We consider it is in our power to insist on seeing the licence. Mr. Buckwell, can you state any case, or give us any authority, why we should not see it?" Mr. Buckwell: No, sir; I submit to you I have not put the defendant in the box, and I am not bound to produce the licence. I will stand on that. The Chairman remarked that whatever they saw on the licence made no difference to the fine, and with that assurance Mr. Buckwell handed up the licence. A moment later, while the magistrates were deciding the amount of the fine, he drew their attention to the Act of Parliament, which stated: "Shall produce it (the licence) within reasonable time for endorsement." Defendant was fined £20 and £1 13s. 9d. costs.

ROAD REPORTS.

AYRSHIRE.—At a meeting of the Northern District Committee of Ayrshire County Council at Kilwinning a letter was read from the Parish Council of West Kilbride anent damage done to roads by motor-vehicles, and urging the Council to take steps in the matter. Mr. McDonald, the road surveyor, reported that he had perused the letter, and he said that

the question had become a general one, applicable not only to the road at West Kilbride, but more or less throughout the district. At the present juncture road maintenance, in relation to mechanically-propelled traffic, appeared to be approaching a transition stage, and although there were already numerous modes of combating the effects of such traffic, none were thoroughly effective.

WHITCHURCH.—The steam roller has been at work in Whitchurch during the last few days, and the parts of the roads that have been mended have been rolled promptly, causing the minimum of inconvenience to motor and other traffic.

CHRISTCHURCH.—During the next few days the main roads in Christchurch from the Cross to the junction of High Street, Castle Street and Church Street will be up for repair.

PETERBOROUGH.—We understand that no extensive repairs of main roads are contemplated by Mr. J. W. Walshaw, the city surveyor of Peterborough, during the next few weeks.

SLOUGH.—The Bucks County Council has resolved to apply to the L.G.B. for a ten mile an hour speed limit in Slough.

CHELTEMHAM.—None of the main roads in and about Cheltenham will be under repair for some weeks to come, so that motorists can journey safely in the district.

SUNDERLAND.—We understand it is the intention of Mr. J. W. Mongur, the borough surveyor of Sunderland, to re-coat the whole of the main roads within the borough this season, viz.:—Newcastle Road,

The Old and New Ways of Inflating Tyres.
From a Sketch by "Galop" (Published by the Michelin Co.)

Stockton Road, Durham Road, Chester Road and Hylton Road. As regards Stockton Road there is a suggestion to double for a considerable length the tramway track, which is at present a single line. In that case the margins will be paved with granite setts upon concrete.

EAST HAM.—With regard to the repairs of main roads in East Ham, Mr. A. Horsburgh Campbell informs us that that does not affect the safety and facility of motor traffic in the district, as the whole of the main roads are now laid with tramways, and a wide space is kept clear along the centre for the constant and safe passage of motor-cars.

BACUP.—Two roads in Bacup, viz., Burnley Road and New Line, will be under repairs during the present month. Mr. W. H. Elce, the Borough Engineer, hopes they will be finished as quickly as possible.

MUSSELBURGH.—An inquiry was held in Musselburgh last week, by the commissioner appointed by the Secretary for Scotland, into an application lodged by the local town council for the imposition of a ten mile speed limit on motor traffic on certain streets in the burgh. Mr. George H. Robb, solicitor, Glasgow, appeared on behalf of the Scottish Automobile Club, which was also represented by Mr. Robert J. Smith, its secretary.

ISLE OF WIGHT.—Binstead Road, Ryde, Isle of Wight, is now under repair. This is the main road to Newport and Cowes, and the repairs will be finished about the middle of the month.

FORTHCOMING EVENTS.

DECEMBER.

- 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
 Annual dinner of the Hertfordshire C.A.C.
 Harrogate and District A.C. Annual Dinner.
 11th (W.).—Southend and District M.C. annual dinner.
 Mr. Dugald Clerk at the Institution of Automobile Engineers, on "The principles of carburetting as determined by exhaust gas analysis."
 12th (Th.).—Annual Dinner of the Sheffield A.C.
 14th (Sat.).—Motor Cycling Club Annual Dinner.
 18th (W.).—General Committee of the Motor Union.
 The Tenth Annual Dinner of the Founder Members of the Royal A.C. will be held at the club-house.
 21st (S.).—Opening of the Brussels Exhibition.

JANUARY, 1908.

- 4th-11th.—Dublin Motor Show.
 9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.
 17th (F.).—Annual Dinner of the Nottinghamshire A.C. at the Victoria Station Hotel, Nottingham.

FEBRUARY.

- Annual Reliability Trial of the Motor Union of Western India.
 7th-15th.—Manchester Motor Show at Belle Vue.
 12th (W.).—Mr. F. W. Lancaster on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 15th (Sat.).—Auto-Cycle Club Annual Dinner.
 24th (M.).—Motor Show at Bcmby.

MARCH.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

Dec. 6th-4.51 ... 8th-4.50 ... 10th-4.49 ... 12th-4.49 ... 14th-4.49
 „ 7th-4.51 ... 9th-4.50 ... 11th-4.49 ... 13th-4.49 ... 15th-4.49

CHARGE OF MANSLAUGHTER.

A CHARGE of manslaughter has been preferred at Guildford Assizes against William Adams, 19, chauffeur in the employ of Mr. John Alexander McCandlish, 117, Piccadilly, W. On July 17th Miss Rebecca Mahew, walking on the footpath at Walton-on-Thames, was knocked down by a motor-car driven by prisoner and died soon afterwards. For the prosecution it was alleged that the speed of the car was very great, but the defence asserted that at the time it did not exceed ten miles an hour. A van had turned suddenly to the off-side of the road, necessitating the car passing to the near-side. The car ran on to the pavement and knocked deceased down. Prisoner was found guilty, but was recommended to mercy on the ground of his youth. Mr. Justice Grantham said he agreed with the verdict and recommendation, and in view of it and the fact that prisoner bore a good character he would not send him to prison, but would bind him over to come up for judgment if called upon.

POLICE TRAPS.

THERE is a police-trap in operation on the road between Glasgow and Aberfoyle.

THE parishes of Walburtin and Angmering and Washington, Sussex, are almost daily the scene of police-traps.

THE Roke Road, Rogate, has its police trap, leading to Midhurst Sessions House.

PUBLIC MOTOR SERVICE.

EASTBOURNE.—The motor-bus service via Carew Road and Meads is again under the consideration of the committee of the Town Council that is responsible for the undertaking.

THE AVON INDIA RUBBER COMPANY have taken over a site at 35, Long Acre, London, W.C., whereon they will erect their London depot in the near future. Meanwhile they have acquired the premises formerly occupied by the City and Rubber Company, at 31, Brook Street, Holborn, E.C., where a stock of Avon motor tyres will be kept.

BUSINESS NEWS.

THE United Electric Tramways of Montevideo, Ltd., Bailedon House, London, E.C., have placed an order with the Daimler Company for a 36-h.p. Phaeton car of the Rugby type.

THE STERN SONNEBORN COMPANY, LTD., are inviting the attention of motorists to their Clutcholine in various qualities for metal and leather clutches.

DR. BAGO-ROBERTSON, of 3, Cathedral Street, Glasgow, reports that he has driven his 10-18-h.p. Coventry-Humber 15,000 miles in eleven months without a single mechanical stop of any description whatever.

THE MOTOR ACCESSORIES COMPANY, 55, Great Marlborough Street, London, W., have been appointed selling agents for the new Gillett-Lehman carburettor in addition to their sole agency for London and the Home Counties for the Gillett-Lehman carburettor controllers.

THE YUKON MOTOR COMPANY, Yukon Road, Balham, S.W., secured the third place in Class II. of the R.A.C. dust trials with their 18-h.p. six-cylinder Malcolm car entered by Mr. Malcolm Brooke, of the Southern M.C.

THE DEASY MOTOR MANUFACTURING COMPANY, LTD., inform us that their new telephone numbers are 1144 and 1145 Western.

MR. W. H. GOODERHAM, of Toronto, has a six-cylinder Iris car, which is rendering good service over the roads of the Dominion.

MESSRS. VALVELESS, LTD., have a 25-h.p. chassis at 7, Upper Street, St. Martin's Lane, W.C., and are arranging for cars to go on two trial routes for the convenience of those interested in the Valveless car.

VAUXHALL MOTORS, LTD., Luton, have now opened a London showroom at 157, Knightsbridge, S.W., where the latest model of the 12-16-h.p. Vauxhall can be seen, and trial runs arranged.

AMONG the posters issued in connection with the recent motor show in London, distinction was attained by those of the Daimler Motor Company.

WE learn from the United Motor Industries, Ltd., that 35 per cent of the induction coils on the cars exhibited at Olympia were of the "Castle" make.

MR. ERNEST COURTIS, who drove the winning Rover car in the Tourist Trophy race this year, has left the Rover Company and is at present unattached.

THE ADLER COMPANY, of Berlin, has made a series of experiments on a big car with the Stepney spare wheel and has been thoroughly convinced of its utility.

IN the 15,000 miles Long Distance Trial recently completed by the six-cylinder Hotchkiss and observed by the R.A.C., it will have been noticed that the petrol consumption was heavy, and only showed an average mileage of 7.35 miles to the gallon. The carburettor fitted to the engine, although being thoroughly efficient, was extravagant, and for that reason for some months past the Hotchkiss Company have been working on and experimenting with an entirely new carburettor, and have now produced a device which not only gives better results than the old one, but is also much more economical. In order to obtain an official record of the consumption of this new carburettor, a six-cylinder 40-50-h.p. Hotchkiss was submitted to a petrol consumption test under the observation of the R.A.C. on the 8th ult. The distance was 100 miles, and the result was an average mileage of 13.79 miles per gallon, the weight of the car, excluding passengers, was 1 ton 12 cwt. 3 qr. 27 lbs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, DECEMBER 14, 1907.

[No. 458.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8½d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

NOW that the controversy between the Motor Union and the Automobile Association is at an end, the former has produced its new badge, which must be regarded as an improvement on the discarded design and also as steering clear of the confusion that was possible with the earlier one. The idea of speed is well exemplified in the wings at the head of the outline, while the wheel at the bottom is equally symbolic of the organisation for which it stands. In preparing public opinion for any necessary changes in the law the Motor Union has much useful work to do, and its legal activities are equally necessary for the welfare of motorists as individuals and motoring as a movement. Recently it has extended a watchful eye on those road surveyors who seem to neglect their work on the roads by leaving long stretches of unrolled metal to harass all users of the highway. This is an important matter, and one that forces itself unpleasantly to the notice of motorists at this season of the year.

Motor Cycling.

APART from the presentation of prizes, the annual dinner of the Sheffield and Hallamshire Motor Cycle Club, on Friday the 6th inst., centred in an interesting address by the President, Mr. J. H. Hall. Mr. Hall has taken a prominent part in recent developments in connection with the organisation of motor-cyclists, and he made some pointed remarks with regard to the controversy that now seems likely to end satisfactorily so far as this section of motorists is concerned. He mentioned that there were 54,000 motor-cyclists, only about 2,000 of whom were connected with the Auto Cycle Club. Meetings have already been held at Durham, Lincoln and Nottingham, and apparently the provincial clubs are determined that the central organisation shall be really a motor-cyclists' Union, looking after the interests of those who have not, as yet, attained to the dignity of the ownership of a car or who prefer the smaller motor. Many of those who own the latter machines believe that magistrates make too little distinction between them and the possessors of large motor-cars when they are brought before the Bench, and it is felt that there are inequalities in taxation which can only be remedied by strong representations being made to the country by a body specially formed to watch the interests of those directly concerned, and to suggest a policy which will place their views more adequately before the Legislature than has been possible under the regime that now appears to be drawing to a close.

Club Life.

Now that the touring season for 1907 has been entirely left behind and club meets and gymkhanas no longer bring motorists together in pleasant assembly, many officials of provincial and county organisations are in a quandary as to how to continue the interest of members in the organisation. With its many social distractions and the claims of other movements in which individual motorists are concerned the winter period is one of anxiety to the hard-working secretary. A few years ago it was comparatively easy to get the members together by means of lectures and discussions on technical subjects, but complaint is now heard that so generally diffused has motor knowledge among motorists become that such meetings lack the zest, if not the value, they once possessed. Dinners have a sense of vain repetition unless attended by some record-maker or venturesome soul—of whom there were several a decade ago. But even here things have changed, and the attractions of past events no longer maintain their magnetic influence on any but the most ardent motoring enthusiasts. The subject is perhaps of less practical interest to metropolitan readers than to those at a distance, but all who are officially associated with motor club life will profit from the interchange of ideas on the subject.

An American View.

ONE of the most patient investigators of the features of the recent motor show in London was Mr. Alfred Reeves, the general manager of the American Motor Car Manufacturers' Association, who visited us and also the Paris Show for the purpose of gaining information likely to be of value to his countrymen in the disposal of their automobile products. Elsewhere we give his impressions as set forth in the "Motor Age," and it will here suffice to say that in his peregrinations at Olympia he was accompanied by Mr. H. C. Marmon, a member of the technical committee of the American Motor Car Manufacturers' Association.

A New Road out of London.

A DEPUTATION from the Motor Union has waited upon Mr. Kearley, M.P. (Parliamentary Secretary to the Board of Trade), with reference to a motor road scheme. Colonel Sir Herbert Jekyll, head of the London Traffic Branch of the Board of Trade, was also present. The deputation, which was introduced by Lord Montagu, presented a scheme for which they have deposited a Bill in Parliament, for the purpose of constructing a road from London westwards out to Colnbrook for the use

of motor-cars and motor-bicycles. They represented that urgent need existed for a new main road out of and into London on the west, mainly for the use of motorists. The promoters explained the outline of the scheme, and asked for the benevolent assistance of the Board of Trade. Mr. Kearley, in reply, without committing the Board of Trade to the Bill, which has not yet appeared in print, pointed out that security would have to be given that the road should revert at some future date to a local authority, or a series of local authorities, for the use of the public.

The Gilbey Hall.

VISITORS to the Agricultural Hall, London, will be interested in the extension of what was once known as the Minor Hall, but which in future will be called the Gilbey Hall. Certainly, now that the square of houses round which the Renard train was driven last year has been demolished, the site being covered by the extension of the Hall, the old name had become a misnomer. At the March Motor Show the Gilbey Hall will accommodate an important section of the great exhibition which has become known throughout the world as Cordingley's.

The above illustration depicts Mrs. Walker Munro, of Rhinefield, Hants, on her Six-Cylinder Napier coming out of the horse-shoe shaped entrance of the garage at her seaside residence, The White House, Milford, Hants.

This house, a view of which is given in the upper picture, is most interesting, as it was specially built with an eye to motor vehicles, the garage being in the centre of the building. Mrs. Walker Munro, who was one of the first ladies to drive her own car, has had six Napier cars, and altogether has driven over 60,000 miles, including many tours on the continent, through France, Switzerland, &c.

Motor-Car Imports and Exports.

THERE was a marked revival last month in the importation of foreign motor-cars and parts into this country. The number of complete vehicles which reached the United Kingdom during November was 409, their value being given at £173,712. Parts were responsible for an additional £193,614, which gives a total of £367,326, as against only £358,255 in the corresponding month of last year. For the first eleven months of the current year the figures are:—Number of cars imported, 4,615; value of same, £2,002,068; imports of motor parts, £2,325,756; total, £4,327,824. For the similar period of 1906 they were:—5,553 cars of a value of £2,385,261; parts, £1,764,285; total, £4,149,546. Turning to

the exports of British motor-cars and parts, these continue to show a steady expansion, the number of vehicles shipped during the eleven months ending with November last being 2,116, of a value of £782,958; to this have to be added parts estimated at £433,527, which gives a combined total of £1,216,485, as contrasted with only £718,636 in the corresponding period of 1906.

The Daimler Scholarship.

WE have received from Coventry particulars of the Daimler engineering scholarships, the announcement of which at the recent dinner of the company was duly recorded in our columns. These will be five in number, tenable at the Daimler works for two years, and will be awarded in July of next year. Candidates must not be younger than eighteen years and not older than twenty-two years on July 1st next, although exception will be made for those who have spent twelve months or more in a workshop and who are not more than twenty-three years of age at that date. Candidates must have passed the examination of some recognised educational institution, and the scholarships will be awarded on the result of an elimination test, an essay on some engineering question, and a *viva voce* examination. With regard to the first of these conditions the candidates must present themselves at the Science and Art examination in May, and forms of application can be obtained from the pupils' department of the Daimler Company at Coventry.

The Holidays.

WE have received communications from some of the leading firms in the motor industry with regard to the course of business during Christmas week. It will probably not have escaped the attention of our readers in the industry that Christmas Day this year falls on a Wednesday, Thursday being Boxing-day and consequently a holiday. Therefore it is suggested that only a little arrangement with the staffs of the various firms would be necessary to secure a vacation running from the Christmas Eve to the following Monday morning. Doubtless, after the rush of the Exhibition, such a break in business routine would be welcome to the majority of members of the Metropolitan trade. It would also be appreciated in the provinces. There is, however, another aspect of the matter so far as the latter is concerned, for, given fine weather that week, a good deal of hiring of cars for house parties and the like is being anticipated by many enterprising firms, and probably the practice might not be so universally possible in the country as in London.

Cost of the Motor- 'Bus.

AFTER a series of calculations, Mr. W. E. Hardy, the engineer of the Bath Electric Tramways, which runs motor-'bus services throughout the district, has come to the conclusion that the total working costs of the average motor-'bus company come to 90 per cent. of the total receipts, and that therein lays the obstacle to a more general adoption of this mode of traction. At a meeting of the Society of Road Traction Engineers on Tuesday he took the case of a company owning twenty motor-omnibuses running an average of thirteen daily a distance of ninety miles each. The working costs, including depreciation, for a week he estimated at about £370. By following that figure out for the fifty-two weeks in the year, and filling in receipts at a shilling per mile, the profit would amount to £2,024 odd. He pointed out that the sum of 1s. per mile was a high rate to estimate on, for 10d. was about the average on most tramways in the country, and, moreover, the electric car could accommodate some 55 to 60 people, whilst the seating capacity of the motor-'bus was only 32 to 35. Accordingly, he considered that if these companies were to pay, the cost of working must be reduced, and the items to which, in his opinion, attention should be given, were petrol, oil, grease, and carbide, tyres, repairs, and

attendance, and insurance. Improvements and economy in the use of petrol and oil would probably soon lower the bill for these items, but tyres were the "dead weight" of the motor-bus, pulling it down all the time. Repairs and attendance worked out at 2½d. per mile, which seemed a large amount, but there was little hope of any immediate decrease in that direction. Insurance was largely a question of tyres, and as soon as the skidding propensities of the motor vehicle were reduced the premiums would be lowered.

Accepted Challenges.

New interest has been given to the 1908 programme of the Brooklands A.R.C. by the announcement that some of the challenges recently issued by Mr. S. F. Edge have been accepted, and that the events will be run off on the track at Weybridge between May 14th and July 1st next. The President of the Metallurgique Company of Belgium has accepted the challenge in the 26-h.p. and the 40-h.p. classes, and Mr. O. Cupper will drive Metallurgique cars against Napiers in both events. Similarly the challenge in the 90-h.p. class has found an acceptor in Fiat Motors, Ltd., and Mr. Nazzaro will drive

frequently happens in the case of motor-cycles. In fact, in one case Mr. Percy J. Sheldon, the Registrar for the Act in the county of Essex, recently found that a machine had changed hands six times, and the only intimation he had had was from the last owner. In order to familiarise motorists with their duty in the matter he has issued an official announcement through the county Press quoting the law on the subject, and concluding that "It must be distinctly understood that if persons drive motor-cars or cycles that are not properly registered, they will be held responsible for any proceedings that may be taken by the police authorities." The hint is one of universal application.

Earl Russell and the Club.

WITH reference to the correspondence which Earl Russell recently had with the secretary of the Royal A.C., his lordship finds that his recollection was at fault as to what took place at the committee. Some shorthand notes have been produced from which it appears that the chairman was asked whether some statement as to provincial clubs would be made public together with the resolution, and the chairman appears to have replied that such a statement would be made public. The chairman him-

The Berlin Motor Show.—The Arrival of Prince Henry of Prussia on the Opening Day.

the Fiat car. Deposits have already been made, and the motoring world will await the events with some eagerness. Certainly such challenges and acceptances will whet the sporting appetite more than was the case with the programme of the present year.

Change of Ownership.

WHEN a motor-car changes ownership the fact should be notified "either by the new or the old owner to the Council with whom the motor-car is registered, and an application shall also be made either to cancel the registration of the car or to continue the existing registration under the ownership." Such is the essential point of Article 4 of the Local Government Board Regulation under the Motor Car Act, 1903, which also entitles the local registering authority to charge fees of five shillings and one shilling respectively for alterations in the registers of motor-cars and motor-cycles. As the onus of notification is left to either the seller or the buyer of such cars, responsibility in the matter is often shelved, and no notice of transfer is given to the authorities—a procedure which

self, Mr. Rose, does not agree with Earl Russell's recollection that he stated that nothing but the resolution should be published, and there appears to have been misapprehension as to a conversation on this subject. In these circumstances Earl Russell withdraws unreservedly the suggestion that the statement was published without authority. The mistake, he says, would have been avoided if the secretary, in his letter, had referred him to the verbatim report and given him that information which a member of a committee expects from its officials.

MR. CHARLES CORDINGLEY has left London for Marseilles, en route for Algiers, whither he has gone for the benefit of his health. He will be away for several weeks.

THE fouling up of cylinder heads is a trouble which may generally be ascribed to the prevailing use of automatic carburettors, which usually supply a very rich mixture for very slow running. Four years ago the fouling up of cylinder heads was almost unknown, but nowadays it is a very good plan to have the cylinder heads scraped out after four or five thousand miles running.

A TOUR IN BRITTANY.

(Concluded from page 895.)

NORTH-WEST of Morlaix is the Pays de Leon and Finistère, a region to be "explored" by any automobilist who likes to get away from the beaten track. The roads are passable, that is, good enough as to surface, when they are not loose or broken up, but the hills are practically a continuous performance. It is a region away off from the rest of France, the "Land's End" of North Europe, and no one among its peasant population knows or cares for anything away from his immediate environs. *Essence* and *huile* are hard to find; the native never ceases to marvel a *la mécanique* and marvel still more when you put in the "reverse." It will be some years yet before "*ces choses droles, ces automobiles*" will fully "arrive" in the wilderness of Finistère. Between Morlaix and Brest, Landivisian and Landerneau re interesting, but Brest itself had better be omitted

two kilometres by the route nationale, Nantes-Quimper. Ros-porden is a sleepy, dull town, with nothing to detain the tourist more than a glance of the eye, but it is the turning point for Concarneau—where the sardines come from. Concarneau is ancient, picturesque and smelly, but it is delightful all the same, and the sea food served at déjeuner at the Hotel des Voyageurs will be remembered for long. *Langouste remoulade* and *sardines fraiches* are *plats* which cost relatively large sums of money on the Paris boulevard, but here they are regular *plats du jour*, and one pays three francs only (*vin compris*) for déjeuner or dinner.

Pont Aven for the night, at the Villa Julia, is the best thing to be had in Brittany. Julia years ago ran a modest little artists' hotel, but to-day it has grown with prosperity until there is a great four-story brick and steel structure beside the little inn. Blanche Willis Howard's story of "Guenn" will tell you much of the life of the peasant folk of Pont Aven, and ought to be read *on the spot* to be thoroughly appreciated. There are fourteen water mills at Pont Aven, and it is locally known as the *Ville des Moulins*.

Touring in France.—Market Day in the old town of Auray.

From Landerneau to Plougastel is a dozen kilometres, and the view over the great Rade de Brest is finer than anything from the other shore. For the night Plougastel-Daoulas is not bad. The Hotel des Voyageurs has been braced up quite recently by the Touring Club de France, and is about the most modern thing in the hotel line in these parts outside the large towns.

From Daoulas, fifty or sixty kilometres out and back, will bring one to Crozen and Camaret. There are no sunsets quite so brilliant in western Europe as those over the bay of Camaret. If that interests you the detour is worth making, otherwise one reaches Quimper from Daoulas, *via* Chateaulin, by *route nationale* No. 170, in sixty kilometres. From Quimper there is a hundred kilometres round to Douarnenez, Port Croix, Pont l'Abbé and Penmarc'h that shows the best of Brittany; the quaintest, the least spoiled, and the most picturesque customs and costumes of men and women. Quimper has twenty thousand inhabitants, and, if one excepts the great marine arsenal of Brest, is the metropolis of Finistère. From Quimper to Rospenden is twenty-

Fifteen kilometres eastward from Pont Aven one strikes the route nationale again at Quimperlé, charmingly situated on a little tidewater river with a couple of admirable old churches, some curious houses and a good café-hotel, the Lion d'Or, on the quay. Lorient is 21 kilometres east of Quimperlé and is an unappealing seaport, once the headquarters of the French East India trade. It is the least lovely large town in France, in spite of the fact that it is endowed with a magnificent situation. The inner man and the automobile will find nothing here that may not be had better elsewhere. Ten kilometres after Lorient is Hennebont, situated on the estuary of a deep-cut little river, the Blavet. It is all Lorient is not, an ideally picturesque spot with charming promenades along the river banks, some old moss-grown fortifications, innumerable curious old houses, a stupendous late Gothic church and a most excellent hotel with "good enough" garage accommodation. If you have slept at Pont Aven, cut your journey here and take déjeuner in the all-sufficient little Breton Hotel de France at Hennebont. If time presses, how-

ever, keep on to Auray, where, at the Lion d'Or, you will do equally as well, 28 kilometres farther on.

The monuments of Auray and round about are very numerous and interesting. There is a pilgrimage to be made to Ste. Anne d'Auray—where, on July 25th in each year, is held a great religious fête—and the excursion down the great peninsula of Quiberon and through the *Lignes de Carnac*, the name given to a regiment of great stone *menhirs* like those at Stonehenge, only here there are thousands instead of scores.

Off-shore, a dozen kilometres, is Belle-Ile, where Fouquet ensconced himself when he fled from the wrath of his king after the great fête of Vaux, and where Aramis of the "Trois Mousquetaires" became a landed proprietor. To-day Belle-Ile is a little island kingdom all by itself, with a capital, Le Palais, a local newspaper, and hotels and restaurants, even though a good half of the population have never set foot on the mainland. There are no automobiles on the island, and the greatest celebrity is Sarah Bernhardt, who has a summer home here. From Auray to Vannes is twenty odd kilometres, skirting the north shore of the Morbihan, a great inland bay.

On the road hereabouts the Breton types are seen at their best, young men and maidens and old men and market-women, but all of them picturesquely clad. They invariably walk in the middle of the road, and it takes more than a mere "honk" of the horn to make them move.

Another warning may be given here, though it might well have been put at the beginning of this article. There is an infrequency of motor-cars in Brittany, and for that reason live stock, particularly horses, donkeys and mules, are easily frightened. There is no pleasure or satisfaction in bolting a donkey cart into a ditch and spilling out its invariable load of lovely femininity—for they are lovely, the little Breton maids. Go slow, then, and be rewarded by smiles instead of frowns. At all times, when stopping, look carefully over the tyres and extract the *sabot* nails, the great flat-headed hobnails of the Breton peasant's *sabots* which drop out in dry weather when the wood around them shrinks. The nails will not penetrate the tyres if they are thick enough; but if they are not you will suffer continual annoying punctures. In Brittany one must be more careful than elsewhere. Vannes is a great, big, overgrown country town. It rises to the dignity of being a Préfecture, but is a sad, dull place with inefficient hotels and only interesting for the visitor because of its accessibility to the Golfe of the Morbihan, its old houses, its thirteenth century cathedral, its old city walls and the grim donjon known as the Tour Connétable, in 1387 the prison of Olivier de Clisson. Pass Vannes by so far as eating or sleeping goes, if possible, and keep on to Rochefort-en-Terre or Redon; you will do far better at the Hotel le Cadre at the former place or the Hotel de la Poste at the latter. Each abounds in character, a vague term, but one understood of the travelled person. Rochefort-en-Terre is a little artists' paradise exploited almost entirely by French and Americans

jamais les Anglais, says the patron of its little next-to-the-soil hotel.

If the atmosphere here is too artistic another twenty kilometres brings one to Redon, and if you don't have to wait an interminable while at the railway gates you will be very pleased indeed with your déjeuner eaten in the *salle à manger* of the Hotel de la Poste—one might say the *musée*, for the walls are hung with all sorts of curious trumpery—some of it good, but certainly as great a hodge-podge as was ever collected by a cranky hotel proprietor. Barring this idiosyncrasy he knows well how to run a hotel, though it is abominably situated opposite the railway station and has no pretence to architectural beauty of any kind whatever. The gates of the railway crossings throughout Brittany, and frequently in other parts of France

as well, are often kept closed. This is a protection for the public, of course, and cannot be complained of, beyond wishing that the day may soon come when all level crossings shall be abolished. It is annoying, nevertheless, to be held up at a French railway crossing, or *passage à niveau* to speak the vernacular. Usually it is guarded by a feminine personality of uncertain age, who simply tells you in response to an inquiry, "*On ne passe pas!*" "Where is the train?" you ask, with an absolutely clear view up and down the line for five kilometres. "*Il peut venir,*" she tells you coldly. "Yes, truly, it may come; but why does it not come?" You wait, perhaps, three, five, ten, or fifteen minutes at this Robespierre of *passages à niveau*, but the woman is incorruptible—as she should be, that we will not deny.

From Redon to Chateaubriant is fifty-four kilometres, and if you have had enough for the day the modest little Hotel de la Poste will care for you admirably. You will eat of simple fare served by a dainty coiffed Breton maid, and most likely somewhere in the dinner's menu will be a *boudin*, which is a black sausage made of congealed pig's blood—and some other things. You needn't eat it if you don't like; there will be plenty else. There is a *moyen âge* chateau here with pepper-box towers and all the ear-marks of the best Renaissance architecture, and there is a legend concerning the horrors of the time when a certain

Comtesse de Chateaubriant was first almost starved to death in a dungeon and then cut into pieces by the surgeons upon the orders of her unworthy spouse. So altogether—what with the *boudin* and the drawing and quartering and a church bell that clangs loudly every quarter hour—there is every prospect of pleasant dreams.

It is from Chateaubriant that the chateau country of Touraine can best be tapped on returning from the Breton tour. It is 75 kilometres to Angers, the southern gateway, where is opened up the whole Loire Valley and the water-sheds of the Vienne, the Indre and the Cher, embracing the best of Renaissance chateaux and the "Garden of France."

The route back to Paris taking in the chateau country is scarcely prolonged 250 kilometres, while the direct road *via*

Touring in France.—A Mors Car at the Cathedral of Rheims.

Laval is a trifle less than 400. As a variation, and since after a Breton tour hills may be presumed to have no terrors for an automobilist, another cross-country route to Paris, omitting the chateau country proper, is *via* Serge, 40 kilometres; Chateau-Gontier, 24; La Flèche, 54; Le Lude, 19; Chateau du Loire, 21; and Vendome, 59. It is a most charming and unconventional itinerary, entirely by second and third class roads, but most excellent roads they are, crossed only here and there by routes nationales, but nearly as good; and when one does get a long, silent stretch, with a gentle slope downhill, he may make any speed he likes, and no one to say him nay, unless he meets with a brace of strolling gendarmes, who are everywhere in the most unexpected places—in France. *Méfiez vous, alors!*

Vendome is better known than the last half-dozen large towns, and is a most interesting place. Hotel accommodation is scant and not remarkable, though good. But the architectural monuments, the flamboyant Gothic church, the Hotel de Ville, and the Chateau Donjon are worth doing, if only by moonlight, after dinner, when peasants and blue hussars wander aimlessly. From Vendome to Chateaudun is forty-one kilometres, with nothing to hold one's speed down save an excessively dangerous *passage à niveau* at Monplaisir, thirteen kilometres from Vendome, and another at Cloyes, a dozen kilometres before arriving at Chateaudun, with its memories of 1870-71. This town (Hotel du Bon Labourer) is a good place for déjeuner or for the night, but Bonneval, fourteen kilometres further on towards Chartres, is better—for déjeuner, at any rate. The Hotel de France will give you about the best country fare you will get in France—chickens, veal, crisp salads, asparagus, strawberries and the like. All are in season between May and September; at any rate, they have four or five months of strawberries—such strawberries as are found only in France. By Vitray-en-Beauce, through the great grain-growing region of France, one arrives at Chartres, thirty kilometres from Bonneval. From Chartres it is plain sailing and easy going to Paris, *via* either Rambouillet or Ablis. In either case, *via* either Versailles or Sceaux, one strikes the terrible *pavé* of suburban Paris twenty kilometres before the capital is finally reached. If one is going east to Fontainebleau or the Côte d'Or the route from Chartres is *via* Ablis, Etampes and La Ferté-Alais. If the north, Normandy or the seaport towns in connection with England are the objectives, suburban Paris can be avoided by crossing the Forêt de Rambouillet and through Houdan to Mantes.

To sum up: The roads of Brittany, the main roads, are excellent, but hilly, and so long as one is ready for surprises of sharp ascents and descents, particularly in the towns, for innumerable sabot nails in the tyres, for frightened donkeys, geese and peasants, and for gendarmes always looking for trouble, the Breton tour is as enjoyable as any in France. One must not forget that it is 600 kilometres out and back from Paris or the Seine Valley before one comes to Brittany proper, and that this will take two or three days' travelling, going and coming, besides the 800 or more kilometres making the Breton circuit.

ALAN COLQUHOUN of Luss has purchased a 42-h.p. landaulet from the Daimler Company.

THE Association Automobile Mexicaine has just been formed in Mexico to promote motor races in the Republic. It is proposed to hold the first race at Gaudelajara in March or April next, while a scheme is also under consideration to construct a motor-racing track.

THE Taunton Motor and Cycle Company, of which Mr. R. E. Denning is the proprietor, has a number of motor-cabs and motor-broughams for hire in the town. They are being used by local business men in the daytime, as well as by ladies for social functions in the evening.

A MEETING of the Mechanical Branch of the American Association of Licensed Automobile Manufacturers is about to be held in Chicago to discuss the standardization of automobile bodies, co-operation between automobile engineers and coach builders, the reduction of weight and the proper wheel base for a practical car.

THE "BOWDENLOC" LEVER.

THE advantage of the self-locking type of lever for most of the operations connected with the control of motor-cars or cycles is now so generally admitted that the latest introduction of the E. M. Bowden's Patents Syndicate, Limited, cannot fail to evoke interest among all sections of motorists. The Bowdenloc Lever, which we illustrate in Figs. 1 and 2, has been designed with a view to the special requirements of the Bowden wire mechanism, while at the same time being equally applicable where any other form of self-locking lever can be used to advantage. The merits claimed for the Bowdenloc are many, and may be summarised as

Fig. 1—Bowdenloc Lever (assembled).

follows:—1. No springs are used. 2. The lock is automatic and immediate in action. 3. The lever responds at once to the manipulation of the operator, while remaining absolutely immovable to any tensional strain from the wire. 4. There is an entire absence of backlash or shakiness, no matter at what point the lever may be left. 5. Overpulling is impossible, stops being provided to prevent the lever being moved too far. 6. The wire is at all times fully enclosed. 7. The wire does not come in contact with any sharp edges, and is not bent at an acute angle. That these advantages are not overstated can to a certain extent be grasped by an examination of Fig. 2, which shows the lever dissected in conjunction with the following description:—A represents the body recessed to receive the drum or disc B, to which the inner member of the Bowden mechanism is anchored by

Fig. 2.—Bowdenloc Lever (dissected).

means of the block H, the wire passing out through the projecting portion of the body A. This projecting piece is specially designed to serve as the necessary stop for the outer member. D is the lever with a stud E on its inner face, which engages with the hole in the pawl C, the disc B being cut to accommodate the pawl, as shown. The various parts are held together by the screw and washer, G and F. In operation, the movement of the lever D revolves the disc B along with the pawl, the two remaining concentric, but on pressure being removed from the lever the tension of the wire on the disc B causes the pawl to tilt and wedge itself against the inner periphery of the rim on the body A, the wire mechanism being thereby held firmly locked until released by again operating the lever D. The levers are made in various sizes, while the material and workmanship throughout are of the highest quality.

It is reported that the makers of the Itala cars are taking up the construction of commercial motor vehicles, in the design of which a number of special features will be incorporated.

AN officer of the Society of Automobile-Mechanic Drivers of the United Kingdom is always in attendance at Rawlings' Garage, Halkin Street, Belgrave Square, London, to give advice to drivers and others interested in the chauffeur side of motorism.

AN AMERICAN VIEW OF BRITISH AUTOMOBILE DESIGN.

BY ALFRED REEVES.

THAT the strongest tendency is toward the small car here as in America; that the changes in the 1908 models, both French and English, are in the matter of detail, the makers apparently being willing to fall into conventional practice; that it is a battle for lightness in construction, and the total absence of the three-seated runabout so popular in America, are some of the impressions gained by two Americans after a careful study of the motor-car show at Olympia.

From our English cousins we can learn a great deal, and, in my judgment, it is a grave mistake for American makers to neglect sending a representative to visit this show. On the other hand, there are many things in which, without egotism, it might be stated, John Bull could learn much from our shores, particularly about our methods of doing business. While there has been some reduction in prices, as forecasted months ago, it has mainly affected the big cars. The trade outlook is very good, although nothing of a boom nature. There has only been a slight falling off in attendance, and the feeling among the dealers is one of conservatism but not pessimism.

frame without the use of arms integral with the crank-case; three-fourth elliptic springs on the rear; larger brakes, and grease cups on ball-and-socket steering joints; hand adjustment for brakes; the casting of all four cylinders in one on small cars; the use of the thermo-syphon system on town cars; a change in the carburettor which locates the auxiliary air valve on the manifold instead of on the carburettor; the exhibiting of a shaft-driven car in every space at the show except Mercedes; the inclination to increase rather than decrease the present long wheel-base; the use of ball bearings on the transmission shaft; an increase in the use of shock absorbers as general equipment; an unlimited fancy in regard to the design of radiators; a growing practice to leave off the spark adjustment on the steering wheel; a comparative lack of interest in self-starting devices, there being only two cars using it as regular equipment; and a tendency to have as little as possible on the dashboard.

There is the ever-apparent English design made on the lines of practicability rather than looks, and the thorough workmanship of the English mechanic. One is impressed with the air of business that permeates the atmosphere of the Olympia. There is very little attention paid to general decorations, such as mark the American shows. Some plain red and yellow bunting

The Visit of the Swazi Chiefs on Argyll Cars to General Booth, at the Headquarters of the Salvation Army, on the 4th inst.

It is absurd for us to blind our eyes to the fact that the demand is now for the small car, especially those of 15 to 20-h.p., and selling at less than £400. No one denies that there will always be buyers for the big, high-priced cars, which certainly have had a rage for some years, but just now the buyers seem to favour the small machine. The popular car here and the one greatest in favour is that of 10-12-h.p., having a four-cylinder engine and with a body made to carry four persons. It is peculiar that the only runabout with a rumble seat, so universal in America was at the Buick stand. There has been apparently a great effort to reduce the weight of cars, and students of motor-car construction are of the opinion that this tendency will continue.

In a stand-to-stand examination Mr. Marmon and myself were impressed with certain tendencies from an American point of view, some of which might be of general interest. Among other things we noticed some advances in the use of the motor as a brake; the almost total disappearance of cone clutches; an effort at reviving the front drive for town cars; a decided improvement in coach-work and conveniences for passengers; the use of tubular front axles on many English cars; adjustable clutch pedals; a ratchet sprag on the transmission; the use of a brake on the transmission; the placing of the crank-case in the

and a few additional arc lights are all the general decorations, although many of the individual stands show artistic tendencies that catch the eye and make an impression. The building itself seems bare and barren, but the individual stands go to extremes in decorations.

So far as London itself is concerned, the battle is now between the pleasure and the business motor. The former has had its rage, and in the opinion of many has settled down to a good business basis. The cry is on now for the commercial vehicle, and here we find everything from the taxi-cab, of which there are about a thousand in London, and the double-decked motor-bus, to the traction engine hauling four or five car-loads of coal.

ONE of the new radiators of the Coventry Motor Fittings Company, of Far Gosford Street, Coventry, is a gilled device of the honeycomb pattern of exceptionally good appearance as well as of real strength. It comprises a series of vertical tubes with horizontal corrugated gills extending across the whole length of the radiator. The corrugations being arranged opposed to one another, the general front view is that of a honeycomb radiator with squares turned to an angle of 45 degrees.

B

SOME NOTES ON INDUCTION PIPES.

BY A. E. S. CRAIG.

THE question of the best design to adopt for the induction branches of multi-cylinder motors is much more involved, and of far greater importance to the working efficiency of the engine, than a casual observer would imagine. Many designers sacrifice, either through insufficient study of the question, or through a too keen desire to attain a symmetrical effect, a lot of the power which might otherwise be obtained from their motors, and the consequence is that, no matter how perfect may be the carburettor, the ignition, and the engine itself, it is condemned for all time to work with perhaps two of its cylinders half starved, whilst the remainder are getting their full allowance.

It used to be, if not the fashion, at least a very prevalent idea, that a long induction pipe was a thing to be aimed at, and I well remember, when doing some work on the motors of a certain airship, stumbling over yards of unnecessary copper pipe which had been installed on the advice of an "expert," with the promise of greatly increased power and a glorified "mixture." Before, however, the airship was wafted to its early doom, I observed that the induction pipes had been shortened to a more reasonable length, possibly owing to the terrible efforts required to induce the carburettor to sympathise with the desire of the motor to begin operation. Quite a large percentage of designers nowadays agree in making the branches as short as practicable, and at the same time endeavour to secure that each lead shall be equi-distant. This at first sight appears to be quite the correct thing, but owing to the sequence of induction disturbing the momentum of the explosive mixture, this fact has to be taken into consideration. Some have endeavoured to mitigate the effect of the disturbance by enlarging that part of

the best conditions a certain relative bore in the induction branch, and any portion of the same too large or too small in diameter must necessarily militate against best results.

I have mentioned induction sequence as a disturbing element, and a few words will explain my meaning. Most four-cylinder engines fire in the order 1, 3, 4, 2. Now assuming, as in Fig. 1, a perfectly equal distance and facility from carburettor

FIGS. 3 AND 4.

FIGS. 1 AND 2.

the induction branch which, as in Fig. 3, is common to the leads, to the cylinders, and to the carburettor, but this is obviously mistaken practice if the highest efficiency is to be attained. Alternately small and large areas are wrong, and the higher the flash point of the hydro-carbon employed the more pronounced becomes the effect of the error. A certain cylinder bore and piston speed demands for the supply of explosive mixture under

to each inlet valve in the first case, there is a tendency to starve cylinders Nos. 3 and 2, because these two will be found to have to do a considerable amount of "donkey work" in dragging up mixture for their neighbours. Changing the sequence of firing will only rob Peter to pay Paul, and therefore the type of branch precisely as illustrated is not good practice. To modify the branch in such a manner as to equalise things is an easy matter, but to an inexperienced eye the modification will look lop-sided. The same disturbing influence occurs when, in the twin cylinders of four-cylinder engines, there is a common port to two induction valves. The type of branch, as Fig. 3, equalises to a great extent the distribution, because if in the branches, as Fig. 1, the two middle cylinders have a tendency to be starved, the form shown in Fig. 3 must tend to counteract the effect by making the outer cylinders more remote, and by equalising the columns of gas in motion to each. I am, of course, assuming a carburettor of proper capacity and adjustment, otherwise results will be so erratic that no correct conclusion can be arrived at.

A method that I cannot find any particularly logical arguments in favour of consists in placing the carburettor at one end of the main branch, as in Fig. 2. Even if a compensation is sought by tapering the main pipe so that the large end is remote from the carburettor, the result is bad, and in the usual sequence of firing cylinder No. 3 stands a poor chance.

Most induction branches are cast, and herein lies a continual chance of error; for, however perfect may be the external contour, the coring, either of the main or sub-leads, may be hopelessly faulty. Nothing but a careful measurement of the inside of the casting of each branch fitted will ensure consistent results, and I am sure that conscientious inspection is well worth the trouble, and that the reason why some engines of the same make, and apparently similar in every respect, give vastly different results on the brake may often be traced to the source indicated. The same remark holds good with almost equal force to built-up branches, which are usually made of copper pipe. Although the bore of this pipe is of course regular, the

holes-made in the side of the same by the coppersmith may be anything but similar in shape and area. I am speaking of that class of branch as in Fig. 3, where the leads are fitted by means of saddle laps to the main tube. Jagged irregular edges and unequal areas are of course fatal to good results.

Reverting to the question of enlarging a portion of the branch so as to obtain, as it were, a reserve of gas to draw from, I have found in practice that in branches of the type shown in Fig. 3 a fairly good result is obtained by prolonging the ends of the main tube about six inches past each end lead, and I believe this is more effectual than increasing the diameter abnormally.

Fig. 4 illustrates a somewhat costly and elaborate system of pipes to give equal distribution, as regards distance from carburettor, to all the leads of a six-cylinder engine. The number of corners that the gas is obliged to turn must militate against efficiency, besides the condensation which is certain to occur.

THE PRINCE HENRY OF PRUSSIA TOURING COMPETITION.

SOME details of the Prince Henry of Prussia Touring Competition, which is to be held in Germany next year, in the place of the Herkomer event, have just been issued. It was originally intended to make the contest one solely for amateurs, but it was represented to Prince Henry that, if this was adhered to, German manufacturers would have no event during 1908, and it

The First Four-Wheel Wolseley Car.

The vehicle was built in 1898-9; it was fitted with a 3-h.p. horizontal engine having a mechanically-operated inlet valve, and three speeds obtained by a single belt.

was finally decided that they should be admitted. Measures have been taken, however, to place amateurs driving their own cars on a comparative equality with expert drivers. The general conditions upon which the contest will be run may be briefly stated as follows:—Each day competitors will be allowed to spend one hour in making adjustments, oiling, and filling up the tanks with petrol and water; classification will be by cylinder capacity and car weight; the order of starting each day will be governed by the horse-power of the cars; the speed of the vehicles will be regulated by official vehicles, which will accompany the competitors on their daily runs. The competition will occupy seven days, the course being laid from Berlin to Frankfort. On the first day the competitors will cover a distance of 476 kilometres from Berlin to Dantzic; the second day's stage will end at Stettin; the third at Kiel. The fourth day will be a day of rest, and on the fifth the route will be from Kiel to Hamburg, via Flensburg, during which a speed test will probably be held. The sixth day's stage will be from Hamburg to Dusseldorf, via Bremen, and the tour will conclude the next day, after a hill-climbing contest between Dusseldorf and Frankfort. No fewer than six prizes, in addition to Prince Henry's Cup, will be offered. The German Imperial Automobile Club will be responsible for the organisation of the competition.

THE COMPLETE MOTORIST.*

WHEN Sir Dyce Duckworth last week referred to the present era as the Motorial Age, and regretted the decadent effect it was having, in his view, on the womanhood of the country, he had not seen "The Complete Motorist" of Mr. Filson Young. For that work contains a letter from Lady St. Heliers which is such an able defence of the lady motorist that even Sir Dyce would have recognised how grossly unfair he was in his generalisations with regard to ladies and motoring. She writes of the fascination of motoring, and "the enjoyment of the consciousness that you are getting away from your fellow creatures, that every man, woman, child, village, hamlet or town is a landmark passed on the journey which you would like to lead to perfect solitude. There is no sensation so enjoyable—except that of riding a good horse in a fast run—as driving in a fast motor." This ill accords with the learned knight's ideas of a slower age, in which speed shall have no place and women shall lag behind.

How we have arrived at the present stage of speed is well told by Mr. Filson Young, whose book is now in a seventh edition. We have the familiar story of the midnight rides of Trevithick on Cornish roads, of Cugnot's machine attacking the wall, of Hancock's success in running steam 'buses seventy years ago, of Gurney's services and of the hostility of the tollgate people towards the new locomotion of the pre-Victorian days. Then came a great void, and when Daimler appeared upon the scene it was with the internal combustion engine, upon the basic principles of which the modern automobile has been evolved. Several types of Twentieth Century petrol cars are described, including the Crossley, Daimler, Lanchester, Humber, Siddeley, Austin, Mors, Renault and Sizaire-Naudin. The White is illustrated and its good features described, while we congratulate Mr. Young on the omission from the present edition of the account of a steam car which has not yet found its way to the market, and of which, consequently, nothing can rightly be said.

Practical chapters are concerned with the selection of the car, its use and running, and also its care. He places the average annual mileage of a small car in constant use at 5,000 miles, and suggests that a vehicle so well employed should be thoroughly overhauled in every detail once a year so that all worn parts may be replaced. That "boon and bane of motoring"—the pneumatic tyre—has a chapter to itself, and the motorist is told that his neglect and misuse of the tyre is the cause of many of his troubles. A good word is said for the Palmer Cord tyre, and the practical person is advised to equip the rear wheels of his touring car with nail catchers, which often prevent puncture—and that is always better than repairing the same. Reference is also made to the literature of motoring, and while we thank Mr. Young for placing on record the work of the M.C.J. in popularising motoring, we would remind him that it is now in its ninth, not its sixth year. Anyhow, our readers will recognise the accuracy of the statement that the Journal "gives the purchaser more for his money than any other motor-car paper with the possible exception of the —."

The least satisfactory part of a really valuable work is the appendix. Here we have the report on the Small Car Trials at Hereford in 1904—almost ancient history in the automobile world. These might well have been omitted, and the report on this year's Scottish Trial could usefully have taken its place. Seeing that, like Tennyson's brook, cars may come and cars may go, such lists should always be brought well up to the time of writing. Otherwise we have nothing but praise for a book that occupies a well-worn corner of our bookshelves, and which Mr. Filson Young's facile pen has invested with an easy interest for all men, whether they drive or not. It has, in fact, become a standard volume.

THE Newcastle Corporation is being invited by the Town Improvement and Streets Committee to purchase a motor-car for the service of the City Engineer's Department.

* "The Complete Motorist," by Filson Young, with 135 illustrations. London: Methuen and Co.

THE STEWARD TUBELESS SEMI-FLASH BOILER.

ABOUT a year ago we had our attention drawn to an ingenious type of tubeless semi-flash boiler which has been devised by Mr. G. R. Steward, M.Inst.M.E., of 28, Victoria Street, Westminster, a gentleman who has had a long experience of engineering work, and more especially in the marine branch, he having been connected with Messrs. J. Penn and Sons, of Greenwich, and later on his own account as an engineer and shipbuilder at Blackwall. During the past twelve months Mr. Steward has been busily engaged in perfecting the boiler, which has recently been submitted to a series of trials, when some noteworthy results were attained. The distinctive features of the generator are the entire absence of the tubes, which usually are the cause of considerable trouble, and of the usual crown plate. As will be seen from the sectional view, Fig. 2, the boiler consists of a number of hollow concentric cones which form annular water spaces, connected together by pipes *g*, which form the steam and waterways. The spaces between the cones form combustion chambers, and thus—with the exception of the outer shell—the water spaces are heated on both of their sides. The main feed to the boiler is carried in at the bottom, and is collected from the special reservoir at the top of the generator. It will be noticed that the water column in each cone shows a distinct thinning away towards the water level, this being done with the object of presenting a larger heating surface for the same volume of water at this part where the temperature of the gases is lower. In order to keep the water at a constant level a special reservoir or water belt is provided, this being fixed to the outer shell or casing, communication being made by small perforations at the bottom of the reservoir for the water to pass into the boiler, there being similar perforations at the top for the steam to pass out. At the bottom of this reservoir is a circular perforated pipe 2, supplied with live steam from the central super-

Fig. 1.—General View of Steward's Tubeless Semi-Flash Boiler.

heater, by means of which the boiler is fed with water at a temperature somewhere near the boiling point. It will be observed that the cones have a varying height, this design having been adopted with the double object of giving freedom to the gases at the bottom ends of the several cones, and also of securing an increasing steam space to the central cone previous to the steam entering the superheater. The latter is placed inside the central cone, and, in order to protect the superheater tube from extreme heat while raising steam, it can be filled with water up to the water level through a tube connected with outer cone *f*. The tube then forms part of the generator, but when sufficient steam is raised it is closed

against the water, and performs the function of the super-heater. It should be mentioned that the cones also vary in height at the bottom so as to facilitate the draining of the water which passes from the central cone to the next cone, and from that to the outer annular space, where all the water can be discharged through the drain cock at the bottom. The boiler is stated to

Fig. 2.—Sectional Elevation of Steward's Tubeless Semi-Flash Boiler.

be practically primeless, it being claimed that the circular pipes at the top of the two outer cones prevent water being carried over, and any that is carried over is converted into steam on reaching the superheater.

In the course of some recent tests, in which the heat was furnished by a paraffin burner of the old Bunsen type, starting with the boiler quite cold, the first indication of steam was recorded within 2½ min. of lighting up, while the gauge registered a pressure of 150 lbs. in 6½ min. In order to maintain this pressure the two main steam cocks were opened full and cold water was pumped into the boiler and the pressure maintained with but slight variation. The temperature at the top of the flues in the uptake appeared to run high, averaging between 600 deg. and 700 deg. F., and the superheated steam between 500 deg. and 600 deg. F. The boiler, which can be adapted to use either solid or liquid fuel, occupies a relatively small space, which, combined with its quick steam raising capabilities, renders it well adapted for use on pleasure or industrial steam vehicles.

ARGYLL MOTORS, LTD., have secured an order for a 14-16-h.p. 30 cwt. van from the Gas Department of the Glasgow Corporation.

IN the election for the Leuchars Division of the Fife County Council the motor-car question is being discussed, one of the candidates advocating the tarring of roads at the expense of the motoring community.

THE Leaborne Manufacturing Company, of Greenhill Parade, Harrow, have opened the largest motor garage in the district, and can undertake lathe work up to 24 in. diameter, as well as H.F. vulcanising. A stock of tyres is kept. The building has a commanding frontage of 120 ft. on the main Pinner road, and is open day and night.

SOME idea of the activity of Mr. J. E. Hutton, as well as his success as a sporting motorist, is to be gleaned from the pamphlet just issued by Messrs. J. E. Hutton, Ltd., giving an account of the performances in which the Berliet car has been distinguished at various club competitions, as well as in other contests during the year now closing.

CONTINENTAL NOTES.

Anti-Automobile Movement in Switzerland.

A good deal of antipathy is still being shown to motor-cars in Switzerland; in the Canton Grisons their use has been forbidden, while now a demand has been made by the Grand Conseil of Zurich for more severe measures against motor traffic for the protection of the public. The Government has replied that it is impossible to prevent such vehicles being used, but it is possible that an increase in the taxes on the same will be made.

The Training of Motor Repairers.

The Automobile Technical Association of Vienna is organising a training school for motor repair work in the rooms of the Handicrafts Exhibition. It is especially intended for country blacksmiths, locksmiths, and other mechanics with a knowledge of machinery, and besides helping to provide automobile repair shops in country places the school will open up a new means of livelihood to these workmen, many of whom have, it is stated, lost a good deal of their original business through the introduction of automobiles. The school will be completely equipped with tools and all requisites for the repair of cars. The course of instruction will last four weeks, and special provision is to be made for the admission of workmen in poor circumstances by the grant of a small pecuniary compensation for the time spent in the school.

The Paris Salon.

At the last meeting of the French Chambre Syndicale de l'Automobile the question as to the future of the Paris Salon was raised. Some members of the society hold that an annual exhibition puts them to too much expense in view of the results achieved, and that the interest of the buying public is also diminishing. An exhibition every second year would, according to them, be quite sufficient for all the purposes of the trade, and some are even of opinion that an automobile show every four or five years would be still better. La Chambre Syndicale is determined to thresh out the matter thoroughly, and a circular letter is being drawn up submitting a number of questions on the subject to the many firms engaged in the motor-car and allied industries in France.

Speed Trials at Toulon.

A series of flying kilometre speed trials were held on the La Crau road, near Toulon, on Sunday last. In the single-cylinder class the best time was made by Popham on a Sizaire-Naudin, who covered the kilometre in 1 min. 12.5 sec. In the four-cylinder car section, between 91 and 100 mm. bore, Mouren on a La Buire was the victor in 42 sec., while the fastest time, 39.25 sec., of the day went to the credit of M. Mery, on a Lorraine-Dietrich.

Instructing the Children.

The Automobile Club du Rhone has, with the approval of the local educational authorities, just taken a step which it is hoped will have beneficial results. The departure in question is the drawing up of a notice which is to be posted up in all of the schools in Lyons, warning the children not to throw stones at motor-cars, to pay particular attention to automobile and tramway traffic, and not to cross the roads in front of vehicles. The masters of the schools are also to occasionally give the scholars verbal warning.

French Motor-Car Imports and Exports.

The imports of foreign motor-cars and parts into France during the ten months ending with October last attained a value of £287,280, an increase of £4,000 over the corresponding ten months of 1906. During the same periods the exports of motor-cars and parts from France advanced from £4,572,120 to £4,824,440.

Motor Ambulances for Brazil.

The municipal authorities of Rio Janeiro, Brazil, have lately ordered from the De Dietrich Company four special vehicles designed for use as ambulances, and also for the

transport of police officials. The machines, which will be of 16-20-h.p., will be fitted with closed bodies, having accommodation for twelve persons and a stretcher, as well as a first-aid equipment.

The Two-Cycle Engine Competition.

The Technical Committee of the A.C.F. has awarded the first prize in the recent competition of two-cycle petrol motors to the engine entered by the Peugeot-Tony Huber firm, and the second prize to that of M. René Legros, of Fecamp.

The Coupe de la Presse.

At a meeting of the Competitions Committee of the A.C.F. last week it was decided to again hold the Coupe de la Presse contest in the first week of August, 1908. The rules will be practically the same, except that the permitted weight of the cars will be 1,750 kilograms, as against 1,650 kilograms this year. The feature of the event, which consists of a race over a distance of about 400 kilometres, is that it is run on a petrol allowance basis of 19 litres per 100 kilometres, equal to about 15 miles to the gallon.

The Nice Automobile Week.

The programme of the annual automobile week at Nice has been provisionally drawn up as follows:—March 22nd, Auto-

One of the cars used in the recent Military Manoeuvres in Italy.
L'Automobilista.

mobile Flower Fete; March 23rd and 24th, Touring Contest; March 25th, Elegance Competition at Monte Carlo; March 29th, the Kilometre Bull's Eye Event; and March 31st, an automobile paper chase.

Miscellaneous Items.

Captain Renaud read a paper on Industrial Motor Vehicles at a meeting this week of the Automobile Club Seine-et-Oise. —The Automobile Club d'Ostende et du Littoral has just been formed in Ostend, with Count Henri Visart de Bocarmé as first president. —A company has just been formed to introduce a service of taximeter cabs in the town of Lille. —The Grosser Berliner Omnibus Gesellschaft has lately put a Stoltz single-deck steam omnibus in service. —The "Auto's" concours de pannes has again been postponed, but is to be definitely held on Sunday next, the 15th inst. —Messrs. Renault Freres have presented a 14-h.p. four-cylinder engine to the testing laboratory of the French Automobile Club. —The Austrian Automobile Club is preparing to celebrate the completion of its tenth year of existence on the 6th February next. —A company is being formed in Landser, Alsace, to establish a public motor-car service between Muhlhausen, Obersteinbrunn, and Habsheim. —The Marchese Ferrero di Vintimiglia has been elected president of the Italian Automobile Club in place of the deceased Prince Strozzi.

Motor Vehicles for Military Purposes.

The above illustration depicts the Gun of the Armoured Motor-vehicle belonging to the Austrian War Office in course of trial during the recent military manoeuvres in Austrian Silesia.

[Allgemeine Automobil Zeitung.]

As will be seen from our Lighting-up Time Table, the times of illuminating motor-cars will gradually extend after next week.

WITH the exception of one man who is under the control of the North-Eastern Automobile Association, the whole of the road agents of the Motor Union have been withdrawn from duty.

At the Paris Salon President Fallieres was greatly impressed by the cord-laying machine on the Palmer Tyre Company's stand,

which was one of the features of the show. The principle of the well-known cord tyre was carefully explained to the President, and the remarkably ingenious piece of mechanism, now so familiar to the majority of motorists on this side of the Channel, satisfactorily performed the cord-laying process in his presence. The King of Greece also was deeply interested in the machine, and stayed for quite a long time at the Palmer stand. The first public performance of cord tyres in France has been received with acclamation by public and Press alike, and it is evident that Palmers will receive a large share of future tyre business over there.

THE L.G.B. regulation as to the speed of motor-cars being reduced to ten miles per hour over that portion of the main road from London to Brighton which passes through Handcross, between the milestones indicating thirty-three and thirty-four miles from London, comes into force to-day (Saturday).

THE "Industrial Motor Review" for December contains practical articles with regard to the running of motor-vehicles for the transport of goods, including statements of actual costs and running expenses. There is also a complete review of the motor-vehicles, tractors, &c., at the Smithfield Show, and an important paper on the organisation and management of a public service garage.

MR. HENRY MOORE sends us a photograph of his new garage in the Regency Mews, Preston Street, Brighton. This is within 200 yards of the Hotel Metropole, and is composed entirely of private lock-up compartments evidently of ample proportions for large touring cars. In the front of each lock-up is a washing ground, a separate hose being supplied for every vehicle, thus avoiding delay in getting the cars ready for the road. A chauffeurs' room has also been provided. The firm of Moore of Brighton, Ltd., have also erected a similar garage in Norton Mews, Hove, constructed on equally good lines.

A JAPANESE company has lately commenced to manufacture motor-cars in a small way in Tokio. The first vehicle was completed a few weeks ago, and it is claimed that every part was built in Japan, with the exception of the tyres, lamps, springs and coil. The car is more on American lines than English, being fitted with a 12-h.p. engine located at about the centre of the frame under the body,

MESSRS. ARCHIBALD GRAY AND Co., of High Street, and Quarry Hill, Guildford, have been appointed official repairers to the Royal A.C.

AT 18, Charing Cross Road, W.C., in a fine position opposite the offices of the M.C.J., are premises with a total floor area of 23,000 square feet, which are unlet. They are admirably adapted for the purposes of an automobile showroom.

MRS. A. E. PERKINS, of Okehampton Road, Kensal Rise, N.W., has won the motor-car offered by Messrs. Lipton in connection with their recent Limerick competition.

A MOTOR-CAR containing an American bride *en route* to St. George's Church, Hanover Square, W., on Tuesday broke down and nearly led to the postponement of the wedding.

MR. W. H. DOREY, of 14, Rue Torricelli, Paris, informs us that he has been appointed sole foreign agent for the new Vacuum silencer, illustrated in the M.C.J. of the 30th ult.

ON Sunday next a general rearrangement of fares by the various motor-bus companies in London will be inaugurated, and many of the stages of the penny fares will be considerably reduced.

AMONGST the candidates at the most recent examination of the Royal A.C. were several motor-bus drivers from the Motor Schools, Ltd. In the event of success in the examination, they will be employed by the Vanguard Company.

AT last week's meeting of the Insurance Institute of Ireland, held at Dublin, Mr. Llewellyn Meredith, of the International Insurance Company, read a paper on motor vehicle insurance, in the course of which he described the general development of the motor-car industry.

MESSRS. GAMAGE'S Sportsman's Pocket Diary for 1908 consists of nearly 200 gilt-edged pages, on good thin bank paper, and well bound. It is less than a quarter of an inch in thickness; sixty-four of its pages contain useful tables, charts, and information of sports and pastimes; there are also memoranda pages, well arranged cash account pages and a section for recording cost of motor-car maintenance. It is also fitted with a patent self-opening memo tablet and pencil, and contains a free £1,000 insurance policy.

THE accompanying illustration shows an 18-24-h.p. Fiat car, which has recently been supplied to the order of the Crown Agents for the Colonies for the personal use of Sir William Taylor, the Resident General in the Federated Malay States. The Roi des Belges body is painted dark green with white lines, the

upholstery being to match; and it is interesting to note that it has been built at the Fiat Company's Motor Body Building Department at Brighton. Special attention has been paid to rendering the car thoroughly suitable for use abroad; and with this object in view all four wheels are shod with Moseley Perfect Detachable tyres of uniform size, 36 by 5 inches.

SEVEN motor-cars of different makes are now available for hire at Messrs. Randall's motor depot, in the High Street, Andover. The firm have a garage in the White Hart Hotel yard, and have also a motor establishment at Ludgershall, Wilts.

THE Irish A.C. is about to put up 200 danger posts and signs in various parts of the Emerald Isle.

MR. G. B. GENTLE, Chief Constable of Brighton, has been elected an honorary member of the Royal A.C.

THE Erie (U.S.A.) Motor Club is awarding prizes to the road supervisors in the district for the best kept stretches of roads.

COMMODIOUS premises at 14, Corporation Road, Newport, Mon., have been opened by Mr. F. Turner, of the Alexander Motor and Cycle Works.

AT Brisbane, Messrs. Howard and Co. are extending their show-room capacity to meet the colonial demands for the Rover and Reo cars, their agencies for which have proved extremely popular.

Elsewhere in the present issue we conclude the publication of an interesting article describing a motor tour in Brittany, one of the most picturesque districts of France. It is from the pen of Mr. Francis Miltoun, and first appeared in our American contemporary, "The Automobile."

THE Jones Speedometer Company, of New York, have recently introduced a speed-control governor which enables the occupants of the closed portion of a motor-car to limit the speed of the vehicle at will. The apparatus consists of four elements—A, a speedometer provided with contacts at certain points; B, a circuit-breaker acting on the ignition; C, a speed-control dial; and, lastly, a source of current (dry cells). C is placed in the rear portion of the vehicle, while B may be conveniently placed anywhere in the ignition circuit. The pointer on C being

placed at any figure—10, 15, 20, 25, or 30 miles per hour—when the indicating finger of the speedometer reaches the corresponding figure current from the battery cells passes through the circuit and energises the electro magnets in B, causing them to attract an armature which breaks the engine ignition circuit. When the speed falls below the set figure the armature is demagnetised and the ignition circuit is again completed. An arrangement of the apparatus to act on the throttle instead of on the ignition is also being manufactured. Messrs. Markt and Co., 6, City Road, E.C., are the agents for the Jones Company in this country.

ON Tuesday Mr. W. T. Clifford Earp set up four new records on the Brooklands Track on his 60-h.p. six cylinder Thames car, viz.—Fifty miles, 39 min. 10.29 sec.; one hour, 76 miles 453 yards; 150 miles, 1 hour 58 min. 34.1 sec.; two hours, 151 miles 146.8 yards.

FROM the Touring Club of Italy come copies of four additions to the excellent series of maps of Italian roads they are publishing; they deal respectively with the Rome, Naples, Civita Vecchia and Frosinone districts, and will be found useful to all who contemplate a tour by road in Italy.

REPAIRS to motor tubes can be very neatly finished by coating the repairs with a special colouring cement before vulcanising. A preparation for this purpose has just been introduced by Messrs. Harvey Frost and Co., Ltd. This secures the repair being made invisible after execution, the colour or tint of the repair being identical with the hue of the tube. The new material is known as the H.F. Red Colouring Cement.

THE Milo Motor and Engineering Company have good facilities for motor repair work at their establishment in the High Road, Chadwell Heath, Essex.

IN the Tangye motor-car jack, which is being marketed by the United Motor Industries, Ltd., the driving worm is provided with a sliding as well as a rotary motion. It is specially designed for use with vehicles weighing up to 35 cwt.

THE Elastes Company, Ltd., have issued a pamphlet giving extracts from the many letters of appreciation they have received. These testify to the good results that have followed the adoption of Elastes by many motorists who have given the preparation a thorough test on roads of all descriptions.

IT is noteworthy that a commencement has been made in France in the way of a return to the old form of sloping engine bonnet, there being several new cars on view at the recent *Salon* in which the shape adopted is similar to that made familiar during recent years by the Renault and C.G.V. firms.

A HANDY Guide to the interesting Cannock Chase district, especially designed for the use of motorists, has been issued from the Shrewsbury Arms Hotel at Rugeley. This hotel has a well-equipped garage, and the value of the Guide is increased by the table of the principal routes passing through the town, with the mileages to important districts beyond.

MESSRS. PERRY, THORNTON, AND SCHRIEBER, the British Agents for the Ford cars, have sent us a copy of the booklet they have prepared, giving full instructions how to remove any part of these cars from the frame should they need repair, and the best method of effecting the same when necessary. Hints are also given as to methods of adjustment and inspection, while a few pages are devoted to notes on some of the common sources of trouble to which all motor vehicles are subject. The booklet also contains a full price-list of spare parts for the 15-18-h.p. Ford car; these are all numbered, and the majority illustrated, so that users will be able to obtain duplicates with a minimum of trouble. Altogether the list is one which will prove indispensable to users of these vehicles, and will also be found to contain much that should prove useful to motor-car repairers.

HAVING realised that there is a demand for small motors of substantial design which can be run direct off electric lighting mains without a series resistance, the Crypto Electrical Company, of Bermondsey Street, London, S.E., have just put on the market two machines, of respectively $\frac{1}{4}$ -h.p. and $\frac{1}{2}$ -h.p. which they claim will require a minimum amount of attention, and work for years without costly repairs. The brush holder is of the self-adjusting type, fitted with carbon brushes, the machine running sparklessly from no load to full load without altering the position of the brushes. The armature is of the slotted drum type, and the commutator is built up of hard drawn copper segments assembled under hydraulic pressure. The fields are former wound and taped and can be shunt or series wound. We may add that both sizes of the machine are arranged to work as dynamos when required.

A FEATURE of Messrs. Charles Letts's Diaries which has conduced in no small degree to their great success is the patent self-opening memo. tablet. This is a simple contrivance by means of which the diary always opens at the place in use, whilst memoranda written on the tablet are brought prominently under the eye, and, as soon as attended to, may easily be removed by a moistened rag or sponge. Another feature of Charles Letts's Diaries is the £1,000 accident insurance coupon. Over £8,000 has been paid in claims resulting from recent railway and other accidents. An entirely new series of householders' combination insurances is for the first time included in the 1908 diaries. To the details of production the greatest care is given; the papers are really good, the ruling and printing are evidently carried out by most accurate machinery, the perfect register and evenness of the work being a marked feature. In the binding, silk is used for sewing the pocket diaries in preference to thread, equal strength and much greater neatness being secured. The diaries also include those for the office desk, others devised so that the space for one week appears at an opening, and others specially prepared for commercial service. Altogether, the Charles Letts Diaries well maintain their old reputation.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE BROOKLANDS FATAL ACCIDENT.

AN APOLOGY.

IN our issue of October 5th, 1907, we printed a letter from a correspondent who criticised the driving of Mr. Sydney Smith in the race in which Mr. Hermon was killed.

We desire to express our great regret to Mr. Sydney Smith for having allowed the letter to appear in our columns, and we offer him our sincere apologies for any possible annoyance which its publication may have caused, and we unreservedly withdraw the letter. Mr. Sydney Smith is a motor driver of great skill and experience, and there was no foundation in fact for the suggestion of our correspondent that his management of his car was a cause of the accident, or that he was in any way negligent upon the unfortunate occasion in question. We hope that Mr. Sydney Smith will accept this as a full apology, and we shall be happy, if he desires it, to insert any further statement on the matter.

CORDINGLEY & Co.

ALCOHOL TESTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Again we have Mr. Edge experimenting for the benefit of motorists in general by carrying out tests, the results of which he gives in his letter published in a recent issue.

manufacturing centre. For instance, suppose the manufacture were conducted at Silvertown, the price would be about 4d. per gallon less than the present price of petrol to the retailers in the London district. Surely such a state of things is worth a very big effort on the part of motorists. And the other advantages of such an indigenous supply of fuel, are they not written in the report of the Fuels Committee?

Going back to Mr. Edge's experiments, I should like to know whether he adjusted the float to compensate for the increased specific gravity of the fuel, otherwise, of course, his jet level would be so low that starting would be weary work.

Personally, I think the success of alcohol-benzole fuel, at a reasonable price, will depend upon whether it can be substituted for petrol on existing engines without any permanent or drastic alteration to carburettor or compression, so that if you run out of alcohol-benzole in the country, and you cannot get a further supply, you simply put petrol into your tank and *vice versa*.

With a little ingenuity surely some mechanism could be arranged, so that if alcohol-benzole were substituted for petrol, a small calibrated weight could be dropped on the float to increase its specific gravity. And as to compression, some mechanical device could, I think, be introduced to vary this in the manner that I do it at present, but, of course, more expeditiously, viz., in my valve pockets I have cups screwed in with about $\frac{1}{2}$ in. depth of thread. If I wish to reduce my compression, for the one copper and asbestos washer I substitute two, having between them a faced iron ring of the required depth, thus the cups are raised out of the valve pockets, and the compression reduced. The compression

Some Trials with a Saurer 30-h.p. Single-deck Motor-Bus Have lately been made in the mountainous districts of the Southern Tyrol. The above illustrations depict the vehicle near the summit of the Pordoljoch, 7,380 ft. above sea level, and on the Rolle Pass, 6,500 ft. [*Allgemeine Automobil Zeitung*].

After the publishing of the Fuels Committee Report, I had hoped to see some official body conduct tests on a mixture of alcohol and benzole, and in my evidence before that committee I strongly advocated the trial of such a combination. However, as no steps had apparently been taken in this direction, I determined to commence the work myself, and had already fixed a separate calibrated full tank, with gauge glass, on my dash for this purpose, when, as so frequently happens, Mr. Edge "got there first."

Until we can put before the authorities some practical results, we cannot expect them to seriously consider the amendment of the Excise duty to the end that we may have cheap alcohol as a fuel, and, therefore, Mr. Edge deserves our thanks for his initiative. Suppose there was no Excise duty on alcohol for fuel purposes, at once the manufacture of this spirit from peat, sawdust, &c., would become a great industry in this country, and 90 per cent. alcohol could be sold wholesale in bulk, with a good margin of profit, at 3d. per gallon. (I am taking here the figures of Sir William Ramsay and Mr. Thomas Tyrer.) At the same time an impetus would be given to the installation of plant for the recovery of benzol from coke ovens, and I think, having in view the evidence that Mr. Ledoux gave before the Fuels Committee, that 8d. per gallon would be a fair price at which to put the benzole in wholesale quantities, with a fair margin of profit. Now I have reason to believe that if the carburettor level be adjusted to suit the specific gravity of the mixture, two parts of alcohol and one part of benzole can be used with satisfactory results. The wholesale cost of such mixture would be under 5d. per gallon, and allowing 2d. for expenses connected with the packing in two gallon tins, and delivery within twenty miles, it brings us to 7d. per gallon as the wholesale price to the retailer within that radius of the

can be increased above its normal by using a somewhat deeper cup, but, of course, care has to be taken to give the valve clearance.—Yours truly,

A. DUCKHAM.

THE HORSE-POWER OF PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For the last few years I have called attention, shortly after the Show, to the curious want of uniformity in the horse-powers applied to various sized engines by their respective makers. Some few years back I wrote an article for one of the motoring papers, dealing with an attempt to obtain a unit upon which to base a rating of horse powers of engines. I failed, but in the course of the argument contained in that article I was instrumental, I believe, in doing away with the formula which accepted revolutions per minute as one of the necessities for rating horse-powers. Shortly after that article, practically every club in Europe did away with the old formula which included "revolutions per minute." I trust my perseverance, I might call it my annual perseverance, may one day result in the unit being established by which the public may compare what they are purchasing.

The Royal Automobile Club have a formula which is not a bad one, and yet is not a good one. The French have a formula of litre measurement, of which I personally approve, but I should like to repeat the same remarks that I have often applied before, "the unit that may be used for rating an engine is immaterial so long as it is kept within reasonable limits, subject to every manufacturer being forced to use the same unit." If the Royal Automobile Club were to think fit, it might impose upon all those firms a stringent rule to catalogue the horse-

powers of the engines under the club rating, under the penalty of refusing to permit any car to enter races when the manufacturers did not apply the denomination given according to the club rating. I do not wish it to be thrown at me that I am not practising what I am preaching. I admit it; but, so long as everyone is permitted to do as he or they think fit, then those who are desirous of accepting a standard must not be blamed for following the bad example.

To impress upon your readers the peculiar state of the present position, I will, with your permission, cite a few extraordinary cases, showing how the catalogues of the various makers are apt to deceive purchasers into misunderstandings which in all probability the manufacturers do not desire, but which, notwithstanding, exist. The Nordenfelt, De Dietrich, Itala, Weigel and Spa of 130 mm. bore are all termed in their respective catalogues 40-h.p. The Renault with, exactly the same bore, is called 35-h.p. The Mercedes, with 10 mm. less bore, is called 5-h.p. more, or it is called 10-h.p. more than the Renault, notwithstanding that it is 10 mm. less bore than any of them. Exactly the same thing applies to the 40-h.p. Benz car. This is 10 mm. less bore than the first mentioned cars, but it is denominated 40-h.p., or exactly the same. The 40-h.p. Westinghouse is 10 mm. less bore than the Itala, Weigel, Spa, &c., but it is denominated the same. It is exactly the same bore as the 45-h.p. Mercedes, but it is denominated 5-h.p. less.

Taking the reverse side of the picture, we find that the Rochet-Schneider is 10 mm. more than the Weigel, Itala, Spa, &c., but it is called the same. It is 15 mm. more than the Mercedes, Austin, Benz, &c., but it is called 5-h.p. less than the first named, and the same as the cars following.

I will now deal with smaller cars, where the results are still more extraordinary. A 20-h.p. Charron is 10 mm. bigger in bore than a 28-h.p. Pipe. The Porthos has exactly the same bore as the Charron,

The 20-25-h.p. West-Aster Car, with bodywork by Messrs. A. Meier and Son, Redhill, which has lately been supplied to the Right Hon. Viscount Powerscourt, of Ireland.

but is called 4-h.p. more, and the Weigel 25-h.p. car has exactly the same bore as both the Porthos and the Charron, and is called 1-h.p. more than one, and 5-h.p. more than the other. The 25-h.p. Weigel with 110 mm. bore is denominated 1-h.p. less than the Metallurgique which is denominated 26-h.p. with 4 mm. less bore. The 25-h.p. Gladiator is 5 mm. less than the 20-h.p. Spyker, or the 25-h.p. Weigel, the 20-h.p. De Dietrich, or the 25-h.p. Straker-Squire. The 26-h.p. Talbot is 5 mm. less than cars denominated by the same h.p., such as the Straker-Squire, Swift, &c., but the 25-h.p. Brown is 10 mm. less than cars mentioned above.

It will be impossible to give a proper set of examples in any letter, but there is sufficient written above to make one wonder how the uninitiated buying public, the greater part of whom do not profess to have any technical knowledge, is able to discriminate between one car and the other. He buys a vehicle with, let us say, 100 mm. bore, and believes, according to the catalogue that he has, let us say, a 25-h.p. car. He meets a friend who has also purchased a new car, and his friend with envy says "How lucky you are. I could not have invested in so high a h.p. car as yours. Mine is only 15-h.p." On examination it is found that the gentleman who could not afford to buy the alleged higher-powered car has an engine with perhaps 10 mm. more bore. His envy is turned to scorn and he thinks his friend has been swindled. I do not wish to suggest that he is swindled, or that the bigger the bore, the bigger results. There is much that depends upon the knowledge of the manufacturer. But all this is unknown to the purchaser, he judges by the size of the engine in the day of his initiation into the mysteries of motoring, the same as he judges his purchase by the pure £ s. d. There is not the slightest doubt that the honour of the motor industry is often called into question by the curious want of uniformity in the

description of the goods sold by different firms, and I think it would be adding materially to the confidence the public place in the trade generally, if means were obtained by which, in defining the h.p., a method of comparison existed. It would certainly add to the life of the salesman who is bombarded by questions as to why a small engine denominated by a higher h.p. is more powerful than a bigger engine denominated by a smaller h.p. It would equally save him the necessity of entering into many false explanations which are made, firstly to sell his goods, and secondly because as a rule the salesman knows as little about the matter as the purchaser.

I am equally convinced that every firm of note and standing in this country would be happy to see some method adopted to bring to an end the present state of things, and I have very little doubt that if either the Royal Automobile Club or the Society of Motor Manufacturers were to take the matter up with their foreign correspondents, some means could be obtained for universal rating, which should be enforced upon manufacturers under some penalty which one of these bodies may have at their command.—Yours truly,

D. M. WEIGEL.

THE WORLD'S RECORD FOR RELIABILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I agree with Captain Corbet that it is unfortunate that there should have been differences between Rolls-Royce, Ltd., and the London and Parisian Motor Company, Ltd., concerning the results of the trials of 15,000 miles of the Hotchkiss and Rolls-Royce cars. I ventured to state that I thought there had been a clerical error in the pronouncement by the Royal Automobile Club that the "reliability" of a car relates to the amount of time spent in adjustments and replacements to keep it running on the road. Captain Corbet and your readers may be interested to know that this extraordinary definition has now been withdrawn by the R.A.C.

So long as the R.A.C. permits it, Captain Corbet, as a business man, is perfectly within his rights in claiming as a merit for the Hotchkiss car the fact that only 6 min. 40 sec. per day were spent in its adjustment in the motor-house as compared with 28½ min. per day spent in adjustment to the Rolls-Royce car. But since this claim would appear to be made in order to persuade people that the Hotchkiss car should therefore be bought in preference to the Rolls-Royce car, I must, so long as the claim is repeated, remind the public that economy in time spent on adjustments can only be justified provided that other records show that no further adjustment was necessary, or could be of benefit. If the R.A.C. were not to permit partial statements to be made, we should, I think, find that Captain Corbet would quickly cease to claim economy in adjustment as a merit, since comparative figures would show that whereas the additional time spent in the adjustment of the Rolls-Royce as compared with the Hotchkiss was of a value of only £3 6s. 1d., the value of the fuel required to propel the Hotchkiss over 15,000 miles was £127 5s. 2d. as against the Rolls-Royce £62 10s., or a difference of £64 15s. 2d.

In thanking you for the courtesy you have extended to us in allowing us to make these statements in your correspondence columns, I would like to assure you that we do not propose to encroach upon your valuable space any further in connection with this matter.—Yours truly,

C. JOHNSON.

[This correspondence is now closed.]

ADJUSTING VALVE GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In re-assembling a motor which has been taken apart how should one proceed to adjust the valve cam gearing so that the exhaust valve will be lifted at the correct point in the stroke of the piston? Any information you or any readers of the *M.C.J.* can give me on the point will be esteemed by—Yours truly,

R. APPLETON.

[Replying to our correspondent, in the first instance it is necessary to determine the direction the engine has to run (as this depends entirely on the valve setting), after which it will be necessary to ascertain the position of the piston in the cylinder. This can usually be done by putting a small rod through the compression tap, or still better by removing the same. Now to set the exhaust valve: turn the engine slowly round in the direction it has to run, until the piston is about an inch from the bottom of the downward stroke, the exhaust valve should then be set to commence to lift; after putting the cam in this position slowly turn the engine round until the piston has completed its upward stroke, when the valve should be fully closed. If this is not so, but it still remains open, the cam should be shifted back a tooth and again tried. If this is carefully followed our correspondent will have no difficulty in getting his engine to run satisfactorily.]

THE VALUE OF THE DRIVER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Reading many references to the Industrial Vehicle Trial, I have been struck with the several references to drivers, the critical notes of correspondents being somewhat pronounced. In perusing the articles I have wondered whether the drivers of the motor-van sent out in delivery work are always as well equipped for their business

as they should be. Often firms take up the motor-van, and, while considering its points and advantages, entirely overlook the part played by the driver in securing its efficient running under varying conditions. The driver, too, should have attention, so that habits of carelessness are checked and every encouragement given to him to run the vehicle with as little wear and tear as possible. It has occurred to me that in this particular way the columns of the Journal may be useful in giving hints and suggestions that owners of motor vehicles, whether used for business or pleasure, can place before the men who drive these vans.

Fortunately in the development of the commercial vehicle we shall be spared one of the drawbacks that occur in connection with the pleasure car, and there will be no room for the man to drive a car, do odd jobs, and a bit of gardening. Drivers of mechanically-propelled vehicles for business purposes will be able to keep to their vehicles, with the result, it is to be hoped, that they will quickly begin to realise their peculiarities and requirements.—Yours truly,

A RIDER.

ARE TWO IGNITIONS NECESSARY?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed at the recent exhibition that many of the cars are now fitted with two systems of ignition, usually a high tension magneto and coil and accumulator. In view of the high degree of reliability now attained by the former the question naturally arises as to whether the advantage gained is sufficient to pay the added cost of equipment, and whether the so-called double ignition really proves in practice to provide the actual duplicate system it promises.

On this point there is reason for grave doubts. For where two sets of sparking plugs are used, the idle set, being constantly exposed to the

has to be in good pulling order to go up on the first. I thought of taking out the engine and putting in a 9-h.p. or 12-h.p. Daimler engine. Would the fly-wheel come in line with my present clutch, and would these engines fit into the present inside frame, or would I require to put in a new gear-box? I want no more speed on the level, but I want to get up this hill faster.—Yours truly,

SLOW COACH.

[The best thing that "Slow Coach" can do to get more power, without going to the expense of an entirely new engine, is to obtain a larger pair of cylinders and pistons from Mr. Frank Morris, of King's Lynn, who has made a speciality of old Daimler rejuvenating for some years. He also has a method of renewing the gear sleeves economically. The fitting of an entirely new engine of 12-h.p. to this old car would probably cost "Slow Coach" as much as he could pick up a complete second-hand vehicle of that power for, and we think he would, on the whole, regret the outlay.]

AN OPTICAL ILLUSION?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Watching the wheels of motor-cars when passing by we often observe the spokes hesitate, or apparently stop, for the fraction of a second, and then spin on again. This is clearest, of course, when the wheels are painted a light colour. I presume it is an ocular illusion, but should be greatly obliged to be furnished with a reference where an explanation may be found.—Yours truly,

J 77.

[A wheel may be considered as a series of levers of the second order, which radiate from a common centre. The ground is the fulcrum, and as each spoke is brought vertical with the ground under the hub it actually

Two of the Competing Lorries—a Suddutsche Fabrik and a Bussing—in the recent German Industrial Vehicle Trials.

[Allgemeine Automobil Zeitung, Berlin.]

play of oil and soot in the cylinders without the clarifying influence of the spark, is liable to foul, and in road service generally is found to be out of order when its services are required. This being the case, the process of changing from one set of ignition to the other involves more than the simple movement of the switch. In fact, it usually involves the removal and cleaning of one or more of the plugs which have been standing idle. Where a single set of plugs is used with two possible sources of primary current, on the other hand, no such difficulty exists. Plug trouble is discernable at once, since the same sort of failure developed with one source holds good when the other is tried. A brief test at the terminal connections on the engine, or on the coil, is then sufficient to locate the seat of any trouble which may arise. Hence, all things considered, the double plug system may be considered as not being altogether advantageous, and indeed superfluous.

As to the question of reliability, several years' use of the high tension magneto has given ample assurance of the suitability of the arrangement for continuous and rigorous service. Its suitability may no longer be questioned. The additional security of the double system, while considerable, would hardly seem to be sufficient to compensate for the cost of equipment, except in such cases, as already mentioned, where economy is not a material consideration.—Yours truly,

J. WORTHINGTON.

A DAIMLER CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if you or any reader of the *M.C.J.* could give me the following information. I have a 6-h.p. Daimler car in public service which carries eight passengers, and runs at twelve miles per hour. I find that when the roads are heavy I cannot get the car to take the fourth speed. There is a very stiff hill on the road, and the car

(as well as apparently) does stop for the fraction of a second. The spoke which is travelling the fastest is that at the top of the wheel, and the others vary proportionately to their relative positions in the series as to their speed at any given moment. Therefore we think that what "J 77" notices can hardly be classed as a delusion. The hesitating effect he describes may possibly be due to the various impressions received by the retina of the eye, in much the same manner that "living pictures" are obtained by rapidly following photographs. Doubtless light-coloured spokes would augment the effect, and perhaps also, in certain positions of the observer in relation to the vehicle (as, for instance, when it is turning a corner, and he can see the wheel remote from him through the spokes of that near him), the illusion may be intensified. For here, owing to the differential coming into play, one wheel over-runs the other in proportion to the obliquity of the turning movement. There is a book entitled "Paradoxes of Nature," which we believe has a reference to optical delusions. This is written in a popular style, and is very interesting generally; but if "J 77" requires a thoroughly scientific explanation, he will probably find it in any standard work on optics.]

C. S. would like to hear of an opportunity for acquiring a knowledge of the motor industry in the North of England.

ONE of the soundest pieces of advice that can be given to a motorist is "Keep your brakes in order." However, this is often very much more easily said than done. On the British and Colonial Daimler-Mercedes the braking system has had special attention paid to it, while the question of adjustment has been carefully thought out. With the idea of being able to take up any wear, however slight, instantly, a thumb-screw is fitted, by means of which the ends of the bands are drawn together.

CLUBS AND ASSOCIATIONS.

ROYAL.

New members of the Royal A.C. include Lord Newborough, Sir Alexander Baird, Bt., Sir Arthur Herbert, K.C.V.O., Lieut.-Col. C. D. Radcliffe, Capt. F. C. L. Symonds, J.P., and Mr. A. H. Leather-Culley, J.P.

Mr. J. M. Gorham having resigned from the committee of the club, Mr. Philip Dawson has been co-opted thereon.

The name "Committee of Public Safety" has been given to the committee which deals with warning signs and kindred matters.

It has been discovered that, when the current retail price of petrol was 1s. 2d. per gall., one of the hotels holding the R.A.C. appointment was charging 1s. 6d. per gall. The name of the hotel has therefore been removed by the Touring Committee from the official list.

THE MOTOR CLUB.

THE committee of the Motor Club have made a reciprocal arrangement with the Crystal Palace Club, by which members of the former club can avail themselves of all the privileges enjoyed by the members of the Palace Club, including free admission to the Palace and grounds. Facilities will be afforded for Motor Club gymkhanas, &c. There is garage accommodation at the Palace.

SOUTHERN.

At the annual dinner of the Southern Motor Club at the Trocadero Restaurant, London, Alderman G. Howlett presided, and, after the

Miss Kitty Gordon in the new 28-h.p. Daimler Car she has lately acquired. The vehicle is painted blue with blue mouldings and fine white lines.

loyal toasts had been honoured, Mr. Allen Vickers made interesting reference to the club events during the past year.

Dr. Hopkins Walters, of Reading, proposed the toast of "The Motor Union," referring to the meeting of the provincial clubs he had convened at Reading in 1903 and which led to the formation of the national organisation. The Union began with only ten clubs and a small membership and now they had nearly 20,000 motorists within their ranks. In reply Mr. Rees Jeffreys spoke of the good work done by the delegates of the affiliated clubs, and claimed that there was plenty of work to be done by each of the motoring societies without clashing with other interests.

Mr. J. W. Orde responded for the visitors, making the interesting announcement that the international congress would probably adopt the R.A.C. formula for future races. Other speakers included Mr. T. W. Staplee Firth and Mr. F. W. Worthy, the Mayor of Battersea.

KENSINGTON.

THE club met at dinner on the 6th inst. at the South Kensington Hotel, the guests of the evening being Mr. and Mrs. C. Molesworth Tuke, of Chiswick House. Covers were laid for fifty-five members and their guests. After dinner, the chairman, Dr. L. C. Dobson, welcomed the club's guests, alluding particularly to their hospitality on the occasion of the gymkhana held last June at Chiswick House. In replying, Mr. Tuke expressed the hope that he would see the club again next year on a similar occasion.

SIR NEVILLE GUNTER is the president of the Society of Automobile Mechanic Drivers, and Mr. G. O. Clarke the acting secretary.

ON Saturday Dr. Ozanne presided at the annual dinner of the Harrogate and District A.C.

CHESHIRE.

THE first annual general meeting of the Cheshire A.C. was held at the Grosvenor Hotel, Chester, on the 2nd inst., Mr. T. H. Jackson, J.P., being in the chair, and amongst those present being Messrs. A. G. Jeans, J.P., G. S. Bonnalie, W. H. S. Oulton, D. Thornthwaite Brown, J. Royston, Col. F. W. Blood, Dr. S. H. Brien, Alfred Tyrer, Dr. Wilkinson, E. Mansfield, Alfred Mansfield, J. H. Burroughs, Col. Mainwaring, Dr. James Taylor, J.P., Jerome Smith, Wm. Jackson and J. Alfred S. Hassall (hon. secretary). The report of the committee on the work of the club during the past season was read and adopted, and the hon. treasurer's statement of accounts was approved.

The Duke of Westminster was re-elected as patron. Mr. T. H. Jackson was re-elected as president. The following vice-presidents were elected:—Lord Mostyn, Hon. Cecil Parker, Sir Watkin W. Wynne, Bart., Messrs. J. S. Harwood Banner, M.P., W. H. Lever, M.P., Harry Barnston, Trevor Boscowen, T. Gibbons Frost, Col. Hamersley, H. W. Hind, J.P., James Moon, J.P., Alder, T. W. Oakshott, J.P., G. H. Robertson, J.P., F. Sellars, J.P., Charles Threfall, J.P., Sir W. B. Forwood, Bart., Mr. J. J. Evans, J.P., Col. Mainwaring and Mr. Fred Harrison, J.P. Mr. A. G. Jeans, J.P., was re-elected chairman.

The following were elected to form the General Executive Committee:—Sir Percy E. Bates, Bart., Messrs. E. L. Billson, Col. F. W. Blood, V.D., D. Thornthwaite Brown, Dr. H. Dawson, J. Arnitt Dear, J.P., W. S. McDowell, Charles McIver, T. D. Oakshott, Dr. H. Laird Pearson, J.P., J. Royston, Jerome L. Smith, J. A. Stephens, Edgar Stevenson, M.D., Alfred Tyrer, Dr. S. Wilkinson, A. G. Wood. Mr. Wm. Jackson was re-elected hon. treasurer, and Mr. J. Alfred S. Hassall was re-elected hon. secretary. Messrs. F. W. Heape and W. K. Poulson were re-elected hon. auditors.

CUMBERLAND MOTOR UNION.

THE Cumberland Motor Union, of which Mr. H. A. P. Mawson, 66, Lowther Street, Carlisle, is the secretary, is keeping a general watch over the interests of motorists as a body in Cumberland, and, so far as they are able, are getting the various local authorities to pay attention to dangerous corners, unrolled metal, &c., as well as to see to the erection of danger posts where necessary. The membership is necessarily very much scattered, but the value of organisation has been amply demonstrated.

LINCOLNSHIRE.

OWING to the large area covered by this club it has been found difficult to arrange for social events to take place during the winter.

The committee is, however, actively taking up the question of the alleged damage to roads by motor traffic, and is instituting enquiries as to the expenditure per mile on the main roads both now and before the advent of motor traffic.

The position created by the severance of the Royal A.C. and the Motor Union will also receive careful consideration, though no action will be taken before the receipt of statements from both bodies of the causes of the split and of their policy for the future. The membership of the club has increased during the present year from 179 to 225.

SHEFFIELD AND HALLAMSHIRE MOTOR CYCLE CLUB.

THE third annual dinner and prize distribution of the Sheffield and Hallamshire Motor Cycle Club was held on the 5th inst. at the Palace Restaurant, Sheffield. There were about 130 ladies and gentlemen present. Mr. J. H. Hall, the president of the club, was in the chair, and among those present were Mr. F. O. Langton, secretary of the Leeds Motor Cycle Club, Leeds; Mr. F. B. Cawood, Sheffield Automobile Club; and Mr. A. Lister, the secretary of the Sheffield Central Cycle and Motor Cycle Club. Apologies were received from Mr. S. W. Carty, Newcastle, and District Club, and Mr. Wilkinson, Lincoln County Club.

After the loyal and other toasts had been honoured, the prizes won by members during the year were distributed, among the recipients being Mrs. J. Haslam, Messrs. R. Penny, W. W. Evers, J. A. Lloyd, J. W. Arden, R. Key, J. H. Hall, W. Watts, S. Sawyer, T. Durant, J. W. Gould, J. Haslam, H. Bisby, W. Hill, H. Mallinder, A. Tarr, A. Charles, O. H. Dudley, T. F. Turner, and W. A. Lister.

During the evening an interesting address was given by the president, Mr. J. H. Hall, who said that motor-cyclists, in common with all other sportsmen, had reason to complain of the weather during the past season. Notwithstanding this, however, the ranks of motor-cyclists in the country had increased from 54,000 to 70,000. He referred at length to the controversy between the Auto-Cycle Club and the Royal A.C., and urged the necessity of a strong motor-cycle union to take a line independent to both bodies referred to. One of the things such a union could usefully look to was the question of the taxation of motors. The car clubs would be too busy looking after their own case to give much attention to motor-cyclists, and if there was any apathy among motor-cyclists in this matter they would have to pay dearly for it. The motor-cycle was already unfairly taxed as compared with the car, and they would do well to have a strong union to look after their interests.

The members of the club have presented their president with a handsome French ormolu clock and ornaments inscribed as follows:—Presented

by members of the Sheffield and Hallamshire M.C.C. to J. H. Hall, Esq., their esteemed president, December 5th, 1907.

YORKSHIRE.

THE Yorkshire A.C., which, together with its branches, boasts of a membership of over 800, has opened its winter session with a successful smoking concert at the Great Northern Victoria Hotel, Bradford. The chair was taken by Mr. E. H. Hepper, of Leeds, who was supported by Mr. G. H. Kent, of Bradford, and a numerous company. An attractive and interesting programme, arranged by Mr. E. E. Faiers, of Bradford, and the club's hon. secretary (Mr. Charles P. Wilson, of Leeds), was contributed to by Messrs. Ernest Eagle, A. G. Hird, F. Samuels, E. Swaine, Bert Boothroyd, H. Haskell, and A. Pearce.

SCOTTISH.

AT the meeting of the General Committee of the Scottish A.C., held at Edinburgh last week, it was reported that applications for speed limits had been lodged by thirteen authorities, and that the Secretary for Scotland had during the year granted permits to reduce the speed of motor-cars at such places as Aberfeldy, Kilmarnock, Forbes, Granton-on-Spey, &c.

It was resolved that no action should be taken with regard to the difficulties arising between the Royal Automobile Club and the Motor Union until the Scottish A.C. is in possession of the proposals from both.

With regard to the trial for 1908, a scheme for co-operation with the R.A.C. was adopted with certain conditions securing the supremacy of the organisation of the club north of the Tweed.

TASMANIA.

A MEETING of those interested in forming a motor-car club has been held at the Tourist Bureau, Hobart. Mr. C. E. Webster was voted to the chair, and the secretary *pro tem.* (Mr. A. Wertheimer) read the minutes of the preliminary meeting held at Messrs. A. G. Webster and Son's offices. The sub-committee to draw up the rules and bye-laws handed in draft of same, and they were adopted. A resolution was carried to the effect that the secretary be instructed to have rules and bye-laws forwarded, with a circular, to persons interested in the movement. Some discussion concerning the election of officers, and also the proposed motor-car traffic regulation Bill, took place.

THE first annual dinner of the Bradford Motor-cycle Club has been held at the head-quarters, the Imperial Hotel, Bradford.

THE Dundee and District Cycle Club have inaugurated their winter session with a smoking concert at the Royal Hotel, Dundee.

THE Hertfordshire County A.C. and the Essex County A.C. held annual dinners on Saturday last. At the former Mr. J. W. Orde announced that the dissolution of partnership between the A.C. and M.U. would be carried out at the end of the year.

UNROLLED STONES ON THE HIGHWAY.

HUBERT M. HARTIGAN, of Calcot Park, Reading, was summoned at Wokingham Court for driving a motor-car on the footpath at Wargrave, on November 20th. P.C. Holloway spoke to seeing Mr. Hartigan drive his motor-car on the footpath in the London Road, Wargrave, for 150 yards. There was a steam-roller at work on the road and there was also a cart there, and the defendant said he could not pass, but witness denied this. Fined 40s. and 5s. 6d. costs.

Motorists have often protested against the dangerous and destructive practice of certain local authorities in leaving unrolled stones extending from kerb to kerb upon the highway, particularly during week-ends. In order to emphasize this protest the Motor Union has taken up a case of the driver of Mr. O'Donnell, M.P., who was summoned for driving on the footpath by the side of the highway on the main road from London to Southampton, near Blackwater, in order to avoid a stretch of broken and loose granite, which, it appeared from the evidence, was left unrolled on the main Southampton road for several days. The summons was heard on the 5th inst. before the Aldershot magistrates. The defendant, Frederick Darby, driver in the employ of Mr. O'Donnell, M.P., was summoned for a breach of Section 72 of the Highway Act, 1835. A policeman proved that a part of the main road from London to Southampton, near Blackwater, was being repaired, and that the steam roller had gone away from the spot for some considerable time. There was a quantity of large rough granite all over the road, and on either side of the road were two footpaths with a small grass edging between the paths and the roadway. The car, in order to avoid the stretch of broken and loose stones, went very slowly along the footpath for a short distance. No foot passenger nor vehicle was anywhere near at the time, and there was no damage done to the path. Mr. Moresby White (instructed by Messrs. Campbell, Hooper and Todd, on behalf of the Motor Union), for the defence, argued that the object of this Section in the Act was to protect the footpath from being damaged and to safeguard foot passengers. When the carriage way was temporarily obstructed, thereby rendering it difficult or dangerous for a vehicle, the traveller had a right in law to utilise any part of the highway, including such portion as might be usually set aside for foot passengers. When a fallen tree totally obstructs the

carriage way, clearly a vehicle had a right to make temporary use of the whole highway, including the foot-path. In any case the alleged offence was so trivial that the Bench ought to exercise their power under the Summary Jurisdiction Act by dealing with the matter without proceeding to a conviction which involved the endorsement of the driver's licence. The magistrates decided to convict, fined the driver 21s. and endorsed his licence. Counsel asked the Bench to state a case for the opinion of the High Court whether this section of the Highway Act was ever intended to include a case such as this, and the application was acceded to.

COMPANY NEWS.

PALMER TYRES.—During the year ended September 30th, 1907, the business of the Palmer Tyre, Limited, expanded in a satisfactory manner. The net profits amounted to £7,700, which compares with only £4,800 for the preceding year. The dividend is maintained at 5 per cent., to which rate it was reduced from 6 per cent. in 1904-5. The extra profits have been utilised in building up the reserve, which receives £3,500, as against £1,500 a year ago. Better results have not been recorded since 1904, when a dividend of 10 per cent. was paid.

THE DUNLOP TYRE COMPANY.—The report of the Dunlop Pneumatic Tyre Company (Limited) shows a net profit of £200,478, making, with the amount brought forward, £216,517 available for distribution. The directors recommend payment of the balance of dividend on the preference and 8 per cent. ordinary shares, and 10 per cent. on the deferred, making 7½ per cent. for the year; writing off £60,000 from goodwill, and carrying forward £19,000.

SINGER AND COMPANY.—The report to be presented at the annual meeting in Coventry, on Monday next, is for the year ending August 31st, 1907. The board have decided to write down the entire remnant of 1906 motor-car stock of the discarded horizontal type which remains the property of this company—this not having been taken over by the Singer Motor Company (Limited)—to its value as scrap material, being of opinion that it is in the best interests of the company not to attempt to place these cars on the market. They have also written off a large sum against the item of patents, due provision against bad and doubtful debts has been provided, and the usual depreciations on plant, machinery, trade marks, and freehold property have been made. The result, after payment of debenture interest (amounting to £8,000), is a net loss of £17,910 3s. 8d. The Singer Motor Company, Ltd., have made a net profit on the eight months' trading sufficient to pay a dividend of 5 per cent. on their capital, which the directors of the Motor Company, Ltd., propose to carry forward to the 1908 account. The item which appeared in last year's balance-sheet as preliminary outlay on motor department is now represented by 20,000 shares in the Singer Motor Company, Ltd. The retiring directors are Messrs. J. C. Stringer and W. Hewitt. Mr. Stringer, being eligible, offers himself for re-election. Mr. Hewitt, having resigned the office of managing director, does not seek re-election. The auditors, Messrs. Caldicott, Hill, and Caldicott, also retire, and offer themselves for re-election.—The profit and loss account includes the item "to loss on obsolete motor stock £13,154." The deficiency account (including this year's loss) amounts to £21,250.

NEW COMPANIES REGISTERED.

ROSSI.—November 28th. £1,000. Constructors, furnishers, and suppliers on hire or sale of motor-car houses.

MOTOR CABS.—£11,000. To adopt an agreement with Argyll Motors, Limited. As title. 4, Clarence Street, Manchester.

CITY CYCLE AND MOTOR DEPOT.—December 3, £500. As title. 2, Church Street, Sheffield.

MOTORISTS.—December 4. £100. Motor dealers.

BIRMINGHAM MOTOR CAR COMPANY.—December 4. £2,000. As title. Premier Motor Works, Aston Road, Birmingham.

POLICE TRAPS.

A POLICE trap has been established at Crook Log, Bexley Heath. The police are again watchful of motorists exceeding the regulation ten miles an hour in Richmond Park. The Morden road at Wimbledon has now its daily police trap.

THE London and Paris Exchange, Ltd., motor agency, 55, 57 and 59, Shaftesbury Avenue, Piccadilly, W., held an auction sale on Thursday, when a number of cars by leading makers were offered for sale.

OVER a hundred and fifty members and friends attended the annual staff dinner of the Wolseley Tool and Motor Car Company, Ltd., at the Cafe Monico, London, on Wednesday of last week. Mr. J. D. Siddeley presided, and in responding to the toast of "The Firm" stated that the company had delivery orders in hand for cars to the value of over £400,000, and it had on the pay roll at its Birmingham and Crayford Works close on 3,200 hands. He claimed that it was the largest firm of motor manufacturers in Great Britain, if not in the world, and that no other concern produced so wide and good a range of cars and engines for all purposes as is to be found in the Siddeley models for 1908. He referred also to the great reputation for reliability which their products had gained, and urged all concerned to do their utmost to preserve that reputation. A feature of the evening's entertainment was the excellent playing of the Crayford Works Orchestra.

THE CAUSES OF SPRING TROUBLES.

At a recent meeting of the American Society of Automobile Engineers, Mr. J. G. Rumney read an interesting paper on the subject of Motor Vehicle Springs, which contains much useful information regarding these very necessary components. The following abstract will consequently be of interest, especially to those motorists who have suffered from spring troubles.

The laws which govern the construction of springs to obtain the best results, not only in durability but in other respects also, have long been known, but are seldom made use of in the proper way. Many manufacturers furnish and guarantee the life of springs which are constructed not upon well-prepared specifications, based upon the properties of steel and upon a full knowledge of the service in which the springs are to be used, but upon the crudest data and without the least enquiry as to the service. When springs of this kind break the makers are held responsible, and a replacement is requested, and unless they succeed in proving rough usage it is generally complied with; whereas, if conditions or actual requirements were thoroughly understood, the cause of the trouble would be removed, and the manufacturers would not be blamed. The cause of all trouble with springs, aside from poor material and workmanship, is found in an excessive deflection—i.e., a deflection which produces stresses in the material beyond its endurance. The deflection of a given size of steel is limited to an amount corresponding to the strain the material is able to endure without rupture, and consequently if this is exceeded failures will result. The deflection is therefore the paramount issue in the construction of springs. There are, however, three kinds of deflection, which may be termed: desirable, permissible and possible deflection.

The desirable deflection is the amount a spring should be able to deflect in order to avoid shocks and produce good riding over a rough

FIG. 1.—Showing quick vibratory action under light load.

FIG. 2.—Showing slow vibratory movement under increased load.

road, and must be provided for in the construction of motor vehicles so that a sufficient amount of material of proper dimensions may be used. The permissible deflection is the amount a spring may be deflected repeatedly without breaking or without changes in its original shape. The ability of a spring to deflect within safe limits depends entirely upon the proportion of the plates. The possible deflection is the total distance a spring may have the opportunity to deflect if allowed to do so, and which is generally not provided for in the construction of springs. In full elliptical springs, the possible deflection is the distance between the centre when free. The distance can be so proportioned to the dimensions of plates that when the centres meet the material has not been overstrained. In semi-elliptical springs the distance may be much greater than the permissible deflection, and if the spring is permitted to deflect the entire distance it is apt to break or take a permanent set, either of which is equally objectionable. Construction should, therefore, be so made that the possible deflection does not exceed the permissible deflection, and if this is impracticable in the ordinary construction of frames, &c., some means should be introduced which will accomplish the same results.

The object of this paper is, therefore, to call attention to the methods which should be followed in the calculations of elliptical and semi-elliptical springs so as to guard against an excessive deflection, which is the principal cause of broken springs, and thus bring about a better understanding between the makers and users of such springs. It is well known that if a piece of steel or other material in the shape of a bar is supported upon its two ends and a load is applied in the middle of the bar, the material will be subjected to strains, and if the load is great enough the strains will go beyond the endurance of the material, and the piece will break or its original shape will be changed. It is also well known that all material will deflect more or less when supporting a load in this or similar ways, and, further, that the amount a given piece will deflect depends entirely upon the magnitude of the load or its momentum, and that therefore the greater the load the greater the deflection. It is equally as well known, but generally lost sight of, especially in spring construction, that the strain in the material increases directly as the load, and consequently as the deflection. Therefore the strain in the material is twice as great if deflected 2 in. as it is if deflected 1 in.

only, and three times as great if deflected 3 in.; from which may be seen that if there is no limit to the deflection, the material will be overstrained, from which it naturally follows that, while springs are made use of for the purpose of obtaining deflection, and to gradually check and bring to rest a suddenly applied force, it is evident that the deflection must be limited within certain boundaries.

The extent to which a given spring may be deflected—the permissible deflection—depends upon several things, among which may be mentioned the nature of the material, the length and proportionate arch, the width and thickness of the plates. Of these the first mentioned is perhaps the most important, for without proper material the most careful calculations will not produce the desired results. The importance of the other two items is found by calculations based on formula and experience. These formulae show that the deflection is governed entirely by the length and thickness of the plates, and that the relative proportions between these two dimensions cannot be changed without a change in the deflection. A plate of a fixed length and thickness, or a spring of fixed length and thickness, no matter how wide the plate may be or how many plates the spring may be composed of, has a well defined—permissible—deflection which cannot be exceeded without straining the material. The relations between the deflection, thickness, and length of plates must, therefore, be maintained within figures corresponding to the strength of the material, in order that the best results may be obtained. These relations are often overlooked in the construction of springs.

Springs are used on account of their ability to absorb through sudden deflection increases of loads and to regain their original shape when the excess load has been removed, thus avoiding violent shocks. The greater the distance through which a spring can deflect, the longer is the time in which the load is fully applied, and consequently the less severe is the shock. The more sensitive it is to any variations in the load the easier the vehicle will ride. The nearer the spring is loaded to the elastic limit of the material the slower, longer, easier, and more uniform are the vibrations. This statement may not be understood, but may be verified in a simple manner by placing a piece of wood or other material on two supports and load it in the middle with a suitable weight. If the relation of the weight to the material and section of the piece is such that the stress in the material will be comparatively low, the action of the piece, if set in motion, will be in the nature of a number of small, very quick vibrations, as shown in Fig. 1.

The full line is intended to represent the position at rest and the dotted lines the number and magnitude of the vibrations. If the load is increased so as to approach nearer to the elastic limit, the vibrations will be as shown in Fig. 2—a few long, slow movements. There can hardly be any question as to which one of the two methods should be followed in order to produce smooth riding. When deciding, however, as to how near the stress under the static load may approach the elastic limit, it must be borne in mind that if it is too near the limit very little additional deflection can be obtained before the elastic limit is reached and the usefulness of the springs is destroyed. Practical tests have demonstrated, however, that a strain under a static load of 60 per cent. of the ultimate resistance of the material is permissible and will leave sufficient margin, in the majority of cases, for the absorption of ordinary shocks.

I have tried to discover the reasons why springs break, and looking into the matter in various ways the conclusion arrived at is that there is, as it may be called, no safety valve placed upon the springs, that is, at least upon the semi-elliptical springs. The full-elliptical springs have a safety valve, and if properly designed the springs cannot be overstrained, for when the centres meet the strain is at its limit. With the semi-elliptical springs the situation is different; there is nothing to prevent the springs being deflected beyond their elastic limit. The method of calculating springs has been laid down by Reuleaux in his formulae, and if they are properly understood there is no reason at all why manufacturers should not make proper springs. Many manufacturers do not look into the conditions under which the springs have to work; they look on the load and the material, not on the deflection at all, and springs are placed in service in positions where they are not suitable. The breakage of a spring is due to an excess of deflection; that is to say, if the road is rough and with fast speed, the result is that either springs take a permanent set or the plates will break. The deflection is determined entirely by the length of the springs and the thickness of the material. Any spring that is properly designed should last until the material has become fatigued through constant use.

The question as to what should be a proper deflection for springs has been argued in many ways, but I think it will be agreed that the greater the deflection can be made the better the vehicle will ride, and after it has been determined what the deflection should be the remaining requirements may be readily calculated. The riding of the vehicle depends largely upon how high the strain in the material is allowed to be under the static load. The nearer the strain comes to the elastic limit the easier the springs will act; the farther away from the elastic limit, the rougher will be the riding.

MESSRS. WEIGEL MOTORS, LTD., have secured an order for a 40-h.p. chassis from Mr. G. J. Churchward, the head of the Great Western works at Swindon. Mr. Allan, of the Allan line of steamships, has also placed an order through the Glasgow Automobile Company for a 40-h.p. Weigel; and, again, another authority on engineering, Mr. Collard, of the Houston line of steamships, has ordered a 40-h.p. car.

CASES UNDER THE MOTOR CAR ACT.

STATIONARY MOTOR-CARS.

In the Greenock Sheriff Court, Mr. Arthur Reid has been charged with having left a motor-car standing in Westburn Street without taking precautions against it being started in his absence. In the witness-box the defendant said that before he left the car he took the starting handle out, switched off the electric current, turned off the supply of petrol, and put the levers in such a position that they could not be used without being adjusted. He also put on the brake, and left the car out of gear, so that it was impossible for anyone without knowledge of its construction to start it. Sheriff Neish found the charge not proven.

EXCEEDING LEGAL LIMIT.

At Retford Borough Police Court, on the 4th inst., Harry Passmore was charged with exceeding the speed limit of twenty miles an hour. Defendant did not appear, but sent a letter asking for an adjournment. Mr. A. P. Williamson, who prosecuted, opposed the adjournment, and the Bench ordered the case to be proceeded with. Mr. T. Beacoby said

motorists were fined £5 each for exceeding the limit at Kingston and Thames Ditton respectively.

A HEAVY CAR POINT.

At the Kingston County Court, the Berna Motor Works, Ltd., 14, Queen Victoria Street, E.C., have been summoned for using a heavy motor-car in Portsmouth Road, Esher, contrary to the regulations.—It appeared that the motor was drawing a brewer's dray without the weight of the load being painted thereon.—A fine of £1 and costs was imposed.—Henry Walter, the driver, was fined 10s. for driving the car without a light; but a second summons against him for driving the car while unregistered was withdrawn.

ROAD REPORTS.

HILLINGDON.—Application having been made by the Middlesex County Council for the reduction of the speed limit to ten miles per hour through a portion of the parish of Hillingdon East, notices of objection have been given on behalf of the Royal Automobile Club, the Motor Union and various local motorists.

DORSET.—There are nearly 500 miles of rural main roads in the

The above illustration shows the four Humber Cars which took part in the first meeting of the Singapore Automobile Club on June 16th last. The photo from which the picture is reproduced was taken in front of the Clubhouse at Singapore.

on the 24th of last month he was walking along the road at Whitehouses when he saw a car coming from the direction of the town at a tremendous pace. Defendant passed the caution at the end of Upton road without slackening his speed. He thought it to be his duty to report the matter, and he telephoned at once to Supt. Thomas. P.C. Cooper, of the Newark Police, acting on the instructions of the superintendent, went to the Midland crossing at 12.30, and saw the car coming in the direction of the town. He stood in the middle of the road and put up both his arms for defendant to stop. The driver slowed up somewhat, and just before he got to witness he shouted to him to stop. Police-sergeant Walker, of the Grantham Police, went into North Parade with a constable, and presently saw a car coming from the direction of Newark. He put up his hands, and the driver slowed down to about eight miles an hour. He swerved to try and get past, but witness caught hold of the car and ran alongside until defendant was forced to stop the car to avoid colliding with a lamp post. Witness asked him if he had come through Retford, and he said "Yes." A fine of £10 and costs was imposed.

On Saturday several motorists were fined for exceeding the legal limit. At Croydon, two penalties of £7 and costs were inflicted; at Huntingdon, a fine of £15 and costs was imposed, and one of £10 at Grantham on a driver trapped at Great Gonerby; at Kingston two

county of Dorset, and the County Surveyor is calling attention of owners and occupiers of lands where high hedges exist thereon, asking them to cut down the hedges and keep them trimmed, or let the County Council undertake this work for them.

LEEDS.—Very little road covering work will be done in Leeds during the rest of the year by Mr. T. A. Prince, the Surveyor of the Highways.

MONMOUTHSHIRE.—Mr. William Tanner, the County Surveyor for Monmouthshire, is recommending landowners in his district to fix iron open fences in place of the usual hedgerows at dangerous corners of their estates. In some cases his advice is being accepted, but in many instances farmers object, as they consider the "quick" fence a shelter and protection for their cattle and sheep.

COLNE.—The following roads will be under repair at Colne during the next few weeks:—Barrowford Road, Skipton Old Road, Waterside Road, Emmott Lane.

SCARBOROUGH.—The Seamer (Scarborough) Parish Council is urging that a danger post should be fixed near the Walker Lane, in the centre of the village.

MASSACHUSETTS.—Great success has attended the sprinkling of the surface of the roads in that part of Massachusetts, U.S.A., known as the North Shore with a solution of calcium chloride.

FORTHCOMING EVENTS.

— 0 —
DECEMBER.

- 14th (Sat.).—Assembly of wagons, lorries, and tractors near the Thames Conservancy Office, east of Waterloo Bridge, Victoria Embankment, London, in connection with the motor drivers' prize scheme of the Commercial Motor Users' Association, at 3 p.m.
Motor Cycling Club Annual Dinner.
Walthamstow M.C. Annual Dinner.
18th (W.).—General Committee of the Motor Union.
The Tenth Annual Dinner of the Founder Members of the Royal A.C. will be held at the club-house.
19th (Th.).—Auto Cycle Club Discussion on Variable Gears.
21st (S.).—Opening of the Brussels Exhibition.

JANUARY, 1908.

- 1st (W.).—The Lights on Vehicles Act comes into operation in England, Wales, and Ireland.
4th-11th.—Dublin Motor Show.
8th (W.).—Incorporated Institution of Automobile Engineers—Dr. H. S. Hele-Shaw on the Fuel Question.
9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.
17th (F.).—Annual Dinner of the Nottinghamshire A.C. at the Victoria Station Hotel, Nottingham.
18th-Feb. 2nd.—Automobile Exhibition at Turin.
24th (F.).—Annual Dinner of the Scottish A.C. at Edinburgh.

FEBRUARY.

- 1st (Sat.).—Annual meeting of the Lincolnshire A.C.
2nd (Sun.).—Reliability Trial of the Motor Union of Western India.
7th 15th.—Manchester Motor Show at Belle Vue.
12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
15th (Sat.).—Auto-Cycle Union Annual Dinner.
20th (Th.).—Meeting of the Essex M.C.
24th (M.).—Motor Show at Bcmabay.

MARCH.

- 21st-23rd.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

APRIL.

- Autc-Cycle Union's Tourist Trophy Race and Quarterly Trial.

AUTOMOBILE ACCIDENTS.

ON Saturday a mishap occurred to the motor-car driven by Ald. G. H. Strutt, J.P., D.L., the chairman of the Derbyshire County Council. He was proceeding to the Alderwasley estate for shooting. When near the railway bridge on the Matlock road the car skidded and collided with the kerbstone. The hind wheel was broken, but fortunately no one was hurt.

A MOTOR-CAR, owned and driven by Mr. David Bentley, of Kingston, has collided with a trap on the Portsmouth road, at Esher Common. The occupants of the latter vehicle—Mr. T. Cooper, also of Kingston, and his sister—were thrown violently to the ground, the former sustaining concussion, from which he has died at Esher Cottage Hospital.

A SERIOUS motor-car accident has occurred near Alnwick. A car, driven by Mr. Inglebeck, was approaching Alnwick from the south. The roads were covered with a coating of ice, and, meeting two carts, Mr. Inglebeck, to avert a collision, steered the car to the soft ground at the side of the road, with the result that it was overturned. The vehicle turned two somersaults and passed over a hedge into a plantation some twenty feet away. The chauffeur, who was also in the car, was thrown out, and Mr. Inglebeck was badly crushed on the chest.

THE motor mail van bound from Brighton to London broke down on Sunday morning when passing through Cuckfield. On making an examination the driver, Charles Burch, found that the cardan shaft had broken off. A telephone message was sent to London for another motor-van, which arrived at seven o'clock and took the mails to their destination. The damaged van remained by the roadside pending the arrival of a lorry to take it to London.

As a party of motorists were passing Greenford they ran into a large sheet of water caused by the overflowing of the Brent. They shouted for assistance for half an hour in vain, and eventually the chauffeur paddled to a farm, where a horse and chain were obtained, and the car was drawn to the shore.

THE skidding of a motor-bus scattered many of the street hawkers who have recently migrated from Ludgate Hill to Holborn Viaduct, London, on Saturday night. The vehicle was proceeding in the direction of the Bank when it skidded on the greasy surface, knocking down three of the hawkers, two of whom were taken to St. Bartholomew's Hospital and detained.

BUSINESS NEWS.

MESSRS. HUET AND CO., of South Ann Street, Dublin, are handling the Stepany spare wheel in Ireland.

MESSRS. MUTEL ET CIE, of Paris, have opened a depot for their chassis, engines, carburettors, &c., at 19, Nassau Street, London, W.

THE success of the Aster engine is naturally inducing imitations, and we are requested by the company to draw attention to the fact that all genuine Asters bear the name-plate of the makers.

MR. J. S. NUTTALL, of Hertford Cottage, Werneth, Oldham, writes that he has just completed 14,000 miles on his Coventry Humber, "with only one involuntary stop, due to a choked petrol pipe."

THE Motor Manufacturing Company, of Manor Street, Clapham, S.W., are closing their works from Christmas Eve until the following Monday.

MESSRS. RUSH AND ALOOF, 199, Piccadilly, W., have been appointed West End agents for the Davis paraffin carburettor.

THE Vita plugs brought out by Mr. J. A. Ryley, 23, Martineau Street, Birmingham, have had a phenomenal sale during 1907, and the magneto pattern appears to be quite as successful as the ordinary model.

PRICE'S PATENT CANDLE COMPANY LTD. have issued a batch of distinctive literature with regard to the lubrication of petrol engines which will be of considerable service as well as of interest to motorists.

MESSRS. JAMESON, STUART AND COMPANY have removed their offices from 7, Harrington Road, S.W., to 55, Sussex Place, S.W., and are enlarging their workshops and private lock-up garages. They have secured the London agency for "S.C.A.T." cars, and are continuing their agencies for "Isotta Fraschini" and "S.P.A." cars.

MESSRS. GIBBONS BROS., LTD., send a useful blotting pad and calendar for 1908, which serves to draw attention to their manufactures of fireclay goods, as well as their work as general engineering contractors, makers of tip-wagons, &c., at Dudley.

MESSRS. KATZ BROS., LTD., of London, Singapore and Penang, have been appointed sole agents for Messrs. A. Darracq and Company, Ltd., for the Straits Settlements and Federated Malay States. Messrs. Katz Bros. will keep a large stock of Darracq cars, spare parts, petrol and pneumatic tyres in their various branches in the East.

THE sale of the motor-cars and stock in trade of the Academy of Motoring Limited will take place on Wednesday next at Chester Street, Grosvenor Place, London, S.W., Messrs. Fuller, Rogers and Ruddock being the auctioneers. The lease of the garage will also be offered, by order of the liquidator, Mr. P. B. Adams, from whom catalogues of the sale can be obtained.

THE ROTAX MOTOR AND CYCLE COMPANY, 43 and 45, Great Eastern Street, and 60, Curtain Road, London, E.C., whose specialities for motorists were recently described in our report of the Motor Exhibition, forward a copy of their catalogue of accessories, which is most comprehensive and should prove useful to all engaged in the motor trade. Several specialities are illustrated, the Rotax headlamps being of particularly pleasing design.

THE B.S.A. car is the product of a factory equipped with the very latest machinery and organised specially for the manufacture of automobiles by the Birmingham Small Arms Company, Ltd. The experience gained in the manufacture of rifles and bicycle parts is now expended in putting upon the market a car the materials of which are all carefully selected and tested; the design of the car is conventional, there being no radical departure, unless it be, as the makers claim, that the materials are far better than any hitherto put into a motor-car. The chief features of the B.S.A. car are its simplicity, solidity of construction, and easy accessibility to all the parts, absolutely automatic lubrication and great strength of the steering gear.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which they are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, other wise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, DECEMBER 21, 1907.

[No. 459.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

NOTICE.

Owing to the Xmas Holidays THE MOTOR CAR JOURNAL will go to Press on Monday next.

Contributors and Correspondents are requested to send their communications by first post on the morning of the 23rd inst.

All advertisements should reach the office not later than the first post on Monday next; alterations in the "copy" of displayed advertisements should be to hand during Saturday morning.

COMMENTS.

RIGHT heartily do we wish our readers a Merry Motoring Christmas and a New Year of Prosperity and Plenty. 1907 has brought disappointments as well as pleasant things. We shall not soon forget the weather that hindered business in the early part of the year, nor will it be early forgotten that November was a month of treacherous climate and foggy days. Despite the absence of anything approaching a boom, a steady flow of business has been observable through the year, and although many makers would like to see better prospects of reducing stocks, there has been an absence of those dire distresses which were foreshadowed before the exhibition as likely to darken the last days of the year. The public, too, can be congratulated on the spirit of invention which is being encouraged in motor-car matters, and which is combining with the highest engineering skill to place Great Britain in a proud position in the international motor-car world. In connection with the holidays we would remind motorists likely to be on tour during Christmas that they can do something to earn the goodwill of those engaged in the industry by making known beforehand their probable requirements for the season. It will save possible worry and loss of time if all who go travelling by car will previously make known their likely wants at very distant places with the local firms, so that supplies of spares and accessories, tyres, oil, &c., can be replenished in readiness for the demand that is likely to arise, in the event of there being a season of good weather.

Costs against the Police.

NOT often do we hear of motorists obtaining costs against the police, but such an instance has just occurred at the Daresbury Petty Sessions, at the instance of Mr. T. W. Grace, the well-known motoring solicitor of Manchester. Mr. R. H. Pesnett, of Runcorn, was summoned for driving a motor-car in a manner dangerous to the public. The police superintendent, in his evidence, described the collision that had taken place between the motor-car and a pony drawn trap. Subsequent witnesses who were in the latter vehicle admitted that the accident had happened owing to the carelessness of the driver,

and that it was owing to the presence of mind of the motorist that the mishap was less serious than it might have been. Thereupon the magistrates, without hearing any evidence from the defence, dismissed the case and allowed three guineas as costs. Where the police are unable to fully establish their case against motorists it seems only reasonable that such results as these should follow; but the fact that it is so exceptional suggests a reason for thus prominently drawing attention to the instance.

Postprandial Points.

SEVERAL of the leading automobile clubs have been holding their annual dinners, which in some cases have been attended by representatives of the local authorities, who have testified to the growing goodwill between motorists and the public. At the dinner of the Sheffield Club, to which reference is made in our Club news on another page, Mr. Fearnley, of the Municipal Tramways Department, alluded to the universal Lights on Vehicles Act which will come into operation at the beginning of 1908, and which in his view will tend to secure greater safety to all users of the highways, whether in towns or villages. At the Harrogate meeting, on Saturday, Dr. Holroyd, in responding to the toast of the local club, made reference to the action they had had with the Corporation of Harrogate as to the attempted imposition by the latter of a rate of £1 per year on motorists using water for washing cars. The case was taken to appeal and decided against the authority, constituting a test case, which will doubtless stand for a good many years. It is gratifying to learn that the club and the Corporation have since become good friends and that amity now prevails between the motorists and the corporation of the famous Yorkshire town.

The 1908 Trial.

THE first meeting of the Joint Committee of the Royal A.C. and the Society of Motor Manufacturers and Traders has been held, and after the preliminaries of the trial had been settled a small sub-committee was appointed to draft the regulations. Both organisations have had in mind the "1,000 Miles Trial" of 1900, which passed through all the principal towns in the country. In 1901 a 500 miles reliability trial was organised by the Royal A.C. with the co-operation of the Scottish A.C., and started from Glasgow. Then a 650 miles trial was held, with the Crystal Palace as the centre of operations. In 1903 a 1,000 miles trial was arranged, and again the Crystal Palace was made the centre of the radiating routes. In 1904 small car trials were held with Hereford as the centre. The 1908 trial will probably cover a distance of something more than 2,000 miles, with twenty miles of hill-climbs and a 200 miles race on the Brooklands Track to provide a sporting finish. The trial will start from London and proceed to Glasgow, when the Scottish Trial will commence, and at the conclusion of the Scottish Trial the cars will continue their 2,000 miles journey. Entries can be made for the whole 2,000 miles trial or for the Scottish Trial only, or for both. The distance run in Scotland will be roughly about 750 miles, and on the arrival at Glasgow the whole of the cars will be under the management of the Scottish A.C., until the conclusion of the Scottish Trial, when

the Royal A.C., will again take over the direction of affairs. The Scottish Trial will be run on the lines as heretofore and its distinctive character will be preserved. There will be ten classes, based on R.A.C. rating, while in the Scottish Trial the basis of classification will be price, as in former years. The suggestion of the Scottish Club that the cars should arrive in Glasgow at the end of the second week in June has been adopted. It would probably have been impossible to find sufficient hotel and other accommodation in Scotland prior to that date.

The Future of the Motor Union.

competition between the Motor Union and the Royal Automobile Club and that there should be, at any rate, certain well defined

CAREFUL consideration has been given to the future policy of the Motor Union by the Emergency Sub-Committee recently appointed. In the view of the sub-committee it is most undesirable that there shall be any unnecessary conflict or

R.A.C., and that the M.U. shall uphold the authority of the Club in these directions. On the other hand, they suggest that the R.A.C. shall recognise in the like manner and to the same degree that general legal and legislative questions are specially within the province of the Motor Union, and that the R.A.C. shall uphold the authority of the Motor Union to deal with these questions on behalf of the automobile community. The views of the R.A.C. on this proposition are now awaited. In order to give Provincial clubs full opportunity of expressing their views respecting the present position a conference of the affiliated clubs will be held early in January next.

Our English Landscape.

THE article which we publish this week on Kentish highways and byways recalls some interesting reflections which Mr. Hilaire Belloc, M.P., recently made on the landscape of our country. England is traversed by remarkable and sudden ranges; hills with a sharp escarpment overlooking great undulating plains. This is not true, he points out, of any other one country of Europe, but it is true of England, and a man who professes to understand and to love this country must know the Pennines, the Cotswolds, the North and the South Downs, the Chilterns, the Mendips, and the Malverns; he must know Delamere Forest, and he must know the Hill of Beeston, from which all Cheshire may be perceived. If he knows these heights and has long considered the prospects which each affords, he can claim to have seen the face of England. In the olden days men knew the features of their native country. The roads for carriages went over the hills; nowadays the tunnelled path of the railroad saves that trouble, and loses the view. But with the coming of the car all that will change and again the traveller may know something of the landscape and learn to appreciate its ever varying beauties.

The Royal A.C.

EXACTLY ten years have passed since the Royal Automobile Club was formed under the title of the Automobile Club of Great Britain and Ireland, with room at 4, Whitehall Court, Westminster, S.W.—just behind the new buildings of the War Office. In the early months periodical discussions during the winter and holiday tours during the summer were leading features in its campaign for the recognition of the automobile. With Mr. Roger Wallace as the chairman, it brought the motor-car well to the front, and steadily grew in influence and extent until, in 1902, a migration further west was undertaken, and it became housed at 119, Piccadilly, W. The advance has continued, and other buildings in the vicinity have been rented from time to time, occasioned by the increasing activities of the organisation. Latterly the need for larger headquarters has again become pronounced, and at length it has been definitely decided to secure the building lately used as the War Office in Pall Mall, W., for the purposes of the club. Thus the Royal A.C. will take a premier place in clubland, representing a movement which must be accounted among the most characteristic of the century in which we live.

Impatience to be Deplored.

AT the Manchester County Court, on Monday, Judge Parry gave a little homily on the unwisdom of selfishness on the road, and enjoined a lesson of patience to a motorist who was mulcted in damages. A cyclist was on the road, his view being obstructed by a tramcar passing into the thoroughfare. As soon as he emerged beyond the tramcar he was knocked down by a motor-car. In giving judgment his Honour said that nowadays not only did tramcars go at a great pace through the streets, but motor-cars rushed about with every evidence of their drivers wishing to get as quickly as possible from one place to another. In this instance there seemed no reason why the occupants of the car should have been in a great hurry, yet they were unable to

Touring in Spain.—A Daimler Car on the Toledo Bridge, Madrid.

spheres of action of the two bodies. The work that still has to be done for the automobile movement is so great that there is plenty of room for the activities of both bodies without undue overlapping. They have, therefore, thought it desirable to ascertain whether the Royal A.C. accept this view, and are willing to act upon this principle. Accordingly Mr. C. H. Dodd, chairman of the committee, has written to Mr. C. D. Rose, M.P., pointing out that it has hitherto been generally recognised that matters connected with the sport of automobilism, trials, and competitions, are particularly within the province of the R.A.C., and that the M.U. is the body which is particularly concerned with legal and legislative matters, and the protection of the rights and privileges of motorists upon the road. As regards the future he suggests there should be an understanding between the two bodies, whereby all matters connected with sport, trials, and competitions shall be within the province of the

wait a few seconds while the tramcar passed and left clear what was beyond. There is no doubt that where tramcars are occupying a considerable portion of the roadway motorists should exercise the greatest care and patience.

Encouraging Drivers.

THE Judges' Committee of the Commercial Vehicle Users' Association met on Saturday to adjudicate in connection with the prize scheme for drivers inaugurated by that Association. The importance of the driver as a factor in the success of the motor vehicle on the road will be readily recognised, and anything which tends to raise his standard of excellence is to be commended. Therefore, we welcome the plan proposed for the encouragement of drivers in the way of keeping their machines in the best possible condition, and to run them with the minimum of accident as well as of expense. At present the Committee have wisely restricted the operation of the scheme to the London area, but as the motor-van grows in favour the idea will doubtless be taken up in the provinces, to the advantage of the motor movement generally. It is interesting to note that twenty-six drivers for sixteen firms entered for the first competition of

papers, which had motor notes before the more staid journals saw the advantage of the car; the route of the 1,000 miles trial, the official visit of the Chinese Ambassador to Coventry motor works; a meeting of the Motor Trades Association, presided over by Mr. H. J. Lawson, and the report of the Daimler Motor Company, altogether an interesting reminiscence of the days when "news" was less plentiful than now.

Personal Appearance Saves Money.

THE magistrates of the Steyning Petty Sessions, who regularly sit to hear cases against motorists, had a somewhat poor day recently. General R. T. Goodman was presiding over a full bench of magistrates, and three victims of a trap laid on the Ashington Common were expected. None put in an appearance, two writing letters, and one having apparently forgotten the appointment. Of the first couple, one admitted the offence, and was fined £5 to encourage him in candour; the other was somewhat argumentative, and expressed the opinion that he had not exceeded the legal limit. That, however, availed him nothing, and the case was adjourned until a more convenient time for his attendance. A similar adjournment in

Mr. W. T. Clifford-Barp on the 60-h.p. Thames Car on which he last week set up new world's records on the Brooklands Track.

this kind, seven different types of vehicles being represented on the Thames Embankment on Saturday. A gratifying feature of the contest, too, was the presence of a representative of one of the London municipal authorities, and the Commercial Vehicle Users' Association might well draw the attention of the authorities in places where motor-vans are in corporation service, to this competition as a means of inciting their drivers to give proper attention to the property of the ratepayers. Many of the vehicles that were paraded have travelled 20,000 miles during the present year. On another page we give the names of the prize-winners.

Eight Years Ago.

TAKING a glance at the pages of the M.C.J.—suggested by the reference in Mr. Filson-Young's "Complete Motorist" to ourselves as among the pioneers of the movement—we stopped at the issue for December 15th, 1899. Then we were advising motorists to keep away from Brighton, which was displaying venom towards motorists, and chronicling such interesting doings as a projected trial of electrical vehicles; the recognition of the automobile by the halfpenny morning

the third case was made, a warrant being issued by way of reminder of the fact that Justice must be obeyed. So, on the next occasion the magistrates meet at Steyning, they will ensure having two motor cases before them, plus any fresh captures on Ashington Common.

The Forage Merchant.

WHILE the leather industries are not so seriously alarmed at the diversion of business, forage merchants and the like are almost despairing of prosperity in London, where electric trams have combined with motor-cabs and motor-buses in sending horses out of employment. These are seriously hit by the advance of means of mechanical travel, and "for us there is no hope" was the lament of one of their number to the writer the other day.

THE British Consul at Buenos Ayres, Argentine Republic, reports the formation in that city of a company with the title La Camionera, and a capital of about £132,000, for the purpose of establishing a goods and parcel transport service by means of motor vehicles.

MOTORING IN MEXICO.

A STRANGER descending into the Valley of Mexico from the high mountains which surround it on all sides, and looking through the eyes of an automobile enthusiast, would think it a paradise. But, after being there a short time, he would be compelled to change his mind. The streets in the City of Mexico are being gradually paved with asphalt. Of course that is good as far as it goes, but one does not want to be always riding about the city, through crowded streets. The views in Mexico Valley are magnificent. To the east the snow-clad peaks of Ixtaccihuatle and Popocatepetl rear their giant heads some 10,000 ft., each covered with a cap of perpetual snow. The peaks are about fifty-five miles away, and on clear days seem near enough to reach on foot in an hour or two. To the south-west is the old volcano of Ajusco, which at one time threw all the lava into the valley. The lava beds near San Angel and Tlalpam prevent making any direct road between the two towns, and one is compelled to go around them three times the distance. Still looking toward the south-west one gets a glimpse of Chapultepec (the hill of the grasshoppers), on which are the Castle of Chapultepec, which is the presidential residence, and the National Military Academy. To the west is the mountain range separating Mexico Valley from the Valley of Toluca. To the north-east one can see the Church of Guadalupe, where is the miraculous painting of the

Motoring in Mexico.—Cars outside the Military School at Chapultepec.

Virgin of Guadalupe, and if one is on high ground he can see on a clear day, some forty miles away, the Pyramids of the Sun and the Moon, built centuries ago, by whom and for what purpose nobody can tell.

But, with all these beautiful views, clear skies and the fine, clear winter days, and the cool, pleasant mornings of summer, much cannot be said for the roads. Though the Mexico Valley is about thirty miles wide and sixty miles long, there are no good roads to take a car to the mountain. The Government is now at work, remarks Mr. A. W. Evans in an American contemporary, building a road so that it will be fit for a motor-car to climb over the ridge which separates the valley from the outside world. This road, which is very steep, runs up the mountains, toward the south-west of the city, and after reaching the top it winds down into the Valley of Toluca, and to Toluca, the principal city and capital of the State of Mexico, Mexico City being the capital of the republic.

The ride up to Toluca can be made by good cars, and it is an excellent test of the climbing capabilities of a machine. Part of the way up one can turn to one side and go to El Desierto, which is one of the most beautiful spots near Mexico City. In the midst of a forest of tall pines one will find the ruins of an old Carmelite monastery, with its small chapels and hermitages in ruins and moss-covered, all scattered through this forest of sweet-scented pines, and old aqueducts which the monks built to carry water to their hermitages, also more modern aqueducts built by the city govern-

ment to carry the clear pure water into the city, sixteen miles distant. The road to the monastery is not a good one, the greatest drawback being the steep grades, some of which run 27 per cent. at least, which, together with the fact that the altitude is fully 11,000 feet above sea level, make it hard for motor-cars. Only three machines have so far succeeded in getting to the monastery. After leaving the forest there is a fine view of the valley, with the city almost at one's feet, and the lakes of Texcoco and Chalco just beyond, with the mountains rising up almost from the shores of the lakes.

The road to Toluca is the only highway of any length that has received attention from the Government of the Federal District, which will take one any distance from the city, as the monastery is only about ten miles therefrom, and Toluca forty miles. It is steep and winding, but the grandeur of the scenery repays the climb. The Federal Government has finished a macadam road from the City of Mexico to Mixcoac, about seven miles, and they intend to extend it as far as San Angel, which will give a drive of about thirteen miles. They are building a road more to the east and parallel to the one just mentioned, which will lead to Tlalpam. It is now finished as far as Churubusco, so that the lovers of golf who own cars can run out to the magnificent club house the Mexico Country Club is erecting there. The road to Tlalpam when completed will make possible a run of some nineteen miles, and as there is a good cobble road through Coyoacan to San Angel it will make a loop of nearly thirty-five miles. The Coyoacan road from San Angel passes by the palace of Cortez in Coyoacan, and joins the Tlalpam road at Churubusco.

Besides these roads, which are now being reconstructed, there are the shorter ones, such as Paseo, or the famous drive of the City of Mexico, which is very wide, with double rows of shade trees on each side, outside which on each side are roads exclusively reserved for automobiles and cycles. This drive, which starts at the bronze equestrian statue of Charles IV., ends at Chapultepec, about two and a-half miles distant. The central avenue for carriages is very smooth, but one cannot go at very great speed, for at every quarter mile is a "gloriated," or widening of the drive into a circle, having a statue or a large flower bed in the centre, where one has necessarily to slow down.

To the north of the city there is a short drive of about three miles to Guadalupe, with a good, hard macadam roadbed, and to the north-west a short macadam road leading to Popotla, or place of the brooms, a small town, where the tree still stands under which Cortez rested when he was driven out of the city by Aztecs in 1520. The motorist can follow this road as far as the little town of Atzacapotzalco, making a ride of about four miles in that direction. One can go beyond, but over narrow, winding roads, sometimes full of ruts and bumps, and with creeks, unbridged, and on both sides deep ditches, each having its row of high maguey plants.

Motoring in other parts of the republic is much the same as in the district surrounding the City of Mexico. The hills and the altitude are the greatest hindrance. Then, again, outside the cities, where there are some good country roads, cars can only be used one half the year on account of the rainy season, when it rains every afternoon for at least four months. For two months the weather is doubtful, and for the remaining six months, or winter, it is ideal.

THE Dominion Motor Car Company, of Montreal, is devoting considerable attention to the industrial motor vehicle branch, and have lately sold an Argyll three-ton petrol motor lorry to the Dominion Bridge Company, of Lachine, Quebec, and a similar vehicle to the Riordan Paper Mills, of Merriton, Ontario.

THOSE who travel with the Letts's diaries published by Messrs. Cassell and Company, Ltd., upon them are insured against accidents while travelling as passengers in motor-cars, cabs or 'buses as well as the older forms of locomotion. Letts's diaries for 1908 are now issued in various forms and bindings—all durable, neat, and useful for the particular purpose for which each is designed. Professional, scribbling, office and commercial diaries are included in the excellent series.

THE CONCOURS DES PANNES.

THE novel "Concours des Pannes," or breakdown competition, organised by the "Auto," took place in Paris on Sunday last, at the Clichy depot of the Meteor Taxi-Motor Company. A number of small bays had been established in each of which a Unic motor-cab was placed. The vehicle for some cause or another was not in running order, the *panne* or breakdown, being, however, such that could be repaired by the tools, &c., found on the vehicle. At a given signal the competitors had to set about discovering the cause of the trouble, and when found and put right, to drive the car a short distance to show that it was in running order. A maximum of twenty-five minutes was allowed to each competitor. In order to prove the all-round capabilities of the drivers they were afterwards required to take off one of the back tyres of their cab and replace it, the usual tyre tools and jack being provided and a maximum of twenty minutes allowed. Forty-six drivers entered for the event, thirty-two of whom actually took part, and in view of this large number it was resolved to divide the competition into heats with a final. In the first series, ten competed and three qualified, the cause of

respectively 20, 15, 12, 8, 6, 5, 4, 3, and 2 per cent. of the entry fees. Altogether the competition proved most interesting and instructive.

INDUSTRIAL VEHICLE TRIALS IN FRANCE.

THE Competitions Committee of the French Automobile Club has issued the rules and regulations with regard to the reliability trial of industrial motor vehicles which is to be held from the 25th April to the 25th May next. The machines will be divided into the following eight classes:—1, For loads from 50 to 200 kilogs., entry fee £12; 2, ditto from 200 to 900 kilogs., £20; 3, ditto from 900 to 1,500 kilogs., £30; 4, ditto from 1,500 to 2,000 kilogs., £40; 5, ditto from 2,000 to 3,000 kilogs., £60; 6, ditto over 3,000 kilogs., £60; 7, public service vehicles, carrying from six to ten passengers, £40; and ditto for more than ten passengers, £60. As regards repairs, it is intended to divide the components of the chassis into three groups—1, those which may be changed at will; 2, those which will be

The Concours des Pannes, or Breakdown Contest.—Some of the Competitors at work.

the trouble—a small piece of lead sheet causing a short circuit—being discovered by P. Miltgen in 1 min. 28 sec. Eight drivers were in the second series, but only one succeeded in getting his car going within the time limit—the cause of the trouble in this case being a stoppage in the inlet pipe. For the third series there were ten competitors, of whom four succeeded in locating the difficulty—a blocked petrol jet—while four competed in the last series, two of them discovering that the petrol cock was closed, and that the ignition contacts had been inverted. There were ten competitors in the final, in which Miltgen again proved the victor, he finding out that the make-and-break contact of the magneto was deranged, and putting the same in order in 11 min. 18 sec. As he was the only one to do this within the time allowed, he was awarded the first prize of 25 per cent. of the entry fees and the silver medal offered by the Cab Company, and it was decided that the object of the tyre-fitting trial should be confined to awarding the remaining prizes to the nine competitors who while getting through their series had failed in the final. This was fortunate for Miltgen, for while expert as regards engine troubles, he failed to change the tyre in twenty minutes; the second and subsequent prize-winners were Bonnet, Aubry, Hellio, Danlion, Lallemand, Roumagere, Reichmath, Battais, and Dube, who took

marked, which can only be replaced by marked spare parts, of which only a limited number will be permitted by the regulations; and 3, all parts not comprised in the two previous sections may not under any pretext be changed. Pneumatic tyres will not be allowed; while no change of tyres, nor of parts of spring wheels, will be permitted. The classification will be made according to categories, and the consumption awards will be based on the formula $\frac{TC}{PD}$, where T = the length of the trial in hours, C the value of the fuel consumed in francs, D the distance covered in kilometres, and P the useful load carried, plus the tare weight of the vehicle. Any form of liquid or solid fuel may be employed, but all cars fitted with internal combustion engines will be required to run on alcohol during a certain number of days.

THE Hove Town Council have been informed that the Watch Committee have had an interview with the directors of the Brighton, Hove, and Preston United Omnibus Company, who assure the Committee that they are endeavouring, and will continue to endeavour, to do their best to meet the wishes of the Council with regard to the running of their motor-buses.

THE UNTERBERG-HELMLE HIGH-TENSION MAGNETO.

AMONG the many high-tension magnetos on view at the recent Paris *Salon* one of the most interesting was that displayed by Messrs. Unterberg and Helmle, of Carlsruhe, Germany. It is of the true high-tension type, having both a coarse wire primary winding and a fine wire secondary winding on the armature, so that no coil is required. The field consists of three double permanent magnets secured to a bronze base. The make and break device is operated by the armature; the latter is provided with a fibre ring with two flats on its inner circumference, these acting as cam surfaces and actuate the make and break device, which consists of a stationary adjustable contact screw and a substantial double-armed lever carrying the free contact point. The entire mechanism of the interrupter, together with the condenser, is carried in a hollow metal cylinder or cap, which is held in position by a spring clip, and can therefore easily be removed. This is of particular advantage when it becomes necessary to adjust the interrupter; in such a case the driver need not try to reach the affected parts located in a confined space near the hot and greasy engine, but can take the whole mechanism out and inspect and adjust it in plain daylight. A gauge is furnished with the machine for accurately adjusting the interrupter contacts. The condenser is also located in this cap, this arrangement being claimed to be an improvement over the practice of incorporating it in the revolving armature, as the mechanical strains on the insulation are absent in the stationary device.

The high-tension distributor is located directly over the interrupter, and is driven from the armature through spur gearing. The distributor has a base of red vulcanite, and the revolving member is of black hard rubber. Combined with the high tension distributor is a safety spark gap, which is located at the forward end of the distributor shaft, and any sparks passing through this gap can be observed through mica windows fitted into the cover over the distributor, which is held in place by a spring clip, the same as the interrupter.

For setting the magneto with relation to the motor, a machine screw in the cover plate over the armature is removed and a pin furnished with the machine is inserted in the opening for the screw. The armature is then turned by hand in the reverse direction to that indicated upon the frame as the proper

Fig. 1.—General View of Unterberg-Helmle Magneto.

direction for running, and at the same time pressure is exerted on the above mentioned pin, by the other hand, until it drops into a depression in the armature provided for this purpose. The proper position of the armature for the dead centre position of the engine is thus obtained.

An original feature of the magneto is an automatic arrangement whereby the armature is moved through the magnetic field when starting the engine at a much higher speed than that corresponding to the speed possible with the starting handle. This arrangement secures several advantages. A hot spark is produced even though the engine be turned slowly, consequently

the driver need not exert so much effort in starting up the motor; moreover, the spark at starting being strong, it is not necessary to relieve the compression of the engine, as the pressure generated by the magneto is sufficient to jump across the gap of the plugs under full compression.

Two views of this "snap-start" device are shown in Figs. 2 and 3. A is the shaft to which the driving gear is keyed; formed integral with this shaft is the steel disc B. This disc at one point of its circumference carries a pin C, over which passes the loop of a spring E made with large diameter spires of heavy steel wire. It will be understood that if the shaft A is turned in a right-handed direction the spring E will be wound up. The other

Figs. 2. and 3.—Sectional and Front View of "Snap-Start" Device on Unterberg-Helmle Magneto.

end of the spring is secured by a pin *d* to a brass disc F, which is fast to the armature. The disc F is of rather irregular shape, and is provided with a radial slot in which is located a steel ball G. When the disc F moves in a right handed direction the steel ball G abuts against a projection H of the stationary armature casing, and thereby prevents the disc F and the armature from rotating. The result of this is that when the shaft A is rotated the spring E is wound up; this continues until a conical depression I in the disc B comes opposite the steel ball G. Then, the ball dropping into this depression, the armature is suddenly released, the spring distends and gives the armature a considerable speed of rotation, whereby a hot spark is produced. The projection or cam H is, of course, so arranged on the circumference of the field pole circle that the unwinding of the spring begins when the armature comes into the zone of greatest inductive activity. When the engine has started and has attained its normal speed, the steel ball is carried to the outer limit of the slot in the disc F by centrifugal force and does not strike the projection H in its rotation.

The magneto is made for engines of any number of cylinders, the one illustrated in Fig. 1 being designed for a six-cylinder motor.

MOTORLAND, LTD., is the name of a new concern which has lately been established at 314, Vauxhall Bridge Road, London, S.W., where the needs of all classes of motorists will be catered for. The company is introducing three types of cars ranging from a little two-seater at an extremely moderate price to a 30-h.p. six-cylinder vehicle. The Motorland Midget, as the first-mentioned car has been named, is fitted with a 7-8-h.p. single-cylinder engine and cardan shaft transmission. The six-cylinder car is known as the Autocrat; it comprises a number of special features, to which we hope to make further reference in a later issue. Both the cars referred to above are, it may be mentioned, entirely of British manufacture. Motorland, Ltd., have also secured the British concession for the French-built cars known as the Demeeester. Three sizes of these are being made, viz., 10-h.p., 14-h.p., and 18-h.p., all fitted with four-cylinder engines, the details throughout being on modern lines. The company is also keeping a large stock of accessories, and is making a speciality of a new non-skid tread known as the "Pasco."

CONTINENTAL NOTES.

The 1908 A.C.F. Grand Prix Race.

The Automobile Club of France announces that the entry list for next year's Grand Prix has been opened, and will close at ordinary fees at 6 p.m. on February 15th, 1908. Entries at double fees will, however, be received up to June 1st. The race is to take place on a date, to be selected, during the first two weeks of July. The distance will be from about 437 to 500 miles. The entry fees have been fixed as follows:—One car, £200; two cars, £360; three cars, £480. The rules will be those adopted at the Ostend Conference, by which the motors must have a maximum bore of 155 millimetres for four cylinders, and the minimum weight, without passengers, petrol, water, or spare parts, must be 1,100 kilogrammes. The route on which the races will be run has not yet been decided upon, but it is considered that the Dieppe circuit will most probably be again chosen. The first entries for the race are three German cars, which will be driven respectively by Messrs. Degrais, Roch-Brault, jun., and Perpère.

likely that they will shortly be adopting them in various departments, as they have just invited French manufacturers to submit prices of motor street sweeping machines, water carts, and fire engines, &c.

An International Congress on Roads.

The first step has just been taken by the French Minister of Public Works in connection with the International Congress on Roads, which is to be held towards the end of next year, by the formation of an Organising Commission, with M. Lethier, Inspecteur-Général des Ponts et Chaussées, Baron de Zuylen, of the A.C.F., and M. Baillif, of the T.C.F., as presidents. Several sub-committees have also been formed to deal respectively with matters of finance, receptions and excursions, technical details, and an exhibition.

Motor Boat Races at Monaco.

The programme has just been issued of the annual motor-boat exhibition and race meeting to be held at Monaco, from the 1st to the 13th April next. In addition to a two-days' show, there will be a race for cruisers having single-cylinder

The Motor-Car in War.

The above illustration depicts a Panhard Car, equipped with a Hotchkiss quick-firing gun, being loaded on to a steamer at Marseilles en route for Morocco, where it is to be used by the French military authorities in the troubles that have arisen on the frontier.

The Motor-Car Industry in Germany.

A meeting was held at the Ministry of the Interior in Berlin last week, at which representatives of the Government, of leading German automobile clubs, and of motor-car makers attended. The delegate of the Government stated that the stagnation in the development of the motor-car industry, which was admitted on nearly all hands, had induced the Government to institute inquiries with a view to ascertaining whether anything could be done on the part of the Imperial authorities to support the industry, and what means could be employed in order to find new markets for manufacturers. With this object the Imperial Office for Internal Affairs has drafted a series of questions which it is proposed to put to manufacturers of motor-cars and their components and accessories. The questions for each of these groups will relate to the years 1901 (when the industry may be regarded as at its commencement), 1903, and 1906.

Municipal Motors for Toulouse.

The municipal authorities of Toulouse are showing great interest in the subject of municipal motor vehicles, and it is

engines up to 100 mm. bore; one over the same distance for 6½ metre cruisers having four-cylinder engines up to 90 mm. bore; one for cruisers up to 8 metres, and with engines with four cylinders up to 106 mm. bore; one for cruisers 8 to 12 metres in length and with four-cylinder motors up to 130 mm. bore; one for cruisers up to 18 metres and 155 mm. cylinder bore. All the above will be over a distance of 50 kilometres. The championship of the sea will be open to all classes of vessels, and will be over a distance of 200 kilometres. In addition, there will be several handicap events for cruisers and racers.

An Electrical Motor Street Washing Machine.

The first electrical motor machine for the washing of the carriageways of streets and roads has lately been placed in service in Berlin by the street cleansing department of that city. The machine, which was built by Messrs. Henschel and Co. in conjunction with Messrs. Gottfried Hagen, of Kalk, Cologne—the latter firm supplying the electrical part—is equipped with two 4-h.p. motors, which drive the front road wheels through gearing. The necessary current is supplied by a battery of forty cells, carried in a receptacle in the front part of the vehicle. The

controller is adapted to give five forward and two reverse speeds. The machine does not collect street refuse; it simply washes the roads, a tank having a capacity of 2,500 litres of water being provided. The water is forced out under hydraulic pressure through a sprayer at the front, the mud and slush being swept to the side of the road by a chain-driven rotating brush at the rear of the machine.

An Automobile Photographer's Outfit.

An automobile photography saloon, is the latest development in motorism. It is the production of a Frankfort-am-Main inventor, who, on a petrol motor chassis, has mounted a special body in which a dark-room, studio, arrangements for printing, and other accessories are provided. The studio is electrically lighted by current generated by the motor of the vehicle.

motor-boat exhibition is to be held in Antwerp from January 18th to February 10th next.—Under the name the Düsseldorf Electromobile Betriebs-Gesellschaft "Debag," a company has just been formed in Düsseldorf to establish a service of electric motor-cabs in that city.—The police in Paris have struck out on a new line, they having commenced to issue summonses against all chauffeurs who allow their engines to run, however slowly, when the car is at a standstill.—It is announced that a company has been formed in Athens to inaugurate a public motor-car service between that city, Marathon, and Thebes.—The Paris-Lyons Mediterranean Railway Company has just put in service in Paris a number of small motor omnibuses which are at the disposal of passengers.—The motor-car manufacturers in Austria have decided not to hold a show next year, while it is announced that the German Society of Motor

An Incident in the recent Austrian Manœuvres. — A Motor Lorry being driven over two planks thrown across a stream to form a temporary bridge. *[Allgemeine Automobil Zeitung.]*

Increasing Traffic in Paris.

In view of the increasing traffic in Paris, and especially on the Avenue des Champs Elysées, the Municipal Council has approved the construction of an underground passage across the Avenue at the crossing of the Rue Marbeuf, at an estimated cost of £2,680.

Miscellaneous Items.

According to a statement issued by the Automobile Club de la Sarthe the number of accidents in that department of France which took place during November last were:—Horse-drawn carriages, 18 accidents, 3 deaths, 16 badly hurt, automobiles, 2 accidents, 2 injured; cycles, 6 accidents, 6 injured.—The Dutch annual motor-car exhibition is to be held in Amsterdam from the 17th to the 26th January.—Arrangements are in hand in Brussels for the formation of a Belgian motor volunteer corps, to include both owners of cars and motor-cycles.—A

Car Builders have decided not to support another exhibition before September, 1909.—A parade of industrial vehicles is to be held in Brussels at the close of the Belgian motor-car exhibition.

In addition to building complete cars, the Star Engineering Co., Ltd., Wolverhampton, are now devoting considerable attention to the supply of motor-car components to enable small firms to build up their own vehicles. The new departure has been rendered possible by the policy adopted by the Star Company of standardising the various parts—engines, pumps, carburettors, gear-boxes, axles, steering gears, &c.—and having the means to cope with a large output, prompt deliveries can be made. The models at present being turned out comprise 9-h.p. two-cylinder, 13-h.p., 16-h.p., and 20-h.p. four-cylinder, and 30-h.p. six-cylinder. Any of the parts of these or the complete chassis can be supplied.

MESSRS. A. W. PATTERSON AND SON are making considerable alterations to their motor establishment in the Market Place, Baldock.

FOR placing broken bottles in the roadway to puncture the tyres of motor-cars and bicycles, five boys were fined 5s. each at Berks Petty Sessions, Windsor, on Saturday.

THE Bradford City Council have adopted a resolution prohibiting the use of the motor-cars owned by the municipality by their officials going to and from their homes.

MR. ROBERT COLVER, of the firm of Messrs. Jonas and Colver, Ltd., Continental Steel Works, Sheffield, has placed an order with the Daimler Company for a 42-h.p. chassis.

THE records made on the Brooklands track last week are to be attacked within the next few days, the success of Mr. Clifford-Earp having apparently whetted the appetite of many leading motorists for even greater speed.

BY courtesy of the directors of the Automobile Co-operative Association, Ltd., Mr. J. B. King has been permitted to use their offices and staff to facilitate the honorary work he is doing for the Motor Union of Western India.

WITHIN a few minutes' motor run from the Marble Arch Messrs. Crowe and Deerevel have an excellent garage and repair works. This is located at 36-38, Willesden Lane, Kilburn, N.W., and a special floor is being devoted to the careful storage of cars for the winter.

WE learn that since Mr. W. M. Letts's visit to Paris with the English Lorraine-Dietrich the French Company have taken orders for fourteen of these cars, and, in addition to this, Mr. Sangster, at Birmingham, has received direct orders from two French agents for nine vehicles.

THE year book and diary for 1908 of the Auctioneers' Institute of the United Kingdom comes to hand in its usual complete form, giving a topographical list of members of the institute, the usual diary pages with an alphabetical index for memoranda, and other matters, ample space for which is provided.

IN connection with the world's records which were announced in our last issue as having been made by Mr. Clifford-Earp, it is of interest to hear that the six-cylinder 60-h.p. Thames car was fitted with 6-inch Palmer cord tyres, which stood up well under the severe strain to which they were subjected. It is interesting to note that Mr. Earp adopted the larger size after first trying the car with 5 in. tyres.

AN examination was held at the Naval Motor School, Portsmouth, on Friday, the 20th inst., the candidates being principally petty officers and seamen of the Royal Navy who wish to become motor drivers after leaving the service. The names of successful candidates may be obtained from the secretary of the Royal A.C., 119, Piccadilly, W., or from the manager, Naval Employment Agency, 16, Craven Street, Strand, W.C.

MR. W. G. JAMES, of 14, Mortimer Street, W., has been appointed the sole London and district agent for the Rothwell cars made by the Eclipse Machine Company, Ltd., of Oldham. Three models are being made—15-h.p., 20-h.p., and 25-h.p.—all fitted with four-cylinder engines, the first being of the Aster type, while the latter are of the Eclipse Company's own construction. Throughout the vehicles are on up-to-date lines, every part being made in the works, including the bodies, except when customers desire special coach-work.

THE diary blotting pads of Messrs. Hudson and Kearns have proved their durability during many years, and having stood the test of editorial service may be regarded as likely to stand the wear and tear of any commercial office. These are issued in several forms, the most notable being the Bankers' edition, with leather corners, a pad diary and a date remembrancer, as well as a good thickness of blotting paper of real quality. No. 8a is another good style, this having white writing paper on one side as well as engagement and date slips and a full size pad. Maintaining the excellence of previous years these pad diaries of Messrs. Hudson and Kearns may be confidently recommended.

HERE AND THERE.

THE Aron Electricity Meter, Ltd., have brought out a taximeter which has been approved by the Commissioner of Police for the Metropolis.

THE gold medal of the Society of Engineers has been awarded to Mr. R. W. A. Brewer, for his paper on Liquid Fuels for Internal Combustion Engines.

THE Electromobile Company, Ltd., is providing motor carriages for ladies engaged in Christmas shopping, the charge being one guinea for the car and driver for four hours.

THE Maudslay Motor Company, Ltd., have received an order from the War Office for a duplicate of the vehicle which obtained a gold medal in the recent commercial vehicle trials.

NEW members of the Scottish Automobile Club include the Marquess of Tullibardine, the Earl of Kinnoull, the Earl of Northesk, Sir Basil T. G. Montgomery, Bart., Mr. A. J. Balfour, M.P., Lady James Douglas, Major Algernon R. Trotter, Captain John Gilmour, and the Hon. Lieut. J. Craik Taylor.

The 60-h.p. Napier Shooting Brake, built for Sir John Miller, of Heywood, Westbury, Wilts.

The brake holds from six to eight persons in the interior and two in front, is protected by a Cape cart hood and folding glass windscreen. Special arrangements are provided for carrying guns, luncheon baskets, carriage magazines, &c.

MR. ILES, a summer visitor to Nethybridge last July, who had his car upset near Dulnan Bridge, three miles from Nethybridge, but over the borders of Inverness-shire, is suing the Elgin County Council for £550 damages alleging road neglect.

A BURGLARY was committed during the week-end at the residence of Lord Lonsdale, Barleythorpe Hall, near Oakham. The thieves are believed to have been a London gang, who used a motor-car in getting away from the place.

No more convenient or enjoyable method of "seeing Japan" can be conceived than that of motoring through it at leisure in a good car. Distances are not too great, the tourist traffic has brought about a very good system of foreign-style hotels, some of which compare very favourably with the first-class hosteleries of Europe, and, though often difficult of access, practically all the famous beauty spots can be reached by motor-car in far more comfort than can be supplied by the narrow gauge railways or the jolting ricksha.

THE Isle of Wight Express Motor Syndicate, Ltd., is being voluntarily wound up.

MR. A. K. STOTHERT, head of the engineering firm of that name at Bath, has ordered a 30-h.p. six-cylinder Napier.

FIVE motor-vans are now in use for the delivery of books to the sub-stations of the public library of Chicago, U.S.A.

SIR FREDERICK TREVES, BART., has been through a course of motor instruction at the Motor Schools in Heddon Street, W.

MESSRS. R. J. MCCRERY AND J. C. PERCY will hold a concert in connection with the Dublin Motor-car Exhibition on the 8th prox.

MESSRS. D. BRADBURY JONES AND Co., of the West Wales Motor Garage, Carmarthen, have hiring-out motor-cars in charge of experienced chauffeurs.

A GARAGE LAMP, on the miners' lamp principle, has been placed upon the market by Messrs. George Polkey, Ltd., of the Hockey Lamp Works, Birmingham, who are also introducing a smart set of five lamps for the car at a very reasonable figure. In our advertisement pages last week the Projector was illustrated, as well as the square pattern side lamp. By an inadvertence the illustration of the tail lamp was incorrectly given, this being of similar style to the side lamp.

AN unusual sight was witnessed on Broadway, New York, recently. Three large electric wagons were paraded down the chief thoroughfare of the city, each bearing as its burden of triumph two large dray horses, and hauling in the rear the old-fashioned vehicles which the motor-wagons have supplanted.

WE understand that Argyls, London, whose headquarters at 17, Newman Street, W., are known to most Metropolitan motorists, intend to develop a touring department next season.

THE municipal authorities of Cincinnati, U.S.A., have contracted for the purchase of four 5-ton motor-wagons for the use of the Street Cleaning Department for the collection of dust and street refuse.

A REPEAT order for two traveller's broughams has been placed with the Albion Company, Ltd., by Messrs. Anderson and Thomson, of Aberdeen, through Messrs. R. and J. Shinnie, their agents in that city.

A SCHEME for the construction of a special motor track from South Shore, Blackpool, to St. Anne's has been suggested locally. It is estimated that to construct such a track, $3\frac{1}{2}$ miles in length, a cost of £24,000 would be incurred.

THE VICTORIA CARRIAGE WORKS, LTD., sole concessionaires for the Leon Bollee cars, have just supplied two of these well-known cars to Mr. Phillip Saillard, of Buchan Hill, Crawley, the successful exhibitor at agricultural shows. The vehicles will be fitted with handsome limousine and a Roi-des-Belges touring car bodies respectively.

AT the rear of the Pulteney Hotel at Bath is the Pulteney Motor Garage, with which Messrs. Whiting's motor works have been incorporated. The building has a bold frontage overlooking Henrietta Park, and has a private entrance from the hotel. There is accommodation for about thirty cars, and in Milk Street the proprietors have a repair department well equipped for dealing with all classes of motor mishaps.

THE diaries and tablet calendars for 1908 issued by Messrs. Thomas de la Rue and Co., of 110, Bunhill Row, E.C., are of the usual excellence and variety. The "Index Diaries" have a novel cut index, by means of which any month can be turned to immediately; the "Traveller's Diary" also has an index as above, and contains, in addition, matter of interest to English travellers. "Portable Diaries," specially intended for gentlemen's coat pockets, being of ample size, yet very limp and thin, are also included among the selection, in which several miniature purse calendars are noticed. The publishers also issue a series of diary engagement blocks of good design and execution. For many years Messrs. Thomas de la Rue and Co., Ltd., have been concerned with the issue of annual publications of a high grade, and the books for 1908 are well up to the standard of previous editions.

MR. C. JARROTT has offered the Motor Cycling Club a new trophy for next season.

REPAIRS to motor-car machinery are now being carried out by Messrs. S. and H. Brown in Lincoln Road, Peterborough.

THE fire authorities of Montreal, Canada, have decided to purchase two motor chemical wagons for use in outlying districts.

SIGHT-SEEING motor-vehicles have proved a financial success in the cities of New York, Philadelphia, Boston, Washington, and Denver.

THE Valvoline Oil Company is using a motor-lorry for long-distance delivery work in New Jersey, U.S.A., and states that it has replaced three two-horse teams.

THE Royal A.C. has decided to refuse sanction to any competition on a public highway or foreshore where the approval of the local authorities has not been previously obtained.

MESSRS. P. BARRETT AND Co., Carrick-on-Shannon, have a good stock of motor accessories, spirit, and oils, and are also undertaking the conversion of ordinary boats to motor-boats.

A FACTORY for making Dunlop tyres is about to be established in Japan, the Dunlop Pneumatic Tyre Company having made alliance with influential people in that country for the purpose.

NEARLY 600 drivers employed by the General Motor-Cab Company, Limited, were entertained to dinner at the Holborn Restaurant, London, on Tuesday. The chairman, Mr. Davison Dalziel, impressed upon the men the importance of being polite to their "fares" and the public generally.

A 12-14-H.P. KRIEGER petrol-electric car has been undergoing a six days' trial under Royal A.C. observation. A start was made on Monday from the Club's Motor House, and the journey was for 100 miles in the country—fifty miles out and back, on the Oxford road. Tuesday's was for a similar distance on the Coventry road. Five days are being devoted to the running of the car in the country, and one day will be told off for a test in London traffic. The car, which under R.A.C. rating is 17.49-h.p., is entered by Mr. F. Combemale.

WE illustrate herewith a valve dressing tool which has lately been put on the market by Mr. F. G. Crone, of 49, E. Utica Street, Buffalo, U.S.A. It is designed for the redressing of warped valves and their stems and the avoidance of the necessity for grinding too great an amount from the valve seats when they are found to be warped. It is made in one size and will accommodate valves of $1\frac{1}{4}$ to $2\frac{1}{2}$ in. diameter of the head and stem sizes between $\frac{1}{4}$ and $\frac{1}{2}$ in. As will be seen from the drawing, the adjustment for the valve stem diameter is made through conical sleeves and balls. An adjusting screw at the lower end

of the device limits the amount which can be removed from the valve face. The head in which the cutting edges are provided is detachable from the part carrying the stem of the valve, and is secured thereto by a quickly-detachable hinged clamp. The conical surface cutter may be had in any angle desired. As a complement to this tool a cutter is also provided for redressing the valve seats in the cylinders. This cannot, of course, be made to redress any great number of sizes of valve seats, and is made specially for the size to be redressed. A set of stems for the guidance of this tool in the valve stem guides is furnished, they being attached to the cutter proper by a screw joint drawing upon a taper.

THE HIGHWAYS OF KENT.

"To invite anyone to a saunter through Kentish byways, or even to a motor-scurch along Kentish highways, is to invite them into a country that has beauty, and varied beauty, to offer to the eye at all seasons of the year; but it is to invite them also to a country rich in matters that appeal to the imagination, a country in which the making of history has been carried on for close upon twenty centuries, and one rich even in those relics which tell of earlier unrecorded times 'when wild in woods the naked savage ran.'"

THUS Mr. Walter Jerrold introduces his pleasant gossip guide* to the ancient and variegated orchard of England—a county with an area of 1,624 square miles of fertile surface, fragrant hedgerows, apple orchards, and hop fields. Kent is justly esteemed in our island story. It

The Village of Biddenden.

began almost with the beginning—certainly it was the first corner of the country to entertain Romans, at first, unawares. Historic associations lurk in many an ancient hall and noble mansion of Kent; and they are all made accessible to the dweller in other shires who has the motor-car at command. Not only are the towns and villages of historic interest, but the roads have their memories too. Here the Romans tramped on their way to the little settlement on the Thames, now grown into the capital of an empire; there Chaucer's pilgrims might be met on their jaunt from Southwark to Canterbury. Canterbury itself is full of associations with the past, and although Mr. Jerrold writes lovingly of the city which sheltered the Walloons and protected the Huguenots, his pages cannot supplant Dean Stanley's Memorials of Canterbury, with their wealth of antiquarian lore and graphic descriptive power.

Canterbury is quiet and quaint, many of its old houses "bulging" out, to quote the description by Dickens, who immortalised most of these parts of Kent. Many of its citizens have little sympathy with the modern world, and, according to our "Highways and Byways in Kent," a zealous antiquarian suggests that motors, which he regards as "throbbing, noisy, evil-smelling machines," should be kept outside the city, their presence being a "vulgar and irreverent anachronism." Such view would not be shared by any of the Bishops who use automobiles in the course of their diocesan visitations, and would probably be controverted by those who, like Canon Hicks, of Lincoln, often drive their cars around the cathedral Close. No, good antiquarian! progress will invade even the most musty and crusty areas, and is no respecter of the ancient order of things, in which fact the modern man considers himself fortunate.

But Kent is not all highway; there are quiet lanes with high hedges such as are depicted in Mr. Hugh Thomson's sketch of a Kentish byway—one of those well-made roads that are under the

control of Mr. H. P. Maybury, but with hedges that obstruct the view ahead and offer risks of disaster should speed be attempted.

In the course of a score of chapters Mr. Jerrold tells his story. That on Lympne to the "Dens" is one of the most interesting, where all are good, and the following quotation characteristic of his style:—

"If Romney Marsh has charms that grow upon us, there is perhaps even more that is attractive—greater variety of immediate surroundings and the added views—from the hills that lie close inland from the neighbourhood of Hythe to near Appledore, at the further end of the demi-lune. It is a district of open fields, of flowery hedges, of woodland hollows, and strips of shaws along the fields, of dipping and rising lanes and small but pleasant villages, with occasional magnificent views over the wide extent of Romney Marsh. Leaving the narrow main street of Hythe by a broad and rapidly rising highroad trending inland, we may come to this district, or following the low road by the canal we may reach West Hythe, the earliest successor as port, it is believed, to its once important neighbour Lympne, now but a small village. The hills rise somewhat sharply along this part of our journey, and before visiting the Richborough ruins it is well to see them from below and to recall that this was in Roman times a port, either a bay or, as some suppose, the estuary of the Rother, which, it is thought, may have flowed out here before it took to erratic ways. Archaeologists have discussed the matter with various theories, and readers who would learn further details of these Roman remains—Reculver, Richborough and Lympne—should read the book on the subject, published in 1850 by Charles Roach Smith, referring for later researches to the rich volumes of the *Archæologia Cantiana*. Here we must be satisfied with a glimpse at the ruins, greatly changed, it must be remembered, by landslips during the many centuries that have elapsed since the last of the Romans left this outpost of their empire. Now high and dry some miles inland it is difficult to realise that Lympne was one of the great keys of Britain, equal in importance to Dover and Richborough. It is curious that a corruption of the Roman "Portus Lemanis" should remain in Lympne on the heights above, but that the cast-ruin itself should have taken on the new name of Stutfall or Studfall."

A Typical Byway.

And then by the way of Lympne Castle the motorist—for only he can properly see and know Kent—is taken a couple of miles to Westenhangar, where we are on the Stone Street that runs straightly, through Stanford, about a mile beyond, north to Canterbury. Roman settlements abounded in that part of the county, as ample remains now prove. Legends of old-time worthies are equally plentiful, while at Aldington are memories of Erasmus, who held the living for a few months. Several ad-

*Highways and Byways in Kent, by Walter Jerrold, with illustrations by Hugh Thomson. London, Macmillan and Co., Ltd., 1907.

adjacent places bear the name of Hurst, indicating the well-wooded nature of the scenery, and it is a capital little run to Bilsington. "From Bilsington," says the author, "pleasant wooded roads go north past small retired hamlets and farmhouses to the valley of the East Stour and Ashford, but, keeping roughly parallel with the canal, we pass where we come nearest to that waterway, through Ruckinge, and a couple of miles beyond reach the railway (Ashford and Hastings Branch of the S.E.R.), at Ham Street. From here our road loops in again past Warehorne and Kenardington—both showing picturesquely grouped in trees—on by-roads towards the Marsh. Warehorne was at one time the scene of a fair of some importance in the district. At Kenardington, which is now a small village, but when the Rother came nearer may well have been of greater importance, the Saxons are said to have raised earthworks against the Danish invaders. The journey from Ham Street to Appledore may be made almost entirely by foot-paths, giving more intimate knowledge of this country, where the wealden woodlands are merging into the marsh levels."

Then come Tenterden, Newenden, Rolvenden, Bevenden, Biddenden, Halden and a dozen other hamlets that once stood boldly to the world but now rest on their former greatness. Legends link them with the past. Tenterden steeple and the Goodwin Sands are indissolubly associated, and then there is Biddenden and the tradition of the two maids who lived together in the twelfth century much after the manner of the "Siamese twins," the "two-headed nightingale" and other misfortunate monstrosities of later years. Another chapter of attractive reminiscence is that concerning Otford and "the

H. Johnson.

Quintain on the Green at Offham.

"hams"—Warham, Ightham, Wrotham, Offham and half-a-dozen more hamlets of similar termination.

The splendid palace of Warham was visited by Henry VIII., and was duly handed over to him by Cranmer with various other archiepiscopal properties. All that now is to be seen is a group of picturesque ruins near the church overlooking the Darent, where the old-time Pilgrims' Way crossed the stream, and backed by the rapidly rising, tree-topped downs. Approaching the railway station from the south the nearer spur of those downs looks not unlike Box Hill as seen from the Dorking road. Along the Pilgrims' Road, keeping, as usual, to the hillside, roughly midway between the higher ground and the valley, we may pass into comparative solitude for some miles, meeting but few people, and seeing but few cottages, for, as usual, the inhabited road passes parallel with the old way at a short distance—here sometimes less than a quarter of a mile—to the south. Shortly after leaving Otford, however, the spire of Kemsing Church is seen, and here we are at a very attractive little village lying half a mile or so from the railway station. . . . From Seal to Ightham a beautiful four mile walk may be taken nearly all through the fine woods, either directly following the road over the hill, or turning to the left half-a-mile beyond Seal a lower way may be taken by Styants' Bottom. For a cyclist I would recommend the main road, for I can recall on one occasion having to push my machine along rutty, stony ways for a considerable distance only then to have to turn back and rejoin the open road. Either way takes us to Oldbury Hill, a famous spot owing to the extensive pre-Roman camp here, the entrenchments enclosing more than one hundred and twenty acres. Part of Oldbury Hill has been extensively quarried for stone for "metalling" roads, and especially was this done when much of the stone was taken in 1844 for macadamising the Edgware road."

Just beyond Wrotham the Pilgrims' Road takes a northward bend—seemingly for the purpose of keeping at its usual middle distance between the hills and valley; but following the road above it up Wrotham Hill we get magnificent views to the southwards over the Hurst and Mereworth Woods to the left, and the woods and parks on the hills about Sevenoaks, while between we have the break of the Shode valley. Here we are on the chalk, with roads running north to the Thames by Gravesend and Dartford, the nearest villages being the small Stansted with its thousand-years-old yew, Ridley, and Kingsdown, with its plain little church in the woods. Returning to Wrotham we have within three or four miles to the east—near to our Maidstone district at the Mallings—Trotterscliff, Birling, Ryarah, Addington, and Offham, a small group of places particularly attractive to those interested in megaliths, or rude stone monuments of pre-historic people."

These are delightful rambling grounds, where the car can be left while byways should be traversed afoot for the new impressions that come upon the vision with every turn. If the impressions are new, the actualities are ancient, for on the hill to the north of Trotterscliff is the Coldrum cromlech and many Romano-British remains. To the east, on the other side of the Medway, is Kits Coty House and the Countess Stones once thought to have association with the Coldrum cromlech. In fact, the whole district is one of hallowed sites which should quicken the blood in the way that Dr. Johnson declared it should rise at Iona. These strange survivals of a savage past seem curiously impressive in the rich scenery of diversified woodlands, pastures, cornfields, and hop gardens of the present. Some of the relics of our ancestors are associated with their sports as well as with their religious rites and funeral ceremonies, and

"On the green at Offham is a curious survival of one of their games in the shape of a quintain, which has been maintained for centuries at the cost of the estate on which it stands: this is a tall post with a cross-piece pivoted at the top, broad at one end, and pierced with holes. At the further end of the cross-piece hung a bag of sand, and the agile youth of the neighbourhood up to the end of Tudor times used to exercise themselves and their horses in tilting at the broad piece of wood, 'he that by chance hit it not at all was treated with loud peals of derision; and he who did hit it made the best use of his swiftness, lest he should have a sound blow on his neck from the bag of sand, which instantly swung round from the other end of the quintain. The great design of this sport was to try the agility of the horse and man, and to break the board, which whoever did he was accounted chief of the day's sport.'"

And thus across more than 400 pages Mr. Walter Jerrold discourses of the ancient lore and modern semblance of one of our best known counties, the roads of which are a delight to motorists, with a fine firm surface and generally ending in good inns for man and convenient garage for motor-car. For Kent is up-to-date despite its long lineage and ancient renown. To the graphic pen of Mr. Jerrold the facile pencil of Mr. Hugh Thomson has been added, a literary and artistic combination that has resulted in one of the most delightful of this series of travel books published by Messrs. Macmillan and Co., Ltd., by whose courtesy our readers get a glimpse of the pictures with which it is embellished.

MR. NORMAN CROSSLAND, 54, Deansgate, Manchester, is making an attractive offer to reduce the expenses of motoring for those who purchase cars from him.

MR. W. O. DANCKWERTS, K.C., has placed an order for a 40-h.p. Piccard-Pictet six-cylinder landaulet with Messrs. Donne and Willans, the exclusive agents for this vehicle for the United Kingdom.

MR. EDWARD MANVILLE, the chairman of the Daimler Motor Company, has been included in the series of articles on Midland Captains of Industry now appearing in the "Birmingham Daily Gazette."

A MOTION that the Law and Parliamentary Committee should consider the question of the damage that is done by the G.E.R. motor-buses has been rejected by the Eastern Highways Committee of the Norfolk County Council.

A MOTOR delivery van specially designed for carrying pianos has lately been put in commission by the Mason and Hamlin Company, of Boston, U.S.A. It is of 16-h.p., and can carry two grand pianos. It is said that with this vehicle a delivery that formerly took half a day can be completed in two hours.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

SUBSTITUTES FOR THE DIFFERENTIAL GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the article on "Substitutes for the Differential Gear" in the *M.C.J.* of the 7th inst., which alludes to the Hedgeland equaliser, will you allow us to supplement what you write by the following? Without departing from the underlying principle contained in the axle, which was submitted for trial by the Royal Automobile Club in 1906, Mr. Hedgeland has re-designed the device to enable it to be substituted for the differential gear, both in the floating type of cardan-driven axle and in the chain-driven type, so as to enable manufacturers to satisfy themselves, after trial, of the soundness of his principles. One of the modified designs is shown in your article on p. 897, but in Figs. 2 and 3 the diagrammatic sketches have been inverted; that shown in Fig. 2 should be described as "driving ahead" in place of "turning," and that in Fig. 3 as "turning" in place of "going straight ahead." It will interest many of your readers to learn that we hear this week of one of the original equalisers completing 35,000 miles to the satisfaction and delight of its owner.

After a long series of trials on many types of cars, the fact that the power of the engine is transmitted through the wheel which has the greater adhesion to the ground, and not, as in the case of the differential, through that which has the lesser adhesion, has proved the superiority of the device over the differential. On a six-cylinder

the winter season. The warming of either a closed or open car ought to be an easy matter, yet little seems to have been done to make use of the waste heat of the engine to enhance the comfort of the passengers. More than two-thirds of the heat generated in a petrol engine cylinder goes to waste, about half of this amount passing through the cylinder walls to the cooling water, the other half being carried away by the exhaust gases. A good heating effect could undoubtedly be secured by placing the radiator in the position of the dashboard. If a fan was placed in front of the radiator, practically all the heat from the latter would have to be carried through the body of the car, and a very considerable heating effect would be assured. Also, if there were regular openings near the top of the vehicle the circulation would be sufficiently active, so that no inconvenience from engine fumes need be feared. Most cars, however, have their radiators at the front of the engine bonnet, and to put the radiator in the place of the dashboard would be next to impossible. What could possibly be done in many instances would be to remove a section of the dashboard and close in the engine space all around by suitable leather aprons, so that the air drawn through the radiator would have to pass out of the engine space through the opening in the dashboard. Another scheme, which has been applied to some extent, is to provide the silencer with a jacket and locate it directly underneath the footboard. The air in the jacket becomes heated and passes up through a grating in the footboard. In this way also a tolerable heating effect ought to be obtained. The principles involved

TOURING IN ITALY.—TWO VIEWS OF LAKE GARDA.

car which was capable of being waltzed end for end by its driver on greasy sets, the application of the Hedgeland equaliser rendered that manoeuvre impossible; and in a report from the makers of the car it was stated "it was much in advance of the usual axle fitted with the differential. I particularly noticed this on roads that were greasy, and I am certainly of the opinion that side skids are greatly prevented by its use." The report adds that when the engine is pulling the drive appears to be more even on both back wheels. There is no doubt that the substitution for the differential of a device which is as reliable, and which abolishes the well-known disadvantages and dangers due to the differential, will be a great step towards increased simplification and safety in the motor-car. An equaliser which at the same time will enable a solid axle, driven centrally by worm, chain, or gear, to be adopted, will conduce to the lessening of troubles, cost of upkeep and transmission losses. Another point which cannot be disputed is that, since one wheel cannot be driven faster than the other, and yet is capable of revolving freely faster than the other, it reduces to a great extent the destruction of tyres by the overdriving of one wheel through the differential.—Yours truly,

HEDGELAND AND CO., LTD.

WINTER MOTORING AND THE HEATING OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that motor-cars are no longer summer playthings, but are used all the year round, I am surprised that more attention is not paid by manufacturers to the provision of means of heating vehicles during

in heating a car by means of the engine waste heat are simple enough, but their application in a workmanlike manner requires considerable skill, and if any motorists have had a heating arrangement fitted on their cars, perhaps they would kindly send you particulars for publication in the correspondence columns.—Yours truly,

R. J. J.

LOW TENSION MAGNETO TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you will advise me in regard to a Richard-Brasier car with a four-cylinder engine of presumably 16-h.p. There is only one ignition fitted, viz., Siemens-Bosch low tension magneto, and the trouble is, it will only fire on two cylinders. I have only just taken the car over, but believe that for the last few months it has been working so. I have taken the magneto to pieces, cleaned and replaced it, and the engine will run on each cylinder separately, but when they are all connected will only fire on the front two. I believe the magnets are magnetised, but it does not appear to spark well. I have renewed the tappets and plugs, and ascertained that they work correctly.—Yours truly,

FRANK.

[Has our correspondent tested the timing by the marks on the rim of the flywheel? We believe that all Richard-Brasier cars have the proper setting of not only the valves, but also the ignition, clearly marked on the periphery of the flywheel. If each cylinder will fire all right when run separately it is really difficult to say with-

out examination why there should be trouble with the rear pair when all are coupled up. Is the armature geared to "break" at the point when the magnetic field is most intense? Is "Frank" sure that, in spite of each tappet working correctly, there are not two which overlap in timing? A badly-adjusted carburettor will sometimes give most extraordinarily erratic results in firing, and, by firing on two cylinders only, lead one to assume that it is the ignition which is to blame.]

A CARBURETTOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just purchased an 8-h.p. single cylinder M.M.C. car and there appears to be something wrong with the carburettor, which is a Longuemare. Owing to the engine using a very great quantity of petrol to the mile I began to look for the cause, and find that when the car is standing and the engine throttled down, a quantity of petrol spits out through the holes in the bottom of the chamber next the float chamber. I should be very glad if you or any of your readers could tell me how to remedy this.—Yours truly,

NOVICE.

[Our correspondent's carburettor is evidently not suited to the engine, and the most probable reason is that the air cone over the jet is too small. All Longuemare carburettors have a series of jets and air cones adapted to each size, and unless the correct pair are used in conjunction a satisfactory mixture is impossible.

We advise "Novice" to secure the next number larger air cone, and also at the same time the next smaller number jet. Various combinations can then be tried, and we have no doubt he will thus be able with a little patience to hit on the correct sizes of each best suited to his engine. It is also, of course, possible that the weight on the needle in the float chamber may require shifting, as to height, if the level of the spirit is

A Vinot Car with special Limousine Body by Messrs. Coles and Sons Kensington, exhibited at Olympia.

too high; but we recommend him trying the other alternative first, as being the most likely reason for the abnormal fuel consumption, and the flooding at the mixing chamber when throttled down.]

ENDORSEMENT OF LICENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently forgot to renew my driving licence and was fined 2s. 6d., and costs (the magistrate accepting my explanation) and my licence was endorsed.

May I ask through your columns:—Is such a course usual, and is it legal? Also is it worth while or of any good to take any steps to get this altered?—Yours truly,

J. S.

[This is one of the cases where the magistrates have no option in the matter. They "shall cause particulars of the conviction to be endorsed upon any licence held by him." So that when a person neglects to renew the licence, which, by the way, lasts for a year from the date on which it is granted, the offence must be entered when conviction takes place. This is one of the technicalities as to which magistrates might be granted some discretionary powers instead of being forced to perform what they often regard as an injustice.]

VALVE SETTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed that there is a great deal of doubt as regards the setting of inlet and exhaust valves, and that the instructions usually given are very loose, e.g., when the piston is about an inch from the bottom, &c. Now surely the correct setting of valves should be a matter of extreme accuracy, in which guess-work should be entirely eliminated? I think it would be most interesting and instructive if some of the leading manufacturers, such as Iris, Napier, Humber, Daimler, Darracq, &c., were to join in a little discussion on this subject, to see if any rule could be laid down. At present hardly any two makers set their valves alike: a cursory inspection at the recent show revealed the fact that in high-speed engines the tendency was to open

the exhaust valve early and close it early, about $\frac{1}{4}$ in. from the top of the stroke, the inlet valve opening $\frac{1}{4}$ in. on the down stroke and closing $\frac{1}{4}$ in. or perhaps a little more on the compression stroke: the slower running engines with long strokes appeared to open their exhaust valves $\frac{1}{2}$ in. down and close either on the dead centre or just over—i.e., a shade late, the inlet valves in this case opening a shade late, about $\frac{1}{4}$ in. or $\frac{1}{2}$ in. on the down stroke, closing on the dead centre exactly. Then, again, I found some engines which opened their inlet valves before the dead centre, and before the exhaust valve was quite closed! I think it would be most interesting to hear the many different views on this subject.—Yours truly,

AN INTERESTED ENQUIRER.

ARE TWO IGNITIONS NECESSARY?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question raised by your correspondent, Mr. J. Worthington, is surely one of interest to all motorists, and deserves, I think, a little discussion. It is a generally acknowledged fact that a low-tension magneto ignition is the more reliable of the two when pitted against a high-tension magneto. Why? Simply because it has proved itself so—which provides as good a reason as we could desire. Moreover, it is practically only within the last couple of years that the high-tension system has been able to lay any reasonable claim to reliability at all; although I personally know more than one high-tension magneto I should be quite content to have on my car with no other type.

But allowing for the imperfections of one and all systems, I should advise those who can afford it to have two distinct types, unless they have only the ordinary high-tension ignition, when, by carrying a couple of charged accumulators and a few necessary spares, they are perhaps better off than if they had both a low and a high tension magneto. Certainly it is false economy to have two ignition systems which are not totally distinct from each other. If one coil and distributor is used for two systems and anything goes wrong with it, where does your duplicate ignition come in?

The objections Mr. Worthington puts forward against a double set of sparking plugs are easily got over. No driver having two ignition systems on his car should leave one type idle for any lengthy period. If he has high-tension magneto and a separate coil and accumulator system, for example, not only is it easier for him to start on the accumulator system, but he should make a point of *always* doing so, for it ensures it being in working order and guards against his forgetting to charge the accumulators when necessary.

Again, if the magnetic plug could prove its reliability I think it looks as if the low-tension magneto will attain a new lease of life and entirely put the high-tension model in the shade. Anyhow, it all goes to show that the whole interesting question of "Which Ignition?" is still unsettled.—Yours truly,

J. MORSE SCOTT.

ACCUMULATOR CHARGING FROM PRIMARY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you assist me with any hints on the charging of accumulators? I have a four-cell charging battery fitted with an adjustable wire coil resistance, but when newly charged, as per directions, I find that with the full resistance interposed there is still a current of about eight amperes, which is more than double the charging rate of my cells. What I wish to know is whether I can connect two cells in series, and let the full eight amperes through, so allowing four to each, which is full charging rate; or if not, how can I reduce the current?—Yours truly,

S. H.

[When a good primary battery is made up with fresh solutions, it gives its maximum voltage, and therefore offers a low opposing electromotive force to the primary battery, an excessive rush of current being the result. To overcome this difficulty, it is best to connect up three instead of four cells of the primary battery to the accumulator. This can easily be done, as the battery mentioned by our correspondent is provided with separate terminals to each cell. After some little time the voltage of the cells will fall, and the voltage of the accumulator will rise, causing a fall in the strength of the current, in which case the fourth cell can be put in and the accumulator left until it is charged. In his query "S. H." asks if he can connect two cells in series, but evidently two cells in parallel is meant, as it is only by connecting them thus that the current can be divided between them. This, however, would not help, as by so doing the opposing voltage is reduced. Connecting three cells up is the best method, and the resistance can be used to obtain exact regulation of the current.]

MICA WIND SCREEN.—We have an inquiry for the name and address of the maker of a mica wind screen, and shall be pleased to forward any information on the subject to our correspondent.

GEARS AND GEARING.*

BY F. HUMPHRIS.

THE title of my lecture should have been "Toothed Gears and Gearing." It is with the efficiency and durability of toothed wheels as used in automobile constructional work that I am to deal. Gear wheels must be defined as devices for transmitting continuous motion from one fixed axis to another by means of engaging teeth. Thus confined, gear wheels may be conveniently divided into three general classes: skew bevel gears, transmitting motion between axes not in the same plane; bevelled gears transmitting motion between intersecting axes; spur gears transmitting motion between parallel axes.

Wheels are constructed upon theoretical principle of discs having no teeth. These discs are imaginary in actual practice, although they are one of the principal elements of the theory, and they are called axoids, or pitch cylinders of the gears. These two cylinders that can roll on each other will transmit a rotary motion from one end of the fixed parallel axes, and to the other if their surfaces are provided with engaging projections. When these projections are so small that they are imperceptible, the motion is said to be transmitted by friction, and it is practically uniform. A microscopic observation of any two apparently highly polished surfaces will reveal the fact that in reality they are not perfectly smooth. But when these projections are of large size and readily observed, the motion, although unchanged in nature, is said to be transmitted by direct pressure, and it is irregular unless the active surfaces of the projections of teeth are carefully shaped to produce an even motion. It is upon this theory of being carefully and correctly shaped that a tooth gearing must be constructed to give good results, and it is also necessary that it must maintain its configuration and correct curves throughout its whole life, or otherwise a tooth gear begins well, not perfect, and rapidly becomes worse and worse.

The important point is as to whether a toothed gear becomes less efficient as it becomes older, and whether it maintains its correct curves in a sufficiently practical form to leave it in the field of mechanics unchallenged as a motion. My own views are that the tooth gear is the most imperfect motion employed in automobile construction when it is constructed upon the orthodox lines.

The basis upon which ordinary tooth gear is constructed is that of two circles or cylinders rolling upon one another, thus obviously giving the smallest contact surfaces or area that can be contained. This system gives results entirely dependent upon the perfection of the true tooth curve, and can only give its theoretical result when the wheels are new, the reason being that there is only a line of contact to take up the greater part of the sliding motion. These curves represent two convexes rubbing upon one another, and it is necessary that these curves should remain as they were first designed, or otherwise the velocity ratio between them will keep getting worse and worse. In practice, it is not possible to maintain this theoretical curve. There is no wheel that ever has been made, or that ever can be made, which has for its basis curves engaging and sliding in opposition one on the other.

If the motion of two wheels' teeth engaging were entirely confined to that of a rolling character their life would be practically everlasting. Therefore, to be able to improve upon the system of ordinary tooth engagement and retain all its advantages without any of its disadvantages, should be the aim of all engineers who are interested in transmitting power by these means; but to do this would necessitate making a gear the teeth of which have less sliding upon one another, with an area or surface in contact of greater dimensions than teeth of the ordinary kind, also with a greater strength, a less amount of weight, a reduction in the number of engagements for the same amount of work done, and teeth which, with all these qualifications, will not change in form when worn and destroy the curves necessary to their perfect working and engagement. This can only be done by making the true tooth curves in sympathy with the mating member upon which they engage instead of in opposition, as in the ordinary form of tooth engagements. I have designed a toothed wheel of this description, and have put it to the most severe tests. The tooth to which I refer is circular in cross section with a hemispherical or ball-end addenda, the said tooth wheel engaging in a plate having circular holes, and being driven at right angles from the propelling shaft. The results of this test show a very small amount of loss in transmission, and an almost imperceptible amount of wear. A lesser angle of obliquity (or power absorbed as thrust) can be obtained than when the ordinary formula and shape of tooth is employed. This lesser angle of obliquity carries with it some very remarkable values, as the power delivered from one wheel to the other is more in the direction of the driven wheel, with a corresponding increase in efficiency. A smaller diameter pinion can be used with larger and stronger teeth. And in proportion to the lesser angle of obliquity so is the amount of slip, or the sliding of one tooth upon the other, which slip occurs over an abnormally large area, and, therefore, ensures less wear and less friction. This result is obtained by establishing an entirely new formula and shape of tooth. The underlying principle of tooth formation is that the action of the teeth shall, as nearly as possible and practicable, approximate to the smooth motion that the peripheries of friction wheels would give if working perfectly when engaged in mutual contact. Though this may seem easy of attainment, it is not at all easily or readily accomplished in fact. For, apart from the question of mere engagement of teeth, there is this result, that the forces which

act normally to the tooth curves operate in oblique directions and only for an instant perpendicularly to the line of action. The amount of diagonal thrust will depend upon the form given to the teeth, and it is desirable for obvious reasons to keep this angle of obliquity as small as practicable, as the less it is the more efficient becomes the transmission. Intimately related to this is the breadth of the teeth at the roots, increase in which conduces to strength. With the circular tooth having a somewhat bell or helmet shape, and an addenda hemispherical and engaging in a round hole, all these necessary conditions can be not only conformed to, but improved upon, when the teeth and holes are constructed upon a formula giving sympathetic curves. The tooth action, instead of being curved in opposition, as in the formula for ordinary tooth gears, is curved in sympathy.

"ELECTROMOBILE" AS A NAME.

IN the Court of Appeal, on Monday, the appeal of the plaintiffs was heard in *Electromobile Company, Ltd., v. British Electromobile Company, Ltd.*, from a refusal of Mr. Justice Warrington to grant an injunction restraining the defendants from using their present style, on the ground that it was calculated to induce customers to believe they were dealing with the plaintiff company.

The contention of counsel for the appellants was that confusion was inevitable from the use of the word "Electromobile" by the respondents. Lord Justice Vaughan Williams pointed out that confusion was a question of degree. The risk was great when a fancy word was used but not so great when a word was used which was neither fancy nor geographical, but merely of a character descriptive of the machinery.

Without calling upon counsel for the respondents, the Court dismissed the appeal.

Lord Halsbury said the question raised was simply one of fact and not of law. In his view there was no reasonable probability of confusion

The 15-h.p. Coventry-Humber recently supplied to the Duke of Atholl.

between these two names. The appellants had adopted two words—"mobile" a good classical French word, and "electro," which was pretty well appreciable all over the world to electricity, and those words purely signified the qualities of the carriage. He did not believe that a word which was, as was admitted, a generic word describing a car run by electricity in 1902 had since then become specifically appropriated to one particular company, so that it might lead to the public being deceived if used by another company. If the name sought to be restrained was one which simply conveyed the qualities of the thing, it became extremely difficult to say, and required very strong evidence to establish, that it would deceive. He did not deny that a person might even be restrained from using his own name in certain circumstances, but those circumstances did not arise here.

The Lord Justice and Mr. Justice Bigham agreed, and the appeal was accordingly dismissed.

CONTINENTAL tyres were again top scorers at the Berlin International Exhibition by an overwhelming majority.

ON the 13th inst. a joint dinner of Messrs. S. F. Edge (1907), Ltd., and Messrs. D. Napier and Son was held at the Trocadero Restaurant, London, when, in reply to the toast of his firm, Mr. M. S. Napier reviewed its history over the last century, recalling some intricate pieces of mechanism which they had made before they took up motor-cars ten years ago. He described his meeting with Mr. S. F. Edge when that gentleman was driving a car of the early type which to Mr. Napier's eye looked like a "racing cottage." At the call of the chairman, Mr. S. F. Edge, the staffs of the two firms present at the dinner joined in drinking the toast of "The Napier car right ahead in 1908."

A DEPARTMENT of the business of Messrs. Smith, Parfrey and Co., Ltd., that promises to be kept busy throughout the cold weather is that for the repair of cracked water-jackets, cylinder-heads, water-connections, &c. By dint of considerable experiment during the summer they have discovered how to treat such damages in the minimum time, with the utmost efficacy, and at the lowest possible cost. They have also been kept busy lately converting the pillar change-speed levers of Rovers and Darracqs to change devices of the ordinary side-lever pattern. There have been yet further extensions at the Pimlico Wheel and Motor Works, and it is certain that London now contains the largest and best equipped repair establishment in the kingdom.

* Abstract of paper read to the members of the Royal A.C., on Thursday December 12th, 1907.

CLUBS AND ASSOCIATIONS.

MOTOR CLUB.

MR. R. E. EDMONDSON, the secretary of the Crystal Palace Club and polo manager, has been appointed secretary of the Motor Club.

THE AUTO-CYCLE UNION.

THE annual six-days' trial will next year again take the form of a reliability run from Land's End to John o' Groat's. Last year's trial was certainly one of the most successful of any promoted by the club, and it will be extremely interesting to see to what extent machines have now been improved, and what will be the proportion of starters who succeed in getting through from "end to end." The question of awards has not yet been considered by the committee, but we are informed that the rules and conditions will be out in good time.

LADIES.

AT the last meeting of the Committee of the Ladies' Automobile Club, the following were elected members of the club:—Mrs. William Bradshaw, Miss Vera Davison, the Hon. Mrs. Hanbury-Tracy, Mrs. Hartmann and Mrs. Jamieson.

The committee have arranged with Mr. R. S. Currie, the club engineer, for another course of his technical lessons to be given at the club. These will be given weekly, from January 29th to March 4th. They will be free to members, and each member may bring with her one friend, but for each friend a charge of 5s. per lesson will be made.

SOCIETY OF MOTOR MANUFACTURERS.

AT the meeting of the Council of the Society of Motor Manufacturers and Traders, held on the 12th inst., it was resolved to take the opinion of the trade with regard to the proposed Isle of Man race next year. Applications for the formation of local agents' sections were received from what was formerly known as the Midland Motor Traders' Association, of which Mr. W. J. Burton, Nottingham, was the secretary; from the Manchester Association, with Mr. C. E. Taylor as the secretary; and one from the county of York, received through Mr. H. J. Lloyd, of York city.

BEDFORDSHIRE.

THE first annual meeting of the Bedfordshire A.C. has been held at the Swan Hotel, Bedford, Mr. W. H. Allen (chairman of committee) presiding. The accounts showed a balance in hand of over £50. All the officials were re-elected with Lord Amphil still as president, and Mr. G. J. M. Whyley as hon. sec. A dinner followed, at which several ladies were present, and several complimentary toasts were observed.

SHEFFIELD.

ON Tuesday the second annual dinner of the Sheffield and District A.C. was held at the King's Head Hotel, Sheffield, about ninety gentlemen sitting down under the presidency of Mr. Harvey Foster. Amongst those present were Dr. G. H. Lodge (Mayor of Rotherham), Dr. Pearson, Superintendent Bielby, Messrs. H. J. Wells (Barnsley), J. H. Pickford (Rotherham), F. B. Cawood (hon. secretary), Ben Hind, E. F. Coupe, P. Richardson, W. Browne, H. C. Else, T. H. Firth, J. Barber, and others. The toast of "The Public Authorities" was given by Dr. Pearson, who made reference to the kindly relations which subsist between motorists and the police, and to the efforts which are being made to secure improvements in the roads. In replying, the Mayor of Rotherham expressed a firm belief that during the next few years great progress must be made. Mr. Fearnley, of the Sheffield Tramways Department, also responded, alluding to the coming of the Universal Lights on Vehicles Act at the opening of the year, and to the greater justice and safety which would thereby be secured by all users of our highways.

Mr. W. Robinson proposed "The Motor Union of Great Britain and Ireland," and Mr. Rees Jeffreys responded. He spoke very warmly of the services of Sheffield's representatives to the Union, enumerating Mr. Cawood, Mr. Firth and Mr. Barber. The Union had done what it could to weld together all the automobile clubs of the kingdom, the consequence being that that body has now become the Common Council of automobilism, and able to control the common politics of the industry. He thought that there was no fear of internal dissension or of a retrogressive step, and a small and unrepresentative body in the Metropolis being left as the authority. The future was a very difficult one, for there was the new Bill to be faced, and the likelihood of increased taxation was one of the chief subjects to be considered. He still thought that increase in taxation would not be objected to so long as the produce was paid into a central fund to be applied as grants in aid towards improvement in our main roads. The Motor Union was always watching the legislative battle, and no private Bill was introduced into the House of Commons without the most careful scrutiny by the Union, so that the rights of motorists should be safeguarded in every possible way.

Other toasts were "The Visitors," proposed by Mr. T. H. Firth, and responded to by Mr. H. J. Wells (of the Barnsley and District A.C.) and "The Sheffield and District Automobile Club," proposed by Mr. H. C. Else and responded to from the chair.

HARROGATE AND DISTRICT.

DR. OZANNE (president of the Harrogate and District A.C.) occupied the chair at the second annual dinner, held at the Prince of Wales Hotel, on Saturday. The President was supported by the Mayor (Alderman N. Williams, M.D.), Dr. A. F. Dimmock, Mr. G. C. Veale, Dr. Holroyd (hon. sec.), Mr. H. Gaskell (Blackburn), Mr. H. S. Birtwistle (hon. treasurer), Superintendent C. Keel, Mr. J. A. Titley (hon. solicitor), and others.

The Chairman gave the usual loyal toasts, which were duly honoured, and Mr. T. E. King proposed "The Motor Union," remarking that the Harrogate and District Club had been affiliated with the Motor Union for some time past, and they had every reason to be satisfied with their relationship. Mr. W. Rees Jeffreys, in response, referred to the assistance Mr. King, who was the representative of the Harrogate A.C., had been to the general committee with the views of the Harrogate Club upon important questions of policy from time to time decided by that committee. The Harrogate Club was very fortunate in its officers.

Mr. E. H. Hepper proposed "The Harrogate and District Automobile Club," and remarked that it was always a pleasure to come to the beautiful town of Harrogate. The beginnings of the Harrogate Club were likely to lead to greater things. Referring to the application some time ago, he did not think the Harrogate Club was well advised to go in for a ten mile limit in all the streets. Dealing with needed reforms, he alluded to the injustice of motorists being compelled to have a light in front and at the rear of their cars, whilst other vehicles were allowed to go along the roads without a rear light. With regard to the taxation of motor-cars, any tax that might be put on, and money received from licences of motor-cars, and all moneys derivable from that form of taxation should be placed to the upkeep of the roads. In course of conversation with Superintendent Keel, he gathered that he was not in favour of police traps on open roads. He quite agreed with the superintendent on the other side of the question, that dangerous driving through villages should be stopped.

Dr. Holroyd, in response, referring to the formation of the club, said that about the end of 1904 the Harrogate Corporation wished to impose a speed limit of eight miles an hour in the whole of the borough of Harrogate, which was ridiculous. A few motorists in the district met and decided to oppose the scheme. Shortly afterwards it was thought advisable to form a club, and eighteen motorists who, he was pleased to say, were still members, formed the Harrogate and District A.C. After a reference to the part taken in the recent speed limit inquiry by the club and the Corporation, he remarked that the result was extremely satisfactory to the club, because in the streets that were scheduled it would be absolutely dangerous to drive at times over ten miles an hour. They had now a membership of ninety, and they had taken their place in the country as one of the best working clubs.

Dr. Solly proposed the toast of "The Mayor and Corporation." The Mayor, in response, after a humorous reference or two, speaking on the speed limit, said that he agreed with Dr. Holroyd. He certainly thought on some country roads twenty miles an hour was rather slow, but along many roads and in villages and towns twenty miles an hour was much too fast. Had it not been for "road hogs" he was sure motorists would not have been worried or annoyed by the police traps. Mr. J. E. Titley gave the toast of "The President." It struck him that the Harrogate and District A.C. were particularly fortunate in their president, who had helped them from the very beginning. They could not have a better president. Dr. Ozanne was heart and soul in the welfare of the club. The toast was given with musical honours.

Dr. Ozanne, in response, thanked them for the hearty manner in which they had drunk his health. With regard to the office he held in the club, it gave him much interest and pleasure; he was in at its birth and had watched its progress. He expressed his strong disapproval of the disgraceful habit of going much beyond the speed limit in towns and villages, and considered the Act was very fair to motorists.

THE Bradford M.C.C. is nearing a membership of 100. Mr. G. E. Vint is the president.

THE Perak (Federated Malay States) Motor Union, formerly known as the Ipoh A.C., has affiliated to the Motor Union.

MR. J. R. BEDFORD, who founded the Birmingham Motor-Cycle Club five years ago and who has been the hon. secretary since then, has just resigned owing to his removal to Reading.

THE Motor Accessories Company, 58, Great Marlborough Street, W., are special selling agents for the G.L. controller, and agents for the G.L. carburettor.

THE West End Tyre and Accessories Company have opened a show room at 2B, Piccadilly Circus Mansions, 67A, Shaftesbury Avenue, W.C., where the "West End" non-skid and all kinds of tyres and accessories can be seen.

THE result of the Limerick competition of Messrs. W. Searle and Co., the speed indicator specialists, is as follows:—First, the line, "And most Searle-y they looked when home striding," sent by Mr. C. Rayner Booth, of Tudor House, Mickleton, Gloucestershire; and second, "From the 'copse' where they were abiding," sent by Mr. S. Batchelot, of Blackstock Road, Finsbury Park, N.

CARBURETTING AS DETERMINED BY EXHAUST GAS ANALYSIS.*

BY DUGALD CLERK.

WHEN IN an internal combustion engine, whether petrol or gas, there is a best mixture of inflammable material and air, which gives for that engine the highest power consistent with the highest thermal efficiency. The object of the carburettor is to supply the air charge drawn into the petrol engine with a sufficiency of petrol to produce this proportion of charge, notwithstanding all necessary variations in the volume of the total charge drawn into the engine. A perfect carburettor should produce this best charge throughout the whole range of speed of the petrol engines considered, and throughout the whole range of variation in volume of charge per stroke required by the engine for control under the different circumstances of running. It is not a difficult task to design a carburettor which will give a practically perfect charge for one particular speed of rotation, and for one particular charge volume drawn in per stroke. It is, however, a most difficult task to design a carburettor which will automatically meet the varying demands for charge by the engine, both as to speed and volume fed per stroke. The jet carburettor, as originally designed by Maybach, assumed, and assumed correctly, that for certain variations of speed and charge volume the jet would respond to pressure changes in the inlet pipe to such an extent as to proportion the charge correctly within these limits. The wide range of speed and charge volume required to meet the conditions of a modern petrol motor, when actuating a car, necessitates, however, changes in conditions other than those obtainable by means of a petrol jet and a supply port or passage of

The author assisted at these experiments, and has also since made some experiments on his own car, an 18-h.p. Siddeley landaulet, having a four-cylinder engine, cylinders 4 in., stroke 4 in. The best results—parity of exhaust and maximum thermal efficiency—are obtained in adjusting the carburettor so that the engine gives the most economical petrol consumption for a given power. This power is somewhat under the maximum power possible, but not greatly under it. The conditions of innocuous exhaust and maximum efficiency are to be found together. The most important point apparent from these analyses is this: that complete combustion by no means follows because of excess of oxygen. That is, we may adjust a carburettor in such a way as to give a substantial excess of oxygen throughout its whole range and yet we may not succeed in suppressing carbonic oxide or completing combustion.

THE SKIDDING OF MOTOR-BUSES.

THE question as to whether a bus company or a borough authority were liable through a motor-omnibus skidding on a greasy, watered road, has been discussed at Shoreditch before his Honour Judge Smyly, K.C., and a jury.

The plaintiff was Lewis Archer, a labourer, who claimed £40 damages from the London General Omnibus Company (Limited). Plaintiff's case was that on July 3rd he was walking along Oxford Street, one foot from the kerb, when a motor-omnibus skidded, swept round sideways on the kerb, picked him up, and carried him about eight yards, and as it righted itself dropped him into the roadway. He had been unable to work for twelve weeks owing to a strained back, losing £2 a week. For the defence evidence was submitted to show that the road-

The Parade of Industrial Motor Vehicles on the Thames Embankment. (See page 952.)

uniform area. Accordingly, many methods have been proposed, and are in use, purporting to so vary the suction pressure within the pipe as to cause the jet to respond in the manner desired. All these automatic devices act by varying the pressure due to suction, either by operating a throttle valve or by opening an auxiliary valve. A usual method of determining the degree of success of the regulating device is to watch the flame coming from the exhaust valve under the various changes of condition intended to be made, and the attempt is made to ensure combustion as complete as possible and to proportion the petrol by seeing that the flame leaving the exhaust valve is not a luminous one, but a blue, non-luminous flame. This blue, non-luminous flame is supposed to indicate fairly complete combustion within the cylinder. This method of testing, however, is very crude, and gives but little real knowledge of what the carburettor is doing throughout the whole range, as to supply of the perfect mixture of inflammable vapour and air which is desired. On March 19th and 20th of this year a valuable investigation was made by the Royal Automobile Club on the nature of the gases and vapours emitted by twelve motor-cars under some of the conditions of ordinary running. It was shown that carbonic oxide gas was present in the exhaust from all the cars, and that while four cars discharged an exhaust containing under 2 per cent. of the gas, eight cars discharged more than this quantity. That is, the experiment proved that in all these cars the combustion within the cylinder was to some extent incomplete. In each case tested the gases were discharged into a copper drum by means of a flexible metallic tube coupled to the exhaust pipe at a point between the engine and the silencer. The copper drums were each of about 800 cubic inches capacity, and the portions of exhaust gases supplied were discharged during ten minutes, so as to ensure that the contents of the drum to be examined were average samples of the gases passing in that time from the engine. Two samples of exhaust gases were taken from each car.

*From a paper read before the Institute of Automobile Engineers on December 11th, 1907.

way had been only partially watered by the Borough Council that morning, causing it to be very greasy and the bus to skid, which would not have been the case had the road been well finished. Mr. Charles said that the borough authorities were liable for these skidding accidents. All the bus company were asked to do and paid their licence to do was to put a well-conducted vehicle on the road, which they did. It was the badly-watered thoroughfares which caused the mischief, and the borough councils were liable under those circumstances. The time had come when the burden of the liability should be put on to the proper shoulders. The company's buses were as safe as they could be made, and would not skid except for badly-watered roads. Judge Smyly said the bus companies had two duties with reference to motor-buses, to provide a competent and skilful driver and a vehicle reasonably fit to run about the streets. If the contention of the learned counsel was to hold good, it left it open that whenever there was a slight splash of rain a bus company with a skidding motor could sweep a person, quietly walking on the pavement, into the roadway. That was a very serious thing to contend. The jury found for the plaintiff for £40 damages and costs, and judgment was entered accordingly.

MESSRS. BROWN BROS. have published a souvenir giving particulars of the "Brown" cars used by the Royal Commission on Congestion in Ireland. When it is remembered that the "Brown" cars did over 21,000 miles on some of the worst roads in Ireland without an involuntary stop for mechanical troubles of any kind, their reliability seems fully assured.

MESSRS. LEO RIPAULT AND Co., 64A, Poland Street, London, W., send a copy of a new catalogue giving particulars of the K.D. motor-bicycle for 1908, the Oleo lubricating oils, a mouth siren fitted with a leather band for the wrist, and the Oleo plugs in porcelain, mica and steatite, as well as igniters, terminals, voltmeters, &c. The firm find that these specialities are coming well into favour with motorists.

COMPANY NEWS.

SINGER AND CO., LTD.—The annual meeting of this company was held at Coventry on Monday. Mr. G. Singer presided, and in moving the adoption of the report, a summary of which has already appeared in our columns—said that as to the obsolete stock, the directors considered it wiser to face the matter, and having now cleared the air by the amount written off, he believed the company would be able to show its own profits without further drawbacks, and that the motor company, which belonged to this company, would contribute largely. Mr. A. E. Jagger seconded. The report was adopted and a proposal for an Advisory Committee was defeated by one vote.

GENERAL MOTOR-CAB COMPANY, LTD.—The first annual general meeting of this company was held on Monday, Mr. Davison Dalziel presiding. The chairman, in moving the adoption of the report and accounts, said the period under review was one of preliminary organization entirely. Although on May 13th last there were only eighty-six cabs in work, the company finished the period of the six months on November 13th with no less than 467, and the average number of cabs working per day was 306. The average takings per cab per day during the whole of that period were £2 3s. 6d., thus exceeding the estimate set out in the original prospectus by 8s. 6d. per day. Five hundred cabs have been delivered, and the company were now beginning to receive deliveries of the second order of 500 Renault cabs, which, together with the other vehicles ordered, would all, no doubt, soon be running and earning revenue. The balance-sheet for the six months from May 13th to November 13th showed a net profit, with an average of only 306 cabs at work per day, of £41,887. Those profits were arrived at after every possible proper charge had been debited against the accounts, and the directors decided to declare an interim dividend at the rate of 7 per cent. per annum on the Preferred Ordinary shares for the six months ending November 13th. After writing off the debit amount of last year, amounting to £9,682, and the amount necessary for the payment of the interim dividend, there remained about £20,000, which would allow of the payment of the very substantial additional bonus to the preferred shares and a very substantial dividend to the deferred shareholders. The directors had considered it wiser, however, to defer these distributions until the end of the year, when they would no doubt be able to do even better in the way of distribution to all classes of shareholders. The report was adopted unanimously.

DUNLOP TYRES.—The annual meeting of the shareholders of the Dunlop Pneumatic Tyre Company was held on Monday, Mr. Harvey Du Cros, M.P., presiding. In moving the adoption of the report, the chairman said in 1905 the patents under which the company was originally formed expired, and the company became merely a trading concern. In that year their earnings were £114,878, in 1906 they were £165,786, and in 1907 their earnings, under competitive conditions, were £200,478. In the last twelve months they had paid out in dividends and to the debenture holders the sum of £252,323. The meaning of that was that the company had distributed as nearly as possible £20,000 each month. The present year showed an increase of £25,000, and, of course, that was followed by an improved distribution, and the whole of that improvement went naturally to the deferred shareholders, who now received 10 per cent. They had developed an invention in relation to detachable rims, and they would embark in the business of the manufacture of motor rims, the same as they had done in the flatter of rims for cycles. Mr. C. W. Healy seconded the adoption of the report, which was agreed to.

CAR AND GENERAL INSURANCE CORPORATION, LTD.—The fourth annual and general meeting of the Car and General Insurance Corporation (Limited), was held on Monday. Mr. E. Manville presided, and, in moving the adoption of the report, said the net result of the year's operations was, inclusive of the premiums on the issue of the new shares, a disposable balance of £16,273. The premium income during the first year amounted to £26,828; the second year it amounted to £64,475; in the third year, during which the results were based on ten months' working, calculated pro rata for twelve months, to £98,948; in the fourth year, just finished, to £171,336. During the four years of their existence they had received as net premiums a total of £345,099, and during the same period they had paid as claims a total of £201,155, or an amount equal to 58.3 per cent., which must be considered entirely satisfactory. With regard to expenses, these in 1904 amounted to 51.4 per cent.; in 1905, to 40.4 per cent.; in 1906, to 41 per cent.; and in 1907 to 39.8 per cent. It was, however, extremely likely that competition might force them to open a department to undertake a non-tariff fire insurance. The directors proposed to dispose of the balance of £16,273 by adding to the reserve fund the sum of £3,500, writing off the special agency charge the sum of £9,000, to declare a dividend of 5 per cent. per annum, together with a bonus of 3d. per share, free of income-tax, amounting to £2,180, and to carry forward £1,592. Mr. J. Gorham seconded the motion, which was carried unanimously.

FIAT MOTORS, LTD.—The annual meeting of this company is being held to-day (Saturday), when the directors will submit accounts showing a net profit of £8,041, from which a further dividend at the rate of 5 per cent. will be paid, bringing the total dividend of the year to 10 per cent. Since September 30th stocks have been reduced by sales by some £40,000, and the company have now on hand orders amounting to over £130,000. The company has acquired a large interest in the deferred shares of the F.I.A.T. Cab Company, and anticipate good results from the opening of the new works at Wembley.

THE DARRACQ-SERPOLLET OMNIBUS COMPANY, LTD.—At the first annual general meeting of this company, to be held on Monday next, the directors will report on the period from the May, 1906, to the end of September, 1907, when there was a debit on the profit and loss account of £7,294. Mention is made of the lamented death of M. Leon Serpollet, and the equipment of the new factory under the direction of M. A. Darracq.

NEW COMPANIES REGISTERED.

LANCASHIRE STEAM MOTOR COMPANY.—£100. As title. North-cote Street, Leyland.

PITTLER UNIVERSAL ROTARY MACHINE SYNDICATE.—£50,000. To acquire an option or group of options for dealing with the Pittler Universal Rotary Machines patents throughout the British Empire. The directors are Messrs. T. Parker, jun., Chaddlesley, Beechwood Avenue, Kew; C. Lorenzen, Roselea, Spencer Road, Wealdstone; A. H. Lang, 36, Whellock Road, Bedford Park, Chiswick; and T. M. Davies, Queen Anne's Mansions, St. James's Park, S.W. 80-81, High Holborn, W.C.

VALWIN TYRE AND RIM COMPANY.—£1,000. Agreement with Mr. H. W. Gladwin for acquisition of certain secrets, patents, rights and property in London.

PRIZES FOR DRIVERS.

ON Saturday, under the auspices of the Commercial Vehicle Users' Association, a parade of drivers of motor vehicles engaged in industrial service was held outside the offices of the Thames Conservancy on the Embankment, London, when prizes were awarded to drivers who had travelled a distance of not less than 4,800 miles on their vehicles during the past twelve months, or longer period. Each of the drivers underwent a verbal examination as to his knowledge and experience of his machine, and his skill in driving under traffic conditions. After a careful examination of the twenty-six steam motor-wagons and tractors, the prizes were awarded as under:—

£5 EACH EQUAL FIRST.

Patrick Driscoll (Thornycroft), employer the Westminster City Council, 63,000 miles.

Fred Gunn (Foden), employers Seabrooke and Sons, Ltd., 24,300 miles.

£2 EACH EQUAL SECOND.

John Troughon (Straker), employer Franch Asphalte Co., Ltd., 28,200 miles.

Albert Smith (Foden), employer Chislehurst Mineral Waters Co., 26,000 miles.

£1 EACH EQUAL THIRD.

William Winn (Thornycroft), Allen and Hanburys, Ltd., 39,200 miles.

A. Brown (Coulthard), Baker Bros., 18,400 miles.

J. Ward (Thornycroft), Mark Mayhew, Ltd., 42,900 miles.

D. Woodhams (Foden), Mark Mayhew, Ltd., 46,500 miles.

M. Geraghty (Lancashire), Mark Mayhew, Ltd., 30,600 miles.

C. Hills (Straker), J. and M. Patrick, 22,000 miles.

THE DISCHARGE OF PETROL INTO SEWERS.

AT the Thames (London) Police Court, Robert Watson, giving an address at Arddarrock, Garelochhead, Dumbartonshire, was summoned on the 12th inst. for allowing a quantity of petrol to run from a light locomotive into a gully leading to a sewer. Mr. Carter prosecuted for the London County Council, and Mr. J. Harris defended. Joseph Townsend stated on July 16, between eleven and twelve o'clock in the day, he saw a motor-car outside the Clyde Shipping Company in Nightingale Lane, and the chauffeur was letting his petrol down a sewer. John Hunter said that he saw the defendant turn the tap and let the petrol out. The witness said to the defendant, "If a policeman sees you doing that you will get summoned." The defendant replied that he wanted to get away. Mr. Carter said that damage had been done to the extent of £35, and had men been working in the sewer with lights, serious consequences would have followed. Counsel for the defence said that the defendant took a motor-car from Seymour Place to the Clyde Shipping Company, and was informed by an inspector of the police that the car could not be allowed into the dock before the petrol was got rid of. The inspector told defendant that he could let the petrol go down the gully, and he did so in the presence of the inspector and a constable. The defendant went into the box, and bore out his counsel's statement. The Magistrate: Have you brought the inspector here? It is a very serious aspersion on the police. Counsel: We did not think it was necessary. The defendant's employer has paid £35, the cost of the damage. Mr. Dickinson fined the defendant £5 and £2 2s. costs.

MESSRS. JARROTT AND LETTS, LTD., announce that their offices will be closed from Christmas Eve until the morning of Monday, December 30th.

CASE UNDER THE MOTOR CAR ACT.

A DISMISSAL.

At the Beaconsfield (Bucks) Sessions, on Tuesday, Thomas Barry, driver to Sir John Dickson-Poynder, M.P., was proceeded against for driving a motor-car in a negligent manner on the highway at Taplow, on November 26th. Frederick Martin, of Slough, said that on November 26th, as he was returning from Maidenhead, he saw a motor-car approaching from behind. At the time witness was on the left side of the road, going towards Slough. He took the lamp (produced) out of the socket, and waved it at the back of his pony chaise. A moment later he was "smashed up," the motor-car striking him from behind, the vehicle being doubled up like a saucer. His wife was thrown to the road, and the pony galloped back to Maidenhead. The chauffeur told him that he was on the wrong side of the road, and witness replied that that was impossible, and had he been looking he must have seen his vehicle. In cross-examination he said he had asked Sir John Dickson-Poynder for £10, but had he thought it was his (witness's) fault he should not have asked for a penny. He would have been content with the result of any civil action, but the police, unknown to him, took the present proceedings. When he received a letter from Sir John he also got £5 paid to him without prejudice. In all, he had received £6. Mr. Eames submitted that it was not a case for a criminal prosecution, and that there was no evidence to show that defendant was driving negligently. Defendant gave evidence to the effect that when fifty yards off the chaise his lights showed up the vehicle, but when within about eight yards he saw a light waving about, and he then thought it was a cyclist talking to the driver. He made preparations to pass the vehicle, but failed to do so, and struck the hind wheel of the chaise. After consultation in private the chairman said the magistrates would dismiss the case.

MOTOR SCOUT AND POLICE "TRAP."

A CASE, which may be carried to the High Courts, was heard by the Kingston-on-Thames County Justices on the 12th inst. Edward Collyer, a cyclist patrol in the employ of the Automobile Association, living at Addlestone, was summoned for having wilfully obstructed police officers of the Surrey Constabulary, whilst in the execution of their duty, at Walton, on November 10th. Defendant was further summoned for aiding and abetting the driver of a motor-car, whose name was unknown, to exceed the twenty miles an hour speed limit at the same time and place. Mr. A. H. Bodkin, who appeared to prosecute, said defendant was a patrol in the employ of the Automobile Association. He found the measured furlong of the police, and interfered with the policemen on duty by dogging their footsteps and by standing in such a position that, having a thoroughly good view of the approaching cars, he was able to give the drivers a signal to enable them to escape from the consequences of travelling at an excessive speed. Police evidence having been given in support of counsel, Earl Russell, for the defence, submitted that there was no proof of obstruction by the defendant. All that he did was to give a signal to an approaching car causing it to obey the law. If they had chosen officers could have proceeded against the drivers of the cars, but unfortunately the police did not see their way to stop the cars. To say that defendant went to the road to stop the car and prevent the police from obtaining a conviction was a very different thing to obstructing the police in the execution of their duty. Scouts were really peripatetic notice-boards to warn motorists of dangerous driving. The Bench found that the speed limit had been exceeded, and that defendant had been guilty of obstructing the police in the execution of their duty. Defendant was fined £2, with £55s. costs, and the second summons, which was not gone into, was withdrawn by the prosecution. Notice of appeal to the High Courts was given.

ALLEGED THEFT OF A MOTOR-CAR.

At Coventry, Percy Goddard, alias William Thompson, has been committed for trial charged with obtaining a motor-car by false pretences. He was said to have deserted from the Border Regiment, and entered the service of Mr. George Walker, J.P., as chauffeur. He was sent to the Daimler works with a car for repairs, and forwarded a telegram purporting to come from his employer, negotiating for a car worth £750, his employer having been in negotiation for a new car. Goddard selected one worth £678, and went to Nottingham with a young woman, leaving the car at a hotel there. He borrowed six shillings from the landlord and rejoined his regiment, and was sent to York military prison for desertion, and arrested there on the present charge.

It is announced that the manufacturers of the Delannay-Belleville cars obtained at the recent exhibition of motor-cars in Paris the only gold medal, constituting the highest award of the show for elegance in cars.

THE latest catalogue to hand is an advance copy of that of the Swift Motor Company, Ltd., of Coventry. The text and illustrations of this production make evident the fact that the 1908 Swift cars would have great claims on buyers' attention even had they not Swift reputation in their favour. Some of the coachwork of the new models is particularly noteworthy. Of the various chassis from 10-12-h.p. to 25-30-h.p., it need merely be said that they worthily maintain the company's reputation.

ROAD REPORTS.

CAMBERWELL.—During the past summer the engineer's department of the Camberwell Borough Council had some of the principal thoroughfares tar-sprayed with a view to coping with the dust nuisance. The experiments having proved very satisfactory, the Works and Purposes Committee have decided that it will be advisable next year to treat an increased number of the roads with this preparation. Towards that end a sum not exceeding £200 is to be provided in the estimates.

DURING the next few weeks Mr. J. A. Heap, the Todmorden Borough Engineer and Surveyor, will be carrying out repairs to the Burnley road between Todmorden and Portsmouth, which he hopes will give little or no inconvenience to the motor traffic along the road, for which consideration motorists will be appreciative.

LINLITHGOW.—The Town Council of Linlithgow is seeking to secure a speed limit of ten m.p.h. for motor-cars.

BASINGSTOKE.—The main road to Winchester about a mile out of the town has been repaired with granite during the past week. This will complete the repairs on this road. During the next fortnight the main Salisbury road will be similarly repaired. The steam roller is in immediate attendance, so that Mr. F. R. Phipps, the borough surveyor, anticipates that no inconvenience to motor-cars will arise. This completes the work on main roads this season.

NEWHAVEN.—The Newhaven Rural Council intends to lower the gradient of the two "mounds" on the Newhaven-Seaford road near the railway bridge. In the meantime a notice-board warning motorists and others to drive slowly is to be erected on the Seaford side.

CARNARVONSHIRE.—Before the Royal Commission on Coast Erosion, Mr. J. E. Greaves has said that at Avonwen during the last hundred years 36 acres of land had been washed away by the sea, and erosion was still going on there and in other parts of the county. At Penmaenmawr

The Argyll 16-20-h.p. two-ton delivery van recently completed for Messrs. John Angus and Son, of the Vale of Leven Bread Factory, Alexandria, N.B.

The vehicle is interesting, as the Argyll Company only supplied the chassis, the body being an adapted one, having been previously used as a horse-drawn van.

the cliff was being eroded by land-water, atmospheric influences, and the sea. The main road, which ran close to this place, had already been moved twice, and it was now considered in danger of collapsing.

BELFAST.—The Belfast City Council have applied to the L. G. B. for a ten mile limit for motor-cars in the borough. Objection has been lodged by the Motor-Cycle Union of Ireland (Ulster branch).

MOTOR-BUS v. CAB.

JUDGE RENTOUL, K.C., has been engaged a considerable time at the Central Criminal Court investigating a charge against Richard Sansom, aged thirty-four, a driver of a "Vanguard" motor-omnibus, who was indicted for causing grievous bodily harm to John Dove, of Kensal Rise. Dove was proceeding slowly up Park Lane at night with a four-wheeled cab towards the Marble Arch when he was overtaken by a motor-omnibus driven by Sansom. This struck the box of the back wheel of the cab and smashed it to pieces, threw the driver Dove into the middle of the roadway, where he was picked up seriously injured, mounted the pavement, and knocked down twelve feet of the Hyde Park railings. The horse had two legs broken and had to be destroyed. The jury found the driver guilty of wanton driving. Sansom was bound over in the sum of £10 to come up for judgment if called upon.

AMONGST recent purchasers of the 40-h.p. Weigel chassis are Mr. Norris Hepworth, of Leeds; Mr. Fred Horne, of the well-known firm of Horne Bros.; and Mr. Geo. Monro.

FORTHCOMING EVENTS.

DECEMBER.

21st (S.).—Opening of the Brussels Exhibition.

JANUARY, 1908.

1st (W.).—The Lights on Vehicles Act comes into operation in England, Wales, and Ireland.

New Public Health Act comes into operation.

4th-11th.—Dublin Motor Show.

8th (W.).—Incorporated Institution of Automobile Engineers—Dr. H. S. Hele-Shaw on the Fuel Question.

Special meeting of the Royal A.C.

9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.

11th (S.).—Annual meeting of the Lincolnshire M.C.C.

17th (F.).—Annual Dinner of the Nottinghamshire A.C. at the Victoria Station Hotel, Nottingham.

18th-Feb. 2nd.—Automobile Exhibition at Turin.

24th (F.).—Annual Dinner of the Scottish A.C. at Edinburgh.

25th (S.)-Feb. 1st.—Scottish Motor Exhibition in the Waverley Market, Edinburgh.

26th (Sun.).—Criterium de Voitures and Coupe de l'Exposition Trial for motor-cycles organised by the Turin A.C. and the Motor Club of Italy.

29th (W.).—First lesson of the course to be given by Mr. R. S. Currie to the Ladies' A.C.

31st (F.).—Annual meeting of the Blackheath A.C.

FEBRUARY.

1st (Sat.).—Annual meeting of the Lincolnshire A.C.

2nd (Sun.).—Reliability Trial of the Motor Union of Western India.

7th-15th.—Manchester Motor Show at Belle Vue.

12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.

15th (Sat.).—Auto-Cycle Union Annual Dinner.

20th (Th.).—Meeting of the Essex M.C.

Mr. H. R. de Salis on the Inland Waterways of England and Wales from the motor-boating point of view.

24th (M.).—Motor Show at Bcmhay.

MARCH.

21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

APRIL.

Auto-Cycle Union's Tourist Trophy Race and Quarterly Trial.

25th-May 25th.—Industrial Vehicle Competition of the A.C. de France.

MAY.

10th (Sun.).—Targo Florio.

JUNE.

Royal A.C. Reliability Trial for Touring Cars.

15th-19th.—Scottish Reliability Trial.

AUTOMOBILE ACCIDENTS.

Two serious motor-car accidents occurred in Manchester on Sunday. A woman was knocked down and removed to the Royal Infirmary, and in another case a car which collided with an electric pole was considerably damaged, and one of the occupants was conveyed to the infirmary in an unconscious state.

A VERDICT of culpable negligence has been returned at Surbiton at the inquest on Mr. Thomas Cooper, of Kingston. On Sunday week Mr. Cooper and his sister were driving in a governess cart at Long Arch, Thames Ditton, when Mr. David Bentley, engineer, Kingston, who was driving his own motor-car, ran into the governess cart from behind. The governess cart was capsized and Mr. Cooper was thrown out. He was removed to the Surbiton Hospital, where he died the same night from his injuries. The evidence was of a somewhat contradictory character. The coroner said the jury's verdict amounted to one of manslaughter, and he committed Bentley for trial, accepting bail.

CLAIM AGAINST MOTORIST.

In the Greenwich County Court, William Page, managing clerk to a city firm of solicitors, sued the Associated Newspapers Company, Ltd., for £24 for personal injuries to his six-year-old boy, who was knocked down and seriously injured by the defendants' motor-car owing, it was alleged, to reckless and rapid driving of the chauffeur. The judge, in addressing the jury, pointed out that foot-passengers were as much entitled to use the roads as vehicles, and it was for motor-car drivers to exercise special care and to remember that there were children on the footpaths who were likely to run in the road. The jury awarded plaintiff £20 and costs.

POLICE TRAPS.

A TRAP has been established at Great Gonarby on the Great North Road; another is also in frequent operation at Alconbury, on the same highway.

MAIDSTONE Road, North Cray, has a measured furlong leading to the Bromley Petty Sessions.

THE Lewisham High Road police trap will probably be working during Christmas.

SEVERAL traps have lately been notified in the neighbourhood of Wimbledon Common.

THE Portsmouth road trap is again leading many motorists before the Kingston Bench.

BUSINESS NEWS.

THE UNITED MOTOR INDUSTRIES, LTD., will close their offices and stores from the evening of the 24th until the morning of 30th inst.

BASELEY'S BRITISH OIL COMPANY, 37, Walbrook, London, E.C., is supplying motor oils for agents who wish them labelled with their own name, with an effective certificate showing they are used by leading motor-car firms.

MESSRS. PERRY, THORNTON AND SCHREIBER, LTD., Long Acre, London, W.C., inform us that their showrooms, workshops and offices, dealing with the Ford Car department, will be closed from Tuesday, the 24th inst., until Monday, the 30th inst.

THE 60-h.p. six-cylinder Thames car on which Mr. Clifford Earp made world's records at Brooklands, as recorded in last week's *M.C.J.* was fitted with the magneto of Messrs. J. C. Fuller and Son, of Old Ford, E.

MESSRS. S. F. EDGE (1907) LTD., are closing their establishment from Christmas Eve until Monday, the 30th inst. Telegrams, however, received before 11 a.m. on the mornings of Friday and Saturday will be dealt with.

MESSRS. ALFRED HERBERT, LTD., of Coventry, send a calendar for 1908, which will not only serve as a daily reminder of the progress of time, but also as a pictorial illustration of the variety of machine tools made by that firm.

MR. J. C. EATON, of Toronto, known as the Whiteley of Canada, has placed an order for an 80-h.p. six-cylinder Napier, while Mr. H. D. Reid, of St. John's, Newfoundland, has ordered a 60-h.p. six-cylinder Napier from Messrs. S. F. Edge, Ltd.

THE MERCEDES-MITTE COMPANY, LTD., of 12A, Saville Row, W., have now purchased the business of the Cannstatt Automobile Supply Association, and are fully installed in their new commodious premises at 11A, Regent Street, Waterloo Place, S.W.

THE PREMIER MOTOR COMPANY, LTD., of Aston Road, Birmingham, have secured from Messrs. Clement-Talbot, Ltd., the sole agency for the sale of Talbot cars in Birmingham, the district covering a radius of twelve miles from the centre of that city, as also the whole of the county of Warwickshire.

MR. U. STRATTON, the London manager of the Daimler Company, has been presented by the German Emperor with a scarf pin, representing the crown and the initial set in diamonds, as a token of his Majesty's appreciation of the pleasure he obtained from the Daimler cars placed at his disposal during his visit to this country. Mr. Stratton also received a signed photograph from H.M. the King of Spain, in which he conveys his appreciation of the Daimler cars used by him and his Consort during their visit to England.

THE German Emperor has placed an order with Messrs. S. Smith and Son, Ltd., for one of their Perfect speed indicators. This is the same type of instrument as was fitted to the Daimler car used by His Majesty during his visit to this country, and is of the Duplex type. By means of this instrument His Majesty was able to see, in the interior of the carriage, the exact speed at which he was travelling. He was also able to communicate with his driver, by means of the electric communicator, any directions he might wish to give.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-28, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notices will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, DECEMBER 28, 1907.

[No. 460.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

WITH the close of the year the various organisations concerned with motoring are setting forth their policies for the future, and in the multiplicity of official circulars which we have received with the customary Christmas greetings there may be excuse for confusion. Recently the frontiers of the A.A. and the M.U. were mutually determined, and it

was agreed that each should have its own sphere of influence and work. Then came the divorce of the R.A.C. and the M.U., with consequent statements of views and polite controversial documents. Again we have the definition of the special work of each, from which it is seen that the Club will continue its engineering side, develop a legal department and endeavour to keep in touch with provincial automobilism by a reduction of the capitation fee. Probably a new badge specially designed for those who are not fully fledged members of the R.A.C. will be offered for the decoration of the car, so that members of all the different organisations will be able to fully embellish their dashboard with many badges "all in a row." With regard to the M.U. a long statement has been issued setting forth its genesis into motorland and its exodus from Piccadilly. With regard to the future it, like the R.A.C., will have a Touring Department and an official organ, as well as give expert advice respecting the purchase and repair of cars. The work of influencing public opinion will be continued, the efforts "to increase the amenities of the highway" will not languish, and an appeal is made to motorists to see that "the organisation which directly represents their interests and their wants and which they themselves control is not maimed or weakened." Meanwhile the majority of the provincial organisations have adopted the policy of "masterly inactivity" until the New Year, when they will doubtless consider the respective programmes of the great central bodies and settle on which side they will stand.

The Spirit of the Age.

At this reason of the year many of the various literary and debating societies throughout the country are giving a little attention to automobilism, some of their members reading papers and delivering addresses on the subject. In this way much information of an accurate as well as a fanciful character is being imparted, and if the evening provided by the Rev. Canon Lambert at the meeting of the Hull Literary Club recently is a criterion these gatherings are distinctly enjoyable. The reverend gentleman began by describing the motor-car as the flower and apotheosis of ten thousand years of human progress in its design and workmanship, embodying a beautiful achievement of science and mechanism. In fact, nothing more approaching a living and sentient being had yet been achieved by human hands. He went a step further, and suggested that a car, with engine and adjuncts, was not a machine but a living thing—a living organism, lacking only a soul and conscience. The "unreasonable prejudices" of people who do not drive motors were treated with delicious satire, and the police were not forgotten. Personally he had not had much experience of them, but he doubted whether it was conducive to good citizen-

ship to brand as common criminals men whose sole fault was that they had attained too great a degree of civilisation. Some people viewed with alarm the threatened displacement of horse traffic. He did not entirely share their view. The horse was a noble animal, and although it was true that about 12,000 aged specimens were annually shipped from the Humber to Belgium to be converted into sausages, there would always be a reason for the preservation of the species, if but for the cultivation of the new serum for the cure of diphtheria. Dr. Lambert gave a glowing account of a motor trip from Hull to Cardigan Bay—a day's trip of 220 miles—describing the fascination of the steering wheel.

The Australian Outlook.

IN the Australian colonies a fair, as distinct from a best, harvest is anticipated, and indications do not favour a repetition of the marvellous returns enjoyed by the agricultural community there during the past five years. So far as South Australia is concerned most of the rich men have become motorists and the demand for expensive motor-cars has been supplied. There is, however, a need for less costly vehicles of small horse-power for short distance work, and our Adelaide correspondent suggests that only in that direction can good business be done for a season or two.

R.I.T.A.

THE quartette of letters has no reference to the popular novelist but is the Australian abbreviation of the title of the Roads Improvement and Touring Association, which has done much to arouse the authorities to recognising their duty in regard to the roads of the colony. The association has a pathway for cyclists on the Frankston road in Victoria and is working to have the question of main road maintenance put on a State basis. During the past year the motor-car has made great strides in the colony of Victoria, and at the Melbourne Cup Meeting at the at the beginning of November there were 200 cars in the carriage paddock, which is said by our correspondent to have been an "eye opener" to many people. The demand for garage accommodation in the city of Melbourne has been rapidly increasing, and it requires only an improvement of the roadways to cause great development in that direction. The Sealed Bonnet Reliability Trials under the auspices of the Automobile Club of Victoria took place on the 5th, 6th, and 7th inst. The runs on the three days were respectively of 151, 141, and 102 miles, and in its incidental features the event was managed on the lines familiar enough to those in the Old Country.

Improving the Brighton Road.

AN interesting combination of private zeal and public spirit is afforded by some correspondence which has passed between the Roads Improvement Association and the Borough Surveyor of Reigate with regard to the proposed improvement on the last ridge of the hill at the bottom of Earlswood Common, on the road between Horley and Redhill. The hill is situated between the twenty-first and twenty-second milestone from Westminster Bridge, and from the point of view of the large car owners there is not, perhaps, much in it except that the ridge intercepts the

view of the road; but from the small power point of view it means a change of speed. A definite proposal has now been made to practically remove the hill and remake the road at a cost of £1,000. Towards this Mr. A. Lloyd, of Croydon, will contribute £200 and the Roads Improvement Association is endeavouring to make this sum up to £350. When this is done the Borough Surveyor will recommend the Council to provide the other amount up to the extent of £1,000. Thus motorists have an opportunity not only to help themselves by securing the improvement of a much used main road but also to generally assist the motor movement by proving the practical sympathy of those who own cars with all who use the roads.

The Advertising Motor Van.

ALTHOUGH tradesmen no longer adopt the motor-van merely in order to find a novel means of keeping themselves before the public, one of the leading railway companies is at present utilising a motor-bus to acquaint the inhabitants of one end of this island of the delightful region at the other extremity. There is certainly a wise method in the new motor campaign of the Great Western Railway Company, which is informing the people in the cold Highlands of Scotland of the less biting winds of the Cornish Riviera. Some days ago the 30-h.p. Milnes Daimler 'bus shown in the accompanying illustration left Slough for the north. It arrived at Carlisle, and from thence travelled

round Scotland, passing through Dumfries, Ayr, Paisley, Glasgow, Crieff, Inverness, Elgin, Banff, Aberdeen, Dundee, St. Andrews, Stirling, and Edinburgh, and covering a distance of 2,500 miles. It had previously run 5,400 miles in public service at Paignton. In this way the attractions of Cornwall and South Devon as a winter resort have been brought before the people, and although Sir Dyce Duckworth may deplore the quicker movements associated with what he terms the "Motorial Age," the enterprise of the G.W.R. is to be commended. Truly the railway managers are recognising that the automobile is not necessarily an enemy.

"There's nothing like Leather."

THE old adage is proving its truthfulness with regard to the automobile industry, and although some saddlers and harness makers have attributed their appearance in the Bankruptcy Court to the advent of the motor-car upon the road, the day is yet far distant when the leather trade will cry "Ichabod." Our contemporary, the "Leather Trade Review," was at the recent motor show and noticed that "practically all the best cars were upholstered with leather, some of the enamelled material being exceedingly well got up and presenting a beautiful appearance. As one leather exhibitor said to us recently, 'There is, after all, a something about a leather upholstery which looks good, and which is not approached by any imitation, however close it may be.' This is so we honestly believe, and the inventor, who is always going to make millions from a leather substitute, has yet a hard task in front of him. In connection with this upholstery business, we think it is one which deserves a greater attention from British manufacturers. Nearly all the best makes of tyre protectors seemed to be in some form of the leather and metal studded band, although one

inventor had gone off the beaten track by inserting the studs in a narrow band of some specially hard leather, which looked very much like a sort of 'raw hide.' As usual, much of the chrome leather appeared to be of Continental origin, although here and there were certain makes in which the domestic article seemed to be favoured. Turning to the other leather articles used in connection with motoring, there was little change compared with last year; the all-leather clothing has become the recognised uniform of the professional chauffeur, although a good many sheep-skins must be also used for the leather linings of the aristocratic owner's coat. Gloves, leggings, caps, and car fittings, in the way of travelling bags, &c., also go a long way toward recompensing the maker of leather for the loss he has sustained in the way of harness. Altogether, we think the industry is to be congratulated on the fact that the all-conquering car has had to admit the fact that for many purposes there is still nothing like leather."

Road Reports.

AMONG the minor features of regular interest in our columns, the provision of road reports is of general utility and convenience. This also includes the applications for speed limits, the main roads where repairs are likely to be made, and similar matters, the knowledge of which is desired among motorists. We also now propose to add to the news contained in that department of editorial activity the doings of local authorities with regard to dealing with awkward corners, overhanging trees, high hedges, and the like. In recording these necessary adjuncts to public safety, the assistance of readers in distant parts of the country is invited, so that the information may relate to as wide an area as possible.

Police Instead of Tolls.

WHEN the automobile was attracting attention on British roads in pre-Victorian days the tolls levied on horseless vehicles were the great force that retarded progress. They were not reduced although the Parliamentary Committee said that such an opportunity should be given to assist the new locomotion. Mr. Gurney has given the following specimens of the oppressive rates of tolls adopted. On the Liverpool and Prescott road his carriage would be charged £2 8s., while a loaded stage-coach would only pay 4s. On the Bathgate road the same carriage would be charged £1 7s. 1d., while a coach drawn by four horses would pay 5s. On the Ashburton and Totnes road Mr. Gurney would have to pay £2, while a coach drawn by four horses would be charged only 3s. On the Teignmouth and Dawlish roads the proportion was 12s. to 2s. Tolls have gone, save in the few cases now being watched by the Motor Union, but the vigilance of the police is really an excellent substitute and is a serious matter for many men. Despite the thoughtless utterances of many persons, it is the fact that motorists are not necessarily millionaires, and the ordinary individual having a car does not like to add the risks of heavy fines to the usual running expenses. In some towns in the south of England the fear of police prosecution is strong in the land and a deterrent to men becoming the owners of even a second-hand automobile. This is an aspect of the restriction of business associated with the present policy of the police that is sufficiently serious to warrant the attention of the motoring organisations south of the Thames.

The Noise of Syrens.

CAPTAIN SERGISON, J.P., who was mainly instrumental in the action taken by the people of Handcross to secure a ten-mile motor-car speed limit through the village, has informed a public meeting of residents that he hoped before long to see steps taken to check the abominable noise made by the syrens of "road hogs" travelling from London to Brighton. The clerk to the East Sussex County Council had told him that, owing to the wording of the Act, he did not think action could

be taken, but he (Captain Sergison) had since communicated with a high Local Government Board official, who suggested that the County Council should take action, and then test the decision in the Court of Appeal. Whether the authorities are likely to act on the hint thus conveyed is extremely problematical in view of the fact that legislation with regard to motor vehicles generally cannot be long delayed.

Cars and Hounds.

MOTORISTS and huntsmen will have common cause for agreement over the letter from the Master of the Craven hounds, to which we give publicity on another page. While the natural feelings of Mr. Yorke Scarlett find vent against the offender in his letter, we must say that there is ample excuse, and all who drive will deplore such actions as those described.

seat fixed to the frame of the car over the footstep, on which the passenger or driver could rest his feet. The notion was ingenious, and, like many other useful ideas, quite simple in its execution.

Competition for Motor Body Builders.

PRIZES are being offered by the Company of Coach Makers for competition among those engaged in the trade of motor body making and accessory industries. The competitions are for drawings of a motor phaeton to carry two on the driver's seat and one on a small seat behind, and also for the working drawings of a side entrance motor-car body to seat seven persons. For those of a literary turn of mind essays are invited on the best system of keeping a motor-body builder's accounts of prime cost. Drawings and essays are to be delivered to the hall

Colonel Sir Lorenzo Dundas, K.C.B., Honorary Colonel London Fusiliers, Finsbury Barracks, and his 20-h.p. Beeston-Humber. The illustration is reproduced from a photo taken last week on the Colonel's return from Buckingham Palace, when he was invested with the K.C.B. by the King. The Colonel, who is an old Crimean veteran, having been present at the siege of Sebastopol, is an enthusiastic motorist.

Motorists as a body are as gentlemanly and humane as any other class of the community, but, like other people, they suffer incalculable loss of prestige by such wantonness as that of which the Craven pack has been a victim.

Where shall the Mechanic Sit?

OFTEN does the owner of a car wish that he could secure another seat on his vehicle for any friend he may happen to meet when out motoring. Then it sometimes comes about that the mechanic is invited to a seat on the footboard—a comfortable position, away from the wind and sheltered from the world to a great extent. The other day, outside the premises of the Motor Club in Coventry Street, W., we espied a vehicle the owner of which had overcome the difficulty by having a small

of the company in Noble Street, St. Martin's-le-Grand, London, W.C., before April 30th next, and further particulars can be obtained from Mr. T. H. Gardiner, the clerk of the company, at the address given.

Place aux Dames.

AS already announced in these columns, ladies are not to be admitted as graduates of the Incorporated Institution of Automobile Engineers—a decision which has been come to after little discussion, it being generally felt that although ladies have distinguished themselves as drivers of motor vehicles they have not yet, in any considerable numbers, begun to qualify as practical engineers. At the same time they will recognise how welcome has been their assistance in the various organisations,

of the sport, both the Motor Union and the Automobile Association having a goodly number of the fair sex included in the roll of membership. Success, too, has attended the special organisation for lady motorists, namely, the Ladies' Automobile Club, the membership of which has nearly reached the limit originally agreed upon by those who were energetic and far-seeing enough to found that useful association.

Motorists' Defence Fund.

ALL motorists derive benefit from the annual outlay of the Motor Union in connection with its Legal and Legislative Defence Fund. The particular expenditure relates to the fighting of test cases of importance to automobilists generally. Car owners, therefore, will be interested to learn that just now the annual appeal is being made for the Legal and Legislative Defence Fund, the objects of which are as follow:—1. Settling important points of general principle by taking test cases to the High Court. 2. Opposing (a) applications to close roads which are suitable for motor-car traffic, (b) unreasonable applications for a 10-mile limit of speed, and (c) other proposals of public authorities unfairly restrictive of automobilism. 3. Assisting, under

there it is. There is nothing more to be said. Forty shillings." Coming down to plain prose, the only way to disprove the police evidence in such cases is to be provided with a speedometer—and even then there is a doubt as to whether magisterial prejudice will not discount the reliability of such a device.

The Careful Driver.

UNDER the auspices of the Education Committee, a lecture on the motor-car has been given by Mr. George Hawley at the Sutherland Institute, Longton. He remarked that as a rule a person who had been accustomed to driving horses upon

the roads made the most considerate and careful driver of a motor-car. It should be the object of a driver to proceed cautiously, remembering that others besides himself had a right to the highway. It was always advisable to slacken speed and sound a warning when passing a cross road. Nothing was more objectionable than to meet a high powered car on the road when there was a lot of dust about, travelling at a speed which created a cloud of dust it was impossible to see through. From his experience, few motor-car drivers had the slightest consideration in this respect. We are afraid that Mr. Hawley has been unfor-

special circumstances, members summoned under the provisions of the Motor Car Act. 4. Assisting members in appeals to Quarter Sessions. 5. Undertaking and supporting the prosecution of persons who have assaulted, obstructed, or thrown stones at motorists.

Magisterial Sympathy with the "trapped."

other day a chauffeur was summoned before him for driving a motor-car in Regent's Park at a speed beyond that allowed by the regulations. After listening to the case at some length the magistrate remarked that this was only one of hundreds of cases of the kind, and they all ended in the same way. There was really no escape unless the plaintiff could show that the timing of the park constables was wrong. "Here are these cold-blooded officials," continued the magistrate, "each with a stop-watch in hand. What possible chance has the chauffeur? My heart bleeds for everything in a trap, whether it is a chauffeur or a weasel. But

fortunate, for there is little doubt that the number of considerate drivers is greatly on the increase, and that with the growing motor traffic on the roads people recognise the need for care and thoughtfulness, not only for the safety of others, but also of the motorists themselves.

THE French Automobile Club proposes to organise a competition for motor tyre inflators during the coming season.

THE ACME RUBBER AND TYRE COMPANY, of 349, St. Vincent Street, Glasgow, are placing on the market a red non-skid band and also undertaking the repair of motor tyres at an inclusive weekly charge.

MESSRS. THOS. SCOTT AND CO., 231-2, Strand, W.C., have issued a diary for 1908 which includes travelling, accident, burglary, fire, and domestic servants' insurance, some notes on new laws, and all the usual features of such annual publications.

THE sport of motoring is progressing apace in the Argentine Republic, the last mail from Buenos Ayres bringing details of a successful gymkhana which had just been held, as also of a race for motor-cycles and light cars organised by the Moto Club Argentine.

ACCESSIBILITY v. PERMANENCY.

BY CHARLES TAILLEUR.

THE cry for extreme accessibility is heard on every hand, and as a result the descriptive matter relating to the various cars contains the word "accessible" many times repeated. The question here asked is whether or not there is a danger of the factor of accessibility assuming undue importance in the eyes of the public and of designers, to the sacrifice of other equally important factors. There exists a demand for accessibility on the one hand, and for strength with lightness, efficiency, and what I will call "permanency" on the other. By permanency I mean the quality of "staying put," of maintaining the correct relationship between the various parts of the mechanism under prolonged service without constant supervision and adjustment. At the very outset the opposition of the two factors is evident, since in an ideally permanent mechanism, that is, a mechanism which would be absolutely unwearable and unbreakable under the worst conditions of legitimate use, adjustment or repairs would be necessitated solely by external accidental causes, and consequently the value of accessibility would be very slight. Similarly in any actual machine, the value of accessibility may be said to vary inversely as its factor of permanency, so that the greater the latter, the less the former. It would seem that the fact of accessibility being given so prominent a place in the design of a machine is a confession of possible, and more or less expected, weakness.

In those mechanisms the design of which has, through years of development and study, reached a scientific, as opposed to the original empirical basis, we do not find permanency sacrificed to any but manufacturing considerations. In marine engines, locomotives and tramcars, to take examples which operate under conditions similar to those which motor-cars have to contend with, accessibility is certainly not the keynote of design as it seems to be becoming in automobile work. It must not be understood that I fail to appreciate the advantages of "get-at-ableness" in every piece of machinery, and especially in motor vehicles. In my opinion, however, it should be provided with the intention of enabling the user to correct injuries caused by his abuse, rather than to rectify troubles arising from inherent defects in the machine itself. It may at once be objected that so long as accessibility is provided it matters not with what intention. There will be, however, a considerable difference in the means whereby it is obtained and the parts which are to benefit by it. Take, for example, an ideal car having the following characteristics:—Motor: very large bearing surfaces of the best materials; force feed lubrication, positive to each bearing, with filter system to prevent entrance of foreign matter with the oil; very large valves of special alloy, thoroughly water-cooled. Clutch: Multiple hardened steel discs, running in oil. Transmission: Gears of large dimensions; ball-bearings throughout; splash lubrication. Brakes: Metal-to-metal, with very large friction surfaces, enclosed in oil bath and water-cooled. Let us assume that such a car has proved its ability to run 10,000 miles without adjustment when properly operated. (And I maintain that it is perfectly possible and feasible to construct a high-priced car which will be capable of such a record.) The point now is to properly provide for faulty operation, so that those parts only which can be injured by carelessness are made accessible in proportion to the probable frequency of such abuse.

Beginning again with the motor, we find that the circulating pump may be allowed to freeze or may be injured by the entrance of foreign matter with the water supply if the filter screen at the filling plug has been removed. The pump should therefore be readily detachable. The magneto, if properly constructed and large enough for its work, will be perhaps as permanent as any other part of the entire car, though as at present constructed many of these instruments are delicate and subject to frequent derangements, not always attributable to abuse. The lubrication should be provided for by the main oiling system to reduce the liability of its neglect. The carburettor is subject to derangement only in the float chamber and

jet, unless it is of the type in which automatic operation is obtained by moving parts. The only cause of trouble here, apart from definite workmanship, will be impurities in the fuel supply. Both the float chamber and jet should be readily cleaned and inspected without the removal of the entire carburettor from its position. A system of filters and drains between the filling plug and the needle-valve would reduce the importance of accessibility in these two elements. The lubricator should have a most convenient feed adjustment for the cylinder leads, but need not otherwise be accessible, as the several filtering screens, at least one of which should be non-removable, will prevent the entrance of any body sufficiently large to interfere with the feed pump action, and the mechanism is otherwise quite permanent. The high-tension distributor should be placed so that the sparks at the distribution points may be observed through a glass or mica plate, but if it is well

Touring in Spain.—A 35-h.p. Daimler Car about to enter the town of Fuenterrabia, on the borders of France and Spain.

made and dust-proof there is little need of further accessibility. The same may be said of the primary contact-breaker.

Coming now to the motor itself, we find that there are only four forms of abuse which a thoroughly well made motor cannot be expected to endure: Lack of lubrication; excessive lubrication; lack of water; and freezing. With a well-designed and constructed force feed oiling system no adjustment should be provided except for the cylinder leads, consequently there will be no question of improper lubrication of any of the bearings unless the oil reservoir has been allowed to become empty, in which case all bearings will probably be more or less injured and one or more quite ruined, perhaps, before the motor is stopped. The cylinders may be more or less damaged, depending on whether piston or bearing seizing occurred first. In either case a general dismounting of the motor will be necessary for thorough inspection before the car should again be placed in service. Accessibility to the cylinders and bearings when mounted in the car is thus seen to be of minor importance. It must be understood that the lubricating system of which I speak is one in which each bearing is supplied, not by springs or limited pressures, but by positive-acting mechanism without spring valves, and of such construction that possible obstructions

in the system will either be removed by the action of the feeding device itself, or will cause destruction of the latter. Each feed must be wholly independent of every other one, so that the pressure upon an obstructed lead cannot be relieved by an increase in flow through another. Since adjustment must be provided for the cylinder feeds, owing to the exactness of their requirements, they may be either starved or flooded by the unskilled or careless operator, independent of the bearings. Starving will perhaps necessitate the dismantling of one or more cylinders, and this should therefore be possible without removing the motor from the car.

Flooding, a not uncommon evil at present, will require cleaning of the combustion chambers, valves and piston head, and these should be accessible for this purpose, if possible, without dismantling the cylinders—a requirement which is seldom met. In my experience I have found the formation of carbon deposits within the combustion chamber to be the cause of a number of annoying minor disorders which are not uncommon in the best of modern motors, and which are given less attention than they deserve. As a matter of fact, the running of a motor will be very perceptibly "sweetened" by a careful cleansing of the combustion chamber walls once every 2,000 miles or so, unless both carburettor and lubricator adjustments are extremely perfect.

Coming now to the clutch, the wear of the hardened steel plates is practically negligible. Lubrication is thorough and independent of the driver, for, in addition to the oil originally placed in the case, there should be an excess feed from the motor. If, then, the clutch should even be assembled without oil, a little running of the motor will soon provide sufficient to prevent damage occurring. About the only element in such a clutch which might give trouble will be the operating spring, which is therefore the only one for which accessibility need be provided.

The transmission we have assumed to have a large factor of safety and to be made of the best obtainable material. With the small diameter multiple-disc clutch, the rotary moments while clashing are only about one-tenth, those occurring under similar conditions with a cone clutch of equal torque capacity. The chipping of the edges of the gear teeth may thus be entirely eliminated, as is abundantly proven by experience. The actual wear on the teeth faces is negligible, and the oil within the case will not be rapidly charged with chips and grit, as has been usual in the past. Under these conditions of lubrication the best ball bearings will last indefinitely. The permanency of the gear-box is then independent of the operator, and the only troubles which can arise are those due to wilful abuse or accidents involving more or less the whole car, and requiring the dismantling of the case. Accessibility is thus not only unimportant, but in my experience actually dangerous, as it increases the chances of foreign bodies accidentally getting into the case during perfunctory inspections. In both crank-case and gear-box inspection openings greatly weaken the structures, especially reducing their rigidity, by breaking their continuity, thus necessitating additional weight for equal efficiency. Experience has further proved that well-designed brakes of large dimensions running in oil, and perhaps water-cooled for extreme conditions, are permanent mechanisms within ordinary engineering limitations. Whatever adjustment is thought necessary should be provided externally so as to be accessible without disturbing the brake proper.

Of the remaining elements, the steering gear deserves notice from the fact that although not ordinarily sacrificed to accessibility, durability seldom seems to be obtained in the degree which this most important part demands. Friction surfaces are too small, the selection of materials leaves much to be desired and the workmanship usually bears evidences of speed rather than painstaking care. This is true not only of the steering box alone, but throughout the entire steering system. It is true that, once accustomed to the operation of even a high-speed car, backlash in the steering gear does not materially inconvenience the driver under ordinary conditions, but in emergencies it may be fatal. Adjustment to take up wear in the steering gear is, it would seem, unnecessary, and the means whereby it is provided are frequently most insecure and unreli-

able. A thoroughly well-made steering gear should be capable of standing up to its work for 50,000 miles without the appearance of over 15 deg. lost motion at the steering wheel. It should be entirely self-lubricating, and no thought need be given to making it accessible without dismantling it from the car.

The whole matter seems to me to stand thus: The finished design of any machine is a crystallization of the thoughts and purposes of its designer. So long as the "motif" is to construct a car which shall be accessible and easily repaired in all its parts, just so long will the demands of permanency be more or less subordinated to the former, and the finished product will bear evidences of the relative importance attached by the designer to these two frequently antagonistic requirements. To force the designer and manufacturer to do his best, underrate the importance of accessibility in his products instead of, as at present, overrating it. The motor-car will ultimately be developed into a consistent machine in which all the various requirements have been carefully weighed and their relative importance accurately found, after which the design and execution has been harmoniously developed. In my opinion we shall see, in the car of the not so very distant future, the factor of permanency accorded its true position—that of the

A New York firm recently celebrated the supersession of horses by motor-vehicles in the novel way depicted above. The animals were carried round the city on the motor-wagons which had displaced them, the unusual sight naturally attracting considerable attention.

cornerstone upon which the whole structure is built. More judgment will also be used in providing accessibility instead of blindly attempting to give instant access to every part of the mechanism, whether in all likelihood it will ever be required or not. Old motorists, who began their career eight or nine years ago, as I did, may not yet have forgotten the tortures endured in attempts to extract parts from the vitals of one of those dear old cars which have since passed to the scrap heap, but let them stop and think how many times they have been obliged to reach internal parts of their newer machines from unavoidable causes, that is, causes which the factory, either in the drawing-office or machine-shop, could not have prevented had they foreseen them.

MESSRS. SKINNER, of Western Road, St. Leonards, teach the driving of motor-cars, as well as the riding of horses.

FROM the Westinghouse Brake Company, Ltd., we have received a very complete catalogue of the Morse Rucker Joint Chains, which are now being extensively used on motor-omnibuses and commercial vehicles, as well as in many industrial installations, in place of belt and gear transmission. Not only are full particulars given of the chain, but the list includes a large number of illustrations showing the various uses to which it has been applied.

THE ZENITH AUTOMATIC CARBURETTOR.

MANY attempts have been made during the past few years to devise a carburettor which shall give a perfect mixture under all conditions of running; among the latest to come under our notice is the Zenith, devised by M. Beverly and put on the market by Messrs. Boulade Frères, of Lyons. As will be seen from an inspection of the sectional view given herewith, the apparatus is on entirely

Section of the Zenith Carburettor as now fitted to Rochet-Schneider Cars.

new lines, the principle adopted being that of doing away with all supplementary air inlets, and having only one air-admission pipe of a fixed area, but at the same time providing two spraying jets, one working in the usual way and the other known as the compensator. The two jets work simultaneously and in sympathy one with the other, in such a way that it is claimed the carburettor gives a perfect mixture under all conditions.

Referring to the drawing, the two jets *gh* are arranged concentrically, the one within the other. The former draws its supply of petrol from the float chamber *v* in the usual way, while *h* is supplied from a tube *j* open to the atmosphere and fed with spirit through the jet *i*. Owing to the fact that the suction of the engine has no effect on the flow of spirit through the opening *i* into the chamber *j*, the supply to the latter is maintained at a constant rate. Within *j* is a small tube *o*, open at the bottom and communicating with the admission pipe through a small hole *u* just at the point covered by the butterfly throttle valve when the latter is closed. Under ordinary conditions the action of the small tube *o* is nil. There are two cases, however, in which it comes into action, viz., (1) when the engine is stopped the chamber *j* becomes filled with petrol, and the starting of the motor is facilitated by reason of the strong suction at the opening *u*, where the reserve supply of petrol is drawn directly into the admission-pipe, enabling the engine to be started at the first turn of the handle without any preliminary flooding of the carburettor. The second use of the auxiliary chamber *j* is when the engine is running light and at a slow speed; the suction on the concentric jet is then very weak, and is insufficient to draw off the petrol in the chamber *j*. The spirit consequently rises in the latter until, meeting the end of the small tube *o*, it is quickly drawn up and sprayed into the inlet pipe, through the

opening *u*, to give a mixture exactly proportioned to the requirements of the engine at the speed at which it is running. A gauze screen is provided at *k* to prevent any dust or foreign matter being drawn into the chamber *j*.

The carburettor has been subjected to very exhaustive tests by the makers, who claim that it furnishes a perfect mixture at all engine speeds from 150 to 1,500 revolutions per minute, and that without the use of any auxiliary spring-controlled air inlets, which frequently need adjustment; furthermore, not only does it permit the engine to respond instantly to any movement of the throttle lever, but an economy is effected in fuel consumption. The carburettor is being taken up by the Rochet-Schneider Company, and by the courtesy of Messrs. Donne and Willans, Ltd., we had an opportunity the other day of inspecting the apparatus in operation on one of the latest Rochet-Schneider cars, when the readiness with which the engine immediately responded to any movement of the throttle lever was particularly noticeable.

A BELT-DRIVEN MOTOR LORRY.

AMONGST the oldest builders of industrial motor vehicles in France is M. Ch. Pantz, of Pont-a-Mousson (M.-et-M.) who is making two sizes of chassis—9-11-h.p. and 12-15-h.p.—for loads of from 1½ to 3½ tons. The feature of the Pantz vehicles is the employment of a long crossed belt to connect the engine with the change-speed gear, from which the transmission to the road wheels is by side chains. A plan and elevation is given herewith. The engine, which comprises two horizontal cylinders, is arranged in the fore part of the frame, under the driver's foot-board. The carburettor is of a special type adapted to work equally well with heavy oil as with petrol. The gear-box gives four speeds, in addition to the reverse. The maker claims that the lorries are easily able to mount gradients of 1 in 10 fully

loaded, and that on average roads the consumption of fuel is only 2 litre per ton-kilometre. The object of the designers has been to produce an efficient vehicle and one which at the same time shall not only be simple, but in which all the parts are readily accessible.

During the recent military manoeuvres in France a Pantz 12-15-h.p. motor-lorry carried a load of 2.8 tons during a period of fifteen days, during which no breakdowns or stoppages for repairs occurred.

CONTINENTAL NOTES.

Industrial Vehicles at the Paris Show.

The importance of the industrial vehicle section of the recent French *Salon* was not over-rated when the organisers designed the construction of the huge temporary building erected on the Esplanade des Invalides. The space available for exposition was as much as that on the ground floor of the Grand Palais, and it was taken up by exhibitors of all kinds of apparatus directly or indirectly affecting the motor-car industry. The "clou" of the commercial show was undoubtedly the attraction offered by the retrospective exhibition of cars. The latter, of course, contained all sorts and conditions of cars, from the earliest to the latest, and had as much to be examined in common with the industrial side of the art as with the pleasure car. For

period with the splendid specimens of industrial motor vehicles which followed closely on the retrospective display. Taken as a whole, the recent show was the most representative collection of commercial cars of all kinds and industrial applications which could well be got together on the Continent. There is scarcely one of the well-known French motor-car firms which does not now advertise its industrial applications. Hitherto many makers allowed the commercial motor to be neglected and gave themselves up entirely to the construction of touring cars. This is entirely ended, and the industrial motor will in future receive as much attention as the pleasure side of motoring. Even more, since there are several firms which construct commercial cars and do not offer any pleasure chassis at all. The motor-cab caused the last stage of this reunion of forces to be bridged, for no constructor however given to the design of

Touring in France.—A View of Pau, showing the Castle.

instance, the first effort—at least, in France—to make a road machine was that of the military genius, Cugnot, in the year 1769. This three-wheel car was undoubtedly destined for transporting heavy weights, since the rear part is not very different in principle to the motor-lorries of to-day. Later on in the history of the road car we find that all the first efforts were directed to commercial application, witness the steam road coaches and omnibuses of the 'seventies. It was only about 1897 to 1898 that the possibilities of the pleasure car appeared to dawn on constructors, and the impetus given by the organised road races caused the pendulum to swing to the glamour of speed trials and sport, rather than to the normal development of the industrial side of the trade, which received a set-back in consequence, lasting for several years. A deal of experimental work was saved to the commercial car makers as a consequence, but exactly how much more the industrial motor owes to the pleasure car on this account is not an easy matter to solve. The struggles which the industrial motor might have gone through during the early days of the present century were, however, apparent from a comparison of the cars of that

purely pleasure cars, could afford to see an order for taxicabs go to a competitor simply because he was not ready with his designs.

The 1908 A.C.F. Grand Prix Race.

According to the "Auto" French motor-car builders are already busily engaged on the construction of their vehicles for the 1908 Grand Prix Race. The rules provide for a maximum bore, in the case of four-cylinder engines, of 155 mm., a dimension which will most probably be generally adopted. Panhard-Levassor's are stated to be building three entirely new live axle cars, the engines of which will have a stroke of 175 mm. The Clement-Bayard Company are designing three types of engines of respectively 155 mm. by 165 mm., 155 mm. by 175 mm., and 155 mm. by 188 mm. bore and stroke. The second of these is the most favoured. The cars, which are expected to develop 130-h.p., will have cardan shaft transmission. The De Dietrich cars are expected to have four-cylinder engines, 155 mm. by 172 mm., high-tension ignition, direct drive on two of the speeds, and side-chain. The Motobloc

engines will have a stroke of 170 mm., as will also the Pipe (Belgian) motors, the valves in both cases opening direct into the explosion chamber. Fiats (Italian) are credited with two sizes of engines, 155 mm. by 160 mm. and 155 mm. by 170 mm.; a selection being made after exhaustive tests of both types. The Benz and Mercedes (German) engines are said to be of a bore and stroke of respectively 155 mm. by 175 mm. and 155 mm. by 170 mm. The transmission on both cars will be by side chains. No details have transpired with regard to the Renault programme. All the foregoing, as well as Brasier, are looked upon as certain starters in the great race; newcomers will be found in the Charron and Breguet firms, the latter's cars being fitted with six-cylinder engines, while the Westinghouse are also expected to be in line. On the other hand there is some doubt as to whether Hotchkiss, Mors, Gobron and Porthos will compete.

Motor Roads for Paris.

Those motorists who are accustomed to tour in France will be interested to learn that the French Automobile Club and the Touring Club de France have been successful in their agitation for new motor roads in the environs of Paris. The Minister of Public Works has definitely decided to commence at once and complete within two years eight new motor roads north, south, east and west of Paris. The roads decided upon are used to some extent at present, but, speaking generally, the surface is of *pavé*; they are, however, to be relaid with small stones well bedded so as to provide a smooth dry surface suitable for motor traffic. The eight roads will be connected at different points by a more or less circular route with a radius varying from eight to about eighteen miles, so that travellers will be able to circle round the city without touching it until they strike the particular main route which they desire to follow.

The French Automobile Industry.

The annual banquet of the French *Chambre Syndicale du Cycle et de l'Automobile* was held in Paris last week, the function being attended by several members of the Government. After the loyal toasts had been duly honoured, M. A. Darraeq, the President, made an interesting and instructive speech, in which he referred at length to the crisis through which the French automobile industry is stated to be passing. He held that the change that was taking place was only that experienced in all revolutionary movements in which it is difficult to at once establish an equilibrium between supply and demand. That a change was going on and that the automobile was no longer to be confined to the rich, but was taking its place in the general means of locomotion, was certain. The well-to-do *cientele* was now of less extent than formerly, and the tendency of the times was to a development in the demand for small cars for individual use and for heavy vehicles for public service and goods transport work.

Miscellaneous Items.

There is stated to be a demand for motor lorries for the transport of cereals in the Konia district of Turkey.—The Parisian police are now summoning motorists and motor-car drivers for allowing their motor lamps to smoke.—An exhibition of industrial motor vehicles was held in Berlin from the 19th to the 22nd inst.—“Nonaera” is the name given to a new motor tyre somewhat on the lines of *Elastes* which has just been introduced by a Dusseldorf company.—Three Fiat cars have already been entered for next year's Targa Florio Race.—An asphalt pavement repairing company in Berlin is now using a petrol motor wagon for the transport of its material about the city.—A number of Krieger petrol-electric taximeter motor-cabs are now in service in Paris.—A company has just been formed in Cologne with the title *The Kölner Automobil-Droschken-Gesellschaft* to introduce a service of electric motor-cabs in that city.—A competition of “elastic” wheels for motor vehicles will be held by the “Auto,” of Paris, from the 7th to the 17th April next.

SOME USEFUL NOTES.

THE rubber mats on a car should be cut to fit exactly; the best way to secure a proper fit is to make a pattern out of brown paper, cutting it so that it sets snugly over the flooring in one piece. Holes should then be made for any pedals, pipes, &c., with a slit to allow the mat to be fixed round the same. Care should be taken to see that the mat fits close up to the dashboard.

ALMOST any cable will safely carry the low tension current, but no cable can be too well insulated or of too good a quality to carry the high tension current from the induction coil or magneto to the sparking plug.

ABSOLUTE certainty in the lubrication of every bearing proportionate to the speed at which it runs means economy in oil—for one drop of oil delivered regularly to exactly the right spot will go further than twenty drops used irregularly.

ONE of the worst places to put ignition wiring is near the silencer or exhaust pipes, or any other place where there is much heat. Even if there is not sufficient heat to burn the insulation, the material will deteriorate and become practically useless in time.

CERTAIN forms of cardan joints—notably those employing the so-called Greek cross—have propeller shafts employing a bolt similar to A in the accompanying sketch. If this bolt is threaded into one jaw of the yoke B, as shown, and is held against turning merely by a locknut C, it will be impossible to keep the bolt tight, as the twisting effort due to the friction of the cross on the bolt, combined with the vibration, will quickly loosen it, and the sole reliance against trouble is then the cotterpin which holds the nut from coming off. Aside from other objections to this feature there is a tendency to transfer the rubbing surfaces to the points D and E. One way to prevent this is to file a slot in the head of the bolt, and after it has been screwed tight to hold it by a screw F, which partly enters the slot in the head. Another method is to strengthen the bolt at D by a shoulder as shown at G in the detail sketch. This makes it possible, remarks the *Motor Age*, to put a cotterpin through the bolt and the jaw in which it is held. If the bolt were not shouldered it would be liable to break where drilled for the cotterpin.

WORN connecting-rod bearings, both at the piston and crank shaft ends, usually cause a loud hammering sound. When first noticed, the defect is pronounced and disagreeable only so long as the motor is operated with the spark retarded. It can then be avoided for the time by using an advanced spark, or high motor speed. If allowed to continue, it soon gets much worse, and is heard with regularity in whatever manner the motor is operated. A slight and unobjectionable hammering sound when the ignition is first advanced is normal for single or double-cylinder motors, but generally indicates faulty manipulation of the levers.

IT should not be forgotten that it is possible, as a last resort, to use the engine as a brake, if the brakes themselves refuse to work; and one should be prepared to act upon this information in an emergency. By running on the low gear, with the engine at lowest speed, the velocity of the car cannot become great, while a powerful brake is obtained by switching off the ignition.

AN AMERICAN PETROL-ELECTRIC ROAD TRAIN.

CONSIDERABLE interest is being taken on the other side of the Atlantic in a new road train which has been introduced by the Alden-Sampson Manufacturing Company, of Pittsfield, Mass., U.S.A.—a concern which it is stated has for the last six years been experimenting with heavy industrial vehicles. The train consists of a tractor and two followers, each provided with six wheels, with spring suspensions so arranged that half of the load of each car is carried by the centre pair of wheels, which are the drivers. The pair of wheels at the front and rear ends of each car are steering wheels, and are connected by linkage in such a way that all six wheels of any one car will travel arcs of concentric circles in turning. The driving wheels are 54 in. in diameter and the steering wheels 42 in., all equipped with steel tyres 5 in. and 3½ in. in width, respectively.

Although, as in the Renard system, the first vehicle is not a tractor in the usual sense of the word, but is an automobile

tion which can be made at either end of the cars, the steering linkage being so designed that the cars will track exactly on the sharpest turns when running in either direction. Drawbars are used between the vehicles, but as each car is self-propelled their only function is to preserve correct distances and equalise traction.

Under ordinary conditions braking is effected electrically through the motors by the controller. This is claimed to give an amount of braking power equal to the capacity of the motors, and is very smooth in operation and easily handled. For emergency use on steep hills a hand wheel directly beneath the steering wheel of the tractor is used to operate powerful expanding shoe brakes within the driven sprocket drums of the tractor's driving wheels. The same brake apparatus is fitted to each car, this being arranged to be operated, in hilly districts, by assistants riding on the vehicles. The car platform is 17 feet long by 4 ft. 2 in. wide, and is supported 4 ft. above the road surface. The wheel track is 6 ft. Each vehicle has a capacity of six to eight tons, and in order that the weight of the tractor with

The Alden-Sampson Petrol Electric Road Train.

power generating plant, the means adopted to drive the following vehicles are electrical instead of mechanical. In fact, the plan adopted—for the first time, we believe—is an extension of the petrol-electric type of motor vehicle, the electrical energy generated being distributed to electric motors on each unit of the train, instead of only to the machine on which the power plant is installed. The latter consists of a 50-h.p. four-cylinder petrol motor, connected by a silent chain to a 35-kilowatt dynamo. The engine and dynamo are separately suspended by springs on the tractor in order that road vibration shall not be communicated to them. The electric current generated is conducted to the motors, of which there are six—two on the tractor and two on each of the followers. In the controller switches are provided which enable the tractor to operate the train or each unit of the train with that unit's own motors. The motors are spring-suspended and drive the central driving wheels through spur gearing and 1½ in. pitch roller chains. Since each driving wheel has its own electric motor no differential or equalising gear is needed. The complete control of the train is electrical, which enables it to be easily handled by one man. The tractor, which it is claimed can turn in a radius of 20 ft., is steered by means of an irreversible gear, and each of the cars is steered from the one preceding it by means of a tongue connec-

the train in operation may be equal to that of each of the cars it is provided with a platform upon which may be carried a load of from three to four tons. The bodies of the trucks are mounted upon four heavy springs, one end of each extending to the axle, to which it is securely fastened, while the inner ends are connected to the central axle, all axles being stationary. The trucks are all linked by coupling rods to the tractor. The train has been designed with a view to supplying the need in many industries of an economical method of transporting merchandise for considerable distances over ordinary roads. On first-class macadam roads the speed of the train is given as six miles per hour. As will be seen, the Alden-Sampson road train forms an entirely new departure, and one the development of which will be watched with more than passing interest.

BLINDLEY HEATH, near Godstone, was flooded the other day for quite half a mile, and in places the water was three or four feet deep. A number of motor-cars proceeding in the direction of Lingfield made attempts to dash through the flood. In each case the chauffeurs were stranded, and the local farmers for several hours were busily employed with teams of horses dragging the cars on to terra firma.

MR. GIBBON BROOKS has been making a display of various non-skidding devices at his motor establishment in Cardiff.

THE Dunlop Pneumatic Tyre Company intends to establish works in London for dealing with tyre repairs.

MESSRS. WYMAN AND SONS, LTD., the well-known printers and official agents for Government publications and Parliamentary papers, have issued neat wall calendars for 1908.

AT Stamford Mr. J. T. Rollings has a large garage in Scotgate. A good stock of spare parts is kept and tyre repairs, as well as "first aid" to motor-cars are carried out by a competent staff.

ACCORDING to a police witness in a case at Kingston, 714 motor-cars passed along the Portsmouth Road at Esher on the occasion of the motor races at the Brooklands track on October 12th last.

THE erection of road directory boards is becoming a feature on some of the main roads in Cincinnati. On these is printed a variety of information as to distances between various points, on similar lines to many of the route books issued in this country.

MOTORISTS who are troubled with cold feet from contact with the cold metal of the pedals will find that ordinary tyre tape wound around the same will overcome this difficulty and at the same time provide an excellent adhesive surface upon which the feet will not slip.

THE Cambridge Auto-car Company, Ltd., 58, Hills Road, Cambridge, have published "The Shu-ver's Catechism," by Mr. F. W. H. Hutchinson. This contains four pages of questions and answers for drivers, a list of motor-car identification marks, and a ruled account page for a record of mileage, and the cost of running a car for a year.

THE New Engine Motor Co., Ltd., have secured an order for a 40-h.p. limousine with front seats completely closed in, for H.H. the Thakore Sahin of Gondal for use in India. The vehicle will be able to carry nine passengers in all, and we believe the owner intends to have two syces, or native servants, standing on the platform at the back. The top and sides of the car will be removable from end to end, so that the car can be used as a completely open one.

AT the last meeting of the Solihull District Council the Clerk read a letter from the Warwickshire Highway Protection League, urging that the present speed limit for motor-cars should be strictly enforced in the country, with a maximum speed of eight miles in passing through villages and towns; that the tax on motor-vehicles should be increased, and the proceeds devoted to highway repair; that one licence for testing any number of cars should not be issued to manufacturers, and that the highways should not be used for motor testing on Sundays. The league asked that a resolution in these terms should be passed and sent to the County Council and the Local Government Board. Mr. Oscar W. Bowen moved that the Council pass a resolution as suggested. This was seconded, and carried *nem. con.*

THE Union Trust Company, a well-known banking concern of San Francisco, has acquired a motor-car for use in connection with its business.

A GARAGE has been established by Mr. E. E. Parlyby in connection with the Berkeley Arms Hotel, Cranford Bridge, near Hounslow, which he has just taken over.

MESSRS. ARGYLLS, MIDLANDS, LTD., have fitted up a convenient showroom at 24, New Street, Birmingham, from which Mr. Henry Garner will direct operations over the counties of Worcester, Warwick, Hereford, Stafford, and Shropshire. A garage and repair works are also being established in connection with the showroom.

MESSRS. A. WEBSTER AND CO., 43, Dover Street, W., again issue their annual register of sporting and social fixtures and diary known as "The Badminton." Some pages are devoted to motor records at home and abroad, and the Diary seems to be fully comprehensive.

MESSRS. BENSLEY AND DEDMAN, of 720-722, Holloway Road, N., have been appointed sole London agents for the Brewt-nall radiator, which is claimed to have a very high efficiency combined with mechanical strength. A feature of the cooler is the small number of tubes and tube joints.

MESSRS. GOULD BROS., motor engineers, of Exeter, have been causing considerable excitement at their attractive showrooms in Southernhay, by exhibiting a quarter size model aeroplane which has been designed by Mr. Ernest Gould, the managing director of the firm.

ELSEWHERE in the present issue will be found an article from the pen of Mr. Charles TAILLEUR, taken from our American contemporary, "Motor," on the subject of "Accessibility and Permanency." Since Mr. Martineau's paper read before the members of the Institution of Automobile Engineers considerable interest has been shown in the question of accessibility, and, as Mr. TAILLEUR deals with the matter from a somewhat new aspect, his remarks are worthy of careful consideration.

THE Crawfordsville Casket Co., of Crawfordsville, U.S.A., recently purchased a motor-car for the use of one of its travelling representatives, who has a territory extending for 100 miles in each direction. A marked saving in time and expenses has been effected by means of the vehicle. The economy in time is especially noticeable, as the traveller is now able to cover twenty-nine towns in one week, whereas when he formerly had to rely on railway connections he could only visit sixteen.

THE sanction of the Croydon Borough Council has been asked to an arrangement for the borough engineer to have an allowance of £110 a year for a motor-car. Several members objected to any agreement of the kind, which, with the proposed employment of a fireman as chauffeur, would cost £60 a year more than the present supply of horse-drawn vehicles. At the same time the claims of the medical officer and the road surveyor to better travelling facilities were put forward. In the end the proposal was withdrawn in favour of a report on a more comprehensive scheme of motor-car hiring for officials.

Car overturned by fall of a Bridge over the Mishika. (See page 967.)

Photo by]

[Prince Borghese.

THE Royal A.C. is again appealing to motorists not to use the siren. Its use on motor-cars is prohibited in Paris.

LORD G. DUNDAS, of West Hall, Middleton Tyas, has just acquired a 15-h.p. Coventry Humber car.

THE Belgian annual motor-car show was opened in the Palais du Cinquantenaire, Brussels, on Saturday last by King Leopold. It will continue until January 2nd.

MESSRS. HEIGHTON'S DEPOTS, LTD., have establishments in West Gate, Peterborough, and at Thrapston and Whittlesea, where the requirements of motorists can be attended to at any time of the day.

WHAT the American papers call a "Quaker City Brooklands" is being projected at Philadelphia. This is a two and a half mile motor track in Delaware county, a club having been formed to undertake the work.

AMONG the new Jones devices for the registration of the speed of motor-cars placed upon the British market by Messrs. Markt and Co. is the new combination speedometer illustrated herewith. This is well calculated to supply the demand for a reliable and comprehensive instrument at a moderate price. As will be seen, the instrument registers the speed in miles per hour, the mechanism being the same as in the standard models. In addition there is the odometer or mileage recorder, which is

detached from the body of the device, a Veeder instrument being attached directly under the body of the speedometer by suitable gearing. By this means a triple combination is provided, securing the reading of the miles per hour, the extent of the trip and the mileage for the season up to 10,000. Another adaptation of the idea is given in a further model, which gives the rate of speed and the season's mileage. We understand that delivery of these excellently-designed Jones speedometer-odometers will be made early in the New Year.

ACCORDING to the report just issued the motor-buses in service in Paris covered during the 141 days ending with November 1st last 3,570,000 kilometres, during which time they consumed 22,000 hectolitres of carburetted alcohol.

THE Manufacturers' Association of Great Britain has been officially notified that, in consonance with its representations to the Australian Commonwealth Government, the duty on motor-lorries, wagons, and motor-cars has been altered from 35 per cent. general tariff and 25 per cent. preferential tariff to 5 per cent. general tariff and British productions free. The duty on catalogues, price-lists, showcards or pictures issued by or referring to goods of manufacturers or producers not having an established place of business in Australia has also been entirely removed.

SEVERAL sites are available near the Great Western Railway route for the establishment of motor and other works.

MOTORISTS have been warned as to the excessive speed at which some of their number drive through Sefton Park, Liverpool.

"TOMPKINS is having an awful time with his new car." "In what way?" "Every time he repairs it he has a lot of parts left over that he can't find a place for."

SUCH is the amount of work which Messrs. Argyll Motors, Ltd., have in hand that from the 23rd inst. the whole of the works will be on full time.

WITH the new year a scale of fares for horsed taximeter cabs of 6d. a mile or twelve minutes and 3d. a half mile or six minutes will be adopted in the Metropolis, while the abolition of the cab radius for these vehicles is also contemplated.

ON the afternoon of the 18th Mr. S. F. Edge gave the 90-h.p. Napier a chance of making fresh world's records on the Brooklands track, at Weybridge. Unfortunately, after the car had done eight laps at an average speed of slightly over 100 miles per hour, the two offside tyres flew off, so the attempt to create fresh speed records had to be abandoned.

WHITAKER'S ALMANAC for 1908 is again before us in the familiar form and cover in which it has been issued for a good many years. Among the new articles will be found a precis of the amended Patent Law, a digest of the Employers' Liability Act and other chapters which bring the information well up to date in accordance with new legislation. The official section is as complete and authoritative as ever.

THIS is the eighth year of issue of the "Daily Mail" Year Book, which constitutes a good handbook to current questions. In the section devoted to travel we are truly told that the most noticeable feature about the traffic of London at the present time is that mechanical traction is replacing horse traffic. There are articles on the problems of the roads, the progress of aerial navigation, and the advance of the motor-car. The latter is written by the Rev. Arundel Whetton, who, in reviewing the mechanical advance during the year, refers to the principle adopted in the Gillett-Lehmann patents in connection with carburation. Encouragement is also given to the endeavours made to popularise benzol and alcohol as a substitute for petrol and, on the business side, figures show the advance that British firms are making abroad. The chief records on the track and on the road are given up to October 12th, as well as a summary of the law relating to automobiles. Within the compass of nearly 300 pages this annual publication contains a mass of statistics and information which give it a place with Whitaker, Hazell, and other yearly additions to the bookshelf of the man who would be well informed.

A STRIKING proof of the utility of the motor-car for commercial purposes, and especially for newspaper distribution, is given in the "Eastern Daily Press." The proprietors have for some five years been running a motor-car daily, starting from Norwich about 2.30 a.m. to Lynn and back with supplies of their paper, which by these means has been placed on the breakfast tables of readers in more than a hundred towns and villages in West Norfolk. At the start there were a few troubles due partly to inexperience; but these were soon overcome, and the record for the present year is a remarkable one. Between January 3rd to November 30th the Siddeley car which is being used travelled more than 25,000 miles, and out of a possible 284 it made no less than 275 successful journeys. On six out of the nine occasions on which failure or partial failure occurred there was a dense fog, twice there were tyre troubles, and on one occasion a chain failed. From February 13th till October 8th—eight months—the record was absolutely clean. The history of the period may be conveniently summarised as follows:—Maximum number of days, 284; every rail and mail connection made, 275; percentage of successful journeys, 96.83; service wholly failed through fog, 3; partial failure due to fog, 3; partial failure due to tyres, 2; partial failure due to machinery, 1. Such a record, besides speaking well both for the quality of the car and its driver, affords convincing proof of the utility and practicability of the motor for commercial purposes.

PEKIN TO PARIS.*

It is a truism to observe that the telegraph and the telephone have destroyed the journalistic "scoop" as completely as the steamship and the train upset old-time notions of the personal triumphs of ambassadors and diplomatists. Everyone is able to communicate so quickly and readily with other people that the daring and venturesome exploits of the journalists of the early Victorian days are no longer possible, and those who make it a regular, we had almost written weekly, custom to extol their

At the Telegraph Station of Udde: The Prince is shown the way to Tserin.

records of passing events that are accessible to all in common, are almost forgetful of the ordinary conditions of modern life. For awhile the motor-car has revived the opportunities of the past, and there are still unexplored parts of the world yet available for the motorist to traverse. One of these regions was discovered in the Pekin to Paris run of last summer, when a prince and a penman astonished the Mongolian, startled the Siberian, impressed the Russian with awe, and greatly excited the Italian nation. It was a hazardous enterprise, and, apart from the automobile demonstration, has given the world a book that is readable in a greater degree than most books that tell the tale of travel in distant lands. Prince Borghese's journey will remain in the annals of the international motoring movement as an event of some importance, ranking with races and trials in which more have participated but in which the personal hardships have been less. The story as told by his companion on the motor-car, Signor Barzini, is a frank record of their doings, bearing upon it a touch of candour that adds to the zest with which the reader follows the *voyageurs* over desert and prairie alike.

It was early in the year that the author had instructions to meet the Prince at Pekin on June 1st. The car was a 40-h.p. Itala; others to start on the journey were a 6-h.p. Contal tricycle, two 10-h.p. De Dions, and a 15-h.p. Spyker. The departure from the "dim languor" of Pekin was a great event. "A large old Chinese cannon has decked itself out with flags and garlands. The band plays military marches. The great moment has arrived. Drivers and chauffeurs join their cars. The flag descends. A great bursting of petards and squibs; and amid these war sounds we move. We are off! And over the road lined by the Chinese soldiery, between two hedges of silent people, our

five motor-cars alone remain, pursuing each other through the capital of the Chinese Empire at a speed which it has never known before." And then they went forth into the strange land of China; the tricycle was soon in difficulties; the cars got over them. At length they perceived a tremulous line bordering the crests of the mountains far in the distance. It was the Great Wall of China, which is thus described:—

Seen from the distance, the Great Wall, blending and fusing with the outlines of mountains like a prodigious architectural moulding on their crests and sides, does not look like the work of man; it is too vast; and yet what can be seen of it from any given point represents only about one-thousandth part of its extent. The thing seems a fantastic freak on earth, thrown up by some great unknown natural force; the outcome of a cataclysm, not destructive but creative. As we approached, the Great Wall became more and more completely hidden by a crowd of peaks; and we only saw it again at the last turning of the road when we were about to enter under its heavy double gateways, covered by still available bastions. The road near to the top is now no more than a channel in the living rock, and it is increasingly steep and difficult. We had been walking for eight hours under an unbroken sheet of rain. We advanced slowly, painfully, and had to stop every minute to put stones out of the way, to make room for the wheels, to protect the car's flywheel from the projecting upward points on the roadway. All around us was gloomy and barren. We were coasting a deep ravine; suddenly, rising from its depth and resting on their isolators, two telegraph wires came in sight, crossing our road and the Great Wall. It was like the sight of familiar faces; these were friends to us, and would carry our news to the world outside. Poor ancient wall, the labour and pride of three royal dynasties, and of some millions of men; it is not by the cannon alone that thou art rendered useless; a thread of wire suffices. The most distant peoples can quietly commune with one another above thy head, ignoring thy very existence!

Their journey through the villages produced a succession of panics. The natives must have thought the Evil Eye was upon them. Barely clad children fled in terror at their approach; men and women talk about the monster to this day, and wonder if it was the railway. When the car stopped some would go near the car and ask "Where is the beast?" Others showed that "it drinks water through a hole." One curious impression of the travellers was that they did not trouble to know the time along the great valleys of China. "We lived outside of time,

Among the Mongolians: Camel and Car.

and this sensation of endlessness accustoms the heart and makes one grow resigned."

But the road was worse than any so far traversed. We had to fight, not so much against the difficulties of long, steep climbs, like those on the Lian-ya-miao Mountain, as against the obstacles opposed to us by the naked granite. We were advancing over rocks full of holes and bumps, of crevices and sharp points. The flowing of the

* "Pekin to Paris by Motor-car." By L. Barzini. London. L. Grant Richards. 1907.

water, the hoofs of the mules, and the large feet of the camels had barely softened in so many centuries the worst jaggedness of the narrow path. The car, however, cautiously and slowly proceeded, swayed on the unevenness of the ground; it had now one wheel now another caught between the stones, it slipped down with hard jolts from the jutting points of the road, it got the rims of its wheels gripped in deep depressions. And we listened anxiously to the metallic creaking of the chassis strained by the continuous pulling, to the slight wheezing of the wood of the wheels, to countless perceptible sounds coming from we knew not what part of the machine, faint moans of the steel that seemed to come from the work of destructive insects. All the joints

At Kalgan.

The cars in the Courtyard of the Russo-Chinese Bank; to the left the Contal tricycle; in the middle the Spyker, and to the right the two De Dions.

of the motor-car were undergoing a strain for which they were not meant, and those sounds witnessed to infinitesimally small misplacements, tiny deviations which might, however, prove the beginning of some disastrous damage. It was the skeleton of the machine suffering and expressing its fatigue; and the fatigue of a machine is not to be cured by rest. There were moments when every step presented a new problem. Etore (the chauffeur) steered standing, in order the better to see the road near the wheels. His hands were hurt by the strong vibrations of the wheel, which would not answer to the action of his arm."

And thus for many a mile they struggled on until "we found ourselves upon the rounded dunes, following roads traced over the sand by the long-continued passing of the caravan; and from up there we saw spreading before us like an ocean, blue and dim against the limpid horizon, the Mongol tableland. There great prairies and the desert awaited us. There lay flight, freedom, a way to the west." A few years ago none would have risked themselves without a guide over the Mongolian prairies; now there are telegraph poles along the camel road which seem to give an element of security even in the endless solitude of Central Asia. At length there was a break in the quietness.

"We heard a great sound of voices. A cry had rung across the city like a flash of lightning from the bridge over the Ta-ho to the Russo-Chinese Bank, 'They are coming!' It heralded the arrival of our French friends, who were entering at that moment into the city. We went to meet them in a festive spirit. We shook hands; we greeted one another; we told one another our difficulties. They had spent the night encamped at thirty li from Kalgan. Their journey, too, had been difficult, but it had also been pleasantly interrupted by the various occupations of camp life; the improvised cooking of meals in the open air, the fighting against the rain, the awakening in the coolness of the dawn. Under the Lian-ya-miao they had found the Hun not too swollen to be forded, and they had been able to avoid the picturesque and detestable ascent which we had had to make. But they had had no means of avoiding the other climbs, which were still harder and more difficult. In a moment the courtyard of the Bank seemed transformed into a workshop. Everywhere lay cans of oil and of fuel; screw-wrenches, hammers, tyres, spare pieces thrown about in confusion. The cars exposed their shining mechanism to the eye through their open sides, and they gave themselves up meekly to the performance of their toilette. The chauffeurs, their hands covered with grease, disappeared

between the wheels, and spread themselves at full length under the cars. They turned levers, unscrewed nuts, hammered away, cleaned everything. All unnecessary parts were discarded and thrown away in order to lighten the machine. Pons was sawing his mudguards, Bizac was doing away with the silencers; then the motors were tested, listened to tested again, and the courtyard was filled with noise, smoke and fumes. By the evening all the cars were ready. To the luggage had been added some goatskin wraps, which Pietro had bought for us in the marketplace. The farewell banquet, hospitably given to us by our host, M. Dorliac, was a melancholy affair. We were tired, and had nothing to say to one another, because our minds were all filled with the same thought, and our hearts harboured the same impatience. We were about to leave Kalgan, and with it all contact with civilisation.

Camping in Mongolia had its pleasures of uniqueness and its disadvantages in actuality. For considerations of practical concern as well as the propitiation of the natives, many of the provisions that had been carried were early jettisoned to some who helped, while the mudguards were sacrificed for a pail of water and a pickaxe exchanged for eggs. Altogether a system of barter was arranged which delighted the Mongolians and assisted the foreigners. Efforts such as that lightened the car and enabled a speed equivalent to the British legal limit to be obtained as far as Tong-kiong, in the Gobi desert, where a telegraph office was found. It had been established six years, and sent off its first message to the outer world on the day the motorists arrived. The nearest town is at Kalgan, 200 miles away. Urga is 500 miles. Before the telegraph clerk can reach the haunts of men he has to travel for a week from well to well. He merely transmits the messages from St. Petersburg, London and Tokio. For six years no telegram had been sent off from that station, which had been established because the distances were too great and there is need of these intermediate stages. From thence the intrepid motorists went across the Gobi desert; forded a tributary of the Iro with the assistance of Mongolians before reaching the Russian frontier; enjoyed the hospitality of Siberia—the first halt there being at Kiahhta, a village of millionaires living in little timber houses who might have a palace in Moscow or in St. Petersburg if they so wished.

The journey through Siberia is described with a graphic pen and the travellers' impressions of Russia are as interesting as any other portion of the volume of over 600 pages—one of the

Crossing a Bridge over the Hun-Ho.

most exciting books of travel published] this century. Photographs, some of which we are able to reproduce by courtesy of the publisher, Mr. L. Grant Richards, increase the interest of the book. The ending is characteristic of the dramatic note.

Taken all in all, "Pekin to Paris" is one of the best books descriptive of a motor journey we have read—not only for the unique story that is told, but for the delightful way it is related.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

SOME USEFUL SEASONABLE HINTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—During Christmas time there will be an enormous amount of motoring and using of motor-cars. There are one or two points to the credit of the motor-car that are well worth keeping in mind, and the most important of these is the fact that a modern car weighing complete with passengers one ton can transport five people at a cost of a shade under 1½d. for each mile covered. The cost per mile, on the other hand, of a first class railway journey works out at nearly 9d. per mile for five people, and this cost, although being more than four times as much as that of the motor-car journey, does not offer the extraordinary convenience of the latter form of transport, which is, after all, tantamount to employing special trains to go where you wish. One needs to work out these figures to thoroughly appreciate how great the financial advantage is in favour of motor-cars.

Take the original cost of a car as £700, and allow for depreciation at the rate of 25 per cent. per annum for four years, and assuming that the car has been run 10,000 miles in the year, then even when allowing the enormous sum for depreciation such depreciation adds less than 2d. per mile to the cost of running; this then brings up the cost of motor-car

time under altered conditions. The temperature of water standing in the open at the time these tests were made was 37 deg. Fahrenheit, but the comparison given shows very clearly the number of hours during which heat can be retained in the engine and radiator, and freezing obviated if the bonnet and radiator be properly covered up. Trusting these hints may be useful for Christmas.—Yours truly,

S. F. EDGE.

MOTOR-CAR THIEVES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would you kindly warn all proprietors of motor garages and those dealing in accessories against buying from strangers odd tyres, lamps, &c. I have during the last few weeks heard of four separate thefts which appear to be the work of some gang operating in London. In the first case a Stepney wheel with tyre was cut from a taxicab; in the second case a spare tube was taken out of the back of a car; in the third case a spare cover in a waterproof case was cut from a doctor's car while standing outside his house; and the fourth case, which has the merit of having a humorous side, was the clever theft of a large acetylene head light. A car was standing outside a house at night and

The Navy Employment Agency Motor and Training School at Portsmouth.—Lieut. Dains, R.N., and his staff together with some of the men who have passed through the course of instruction. [Silk, Portsmouth.]

travel to half that of a corresponding number of train journeys, and in the latter case a very considerable further sum must be allowed for conveyances at each end of the railway journey. I think it may safely be said to-day, when calculating on this basis, that the motor-car is the cheapest form of conveyance.

A most important point to bear in mind during the festive season is the number of social gatherings at which many motor-cars are sure to be collected after bringing the guests; there will certainly be a lack of accommodation, and many of these cars will have to be left out in the open, probably in frosty weather. It is well worth remembering that the addition of 20 per cent. of common commercial glycerine to the circulating water will prevent the freezing of this save under most exceptional circumstances. Another point should be remembered if it is desired to keep the engine at a reasonable temperature and to keep the water from freezing when the car is left in an exposed place, and this is to cover the engine bonnet and radiator with a large rug. I have had some tests made with a six-cylinder Napier to ascertain the exact advantage of covering up the radiator and bonnet. The tests were as follows:—The water in the radiator was raised to a temperature of 165 deg. Fahrenheit by running the engine, and then the radiator and bonnet were covered with a rug and the car was left standing three hours, at the end of which time the temperature of the water was again taken and was found to have only lost 8 degrees of heat—that is, the water remained at 157 degrees. During the same period of time when the car had been left uncovered by a rug, the water had already fallen to 112 degrees, showing a loss of 53 degrees of heat in a corresponding

a stranger informed the chauffeur that his tail lamp was out. The chauffeur, cordially thanking the stranger for the information, went to the back of the car, and proceeded to light the tail lamp. While thus engaged the thief calmly took off the large valuable headlight and disappeared. It is reasonable to suppose that these thefts are connected with one another, and no doubt there are dozens of the same sort, of which I have not heard. They would appear to be the work of a gang, presumably using a cab or some other means of conveyance to quickly remove the stolen goods. If all dealers in motor accessories would refuse to buy from unknown people the motive for the robberies would disappear.—Yours truly,

J. E. HUTTON.

MOTOR-CAR AMONG HOUNDS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—On the evening of Wednesday, December 18th, about 6.20, as the Craven Hounds were being brought home to the Walcot Kennels, Hungerford, after hunting, a motor-car dashed through the pack at a point on the Bath road between Benham cross-roads and the Half Way Inn, killing one bound and crippling three others. No hooter was sounded, and no sort of warning was given to those in attendance of the approach of the car, which came up from behind, travelling at a tremendous pace. The driver made no attempt to stop, although he must have known that he had run through the middle of the pack. We had scarcely time to get the hounds to one side of the road before

another car was upon us. I and the second whip rode back towards it, shouted, and held up our arms to signal to the driver to stop, but it was no use. On the fiend tore, and had hounds not been close into the fence he would have been over the top of them as well. I may add that there were four of us in pink coats with hounds. The night was fine, no rain or fog, and the light was quite good enough to distinguish one hound from another, so that this dastardly behaviour cannot for one moment be looked upon as an accident.

I will be grateful if you will find room in your columns for this letter, in hopes that some clue may be forthcoming which will establish the identity of the offenders.—Yours truly,

W. J. YORKE SCARLETT.
Master of Craven Hounds.

MOTOR-CAB ACCIDENT.—DRIVER WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It has been reported to the Motor Union that the driver of a motor-cab collided with a cyclist at the corner of Park Street, in Oxford Street, on October 17th last. It is alleged that the driver, instead of stopping to see whether the cyclist was hurt or had suffered damage, put on speed and drove away down Park Street.

The Motor Union, in order to emphasise its condemnation of the driver of any vehicle who fails to stop when involved in an accident (whether he is responsible for such accident or not), is prepared to pay

The 40-h.p. Crossley Limousine supplied by Messrs. Jarrott and Letts to the Marquis of Northampton for the use of H.R.H. the Prince and Princess of Wales during their stay at Castle Ashby.

a reward of £5 to any person who will give such information as will lead to the identification of the driver of the motor-cab in question. Yours

W. REES JEFFREYS (Secretary).

LOW TENSION MAGNETO TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing in the last number of the *M.C.J.* a query by a correspondent who signs himself "Frank" in regard to a magneto trouble on a Richard-Brasier car, I would like, with your kind permission, to offer a probable solution. I had exactly the same trouble myself and it took some time to find the cause. It was No. 1 cylinder in my case that would not fire, and ultimately I found that the trip rod on No. 3 was just making contact when No. 1 should be firing, thereby causing the current to short, which would be the quickest path to earth, and yet we could get each cylinder to fire separately. I could write more on the cause, &c., but think the above will answer the purpose.—Hoping this will prove useful, I remain, yours truly,

E. T. WATTS

THE DESIGN OF INDUCTION PIPES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in the article on the above subject in a recent issue of the *M.C.J.* At first sight the arrangement of an inlet pipe appears to be a simple problem, but one of the most difficult matters in multi-cylinder motor construction is to supply all the cylinders with a uniform quality and quantity of mixture. The difficulty lies in the desirability if not necessity of using a single carburettor, for a number of cylinders. Air is wonderfully elastic and appears to resent being battered about from pillar to post—from one cylinder to another. Take the T-shaped pipe as used on many four-

cylinder engines. The rule for firing is to start, say, at No. 1, jump to No. 3, next to No. 4, then return to No. 2. Now when the motor is running at, say, 1,200 revolutions and No. 1 draws in a charge the gas reaches a speed approximately of sixty miles an hour towards the front of the motor through the forward branch of the T. No. 3 follows and finds it necessary not only to start the gas at this rate in the opposite direction towards the rear of the motor, but to overcome the impact of the gases going towards No. 1. By the time No. 3 has got the mixture well started in its direction its inlet valve has closed, less than one-fortieth of a second having elapsed. The inlet in cylinder No. 4 opens just in time to receive the gases accelerated by No. 3, and together with its natural suction is well filled. No. 2 then opens and meets with the same resistance from No. 4 that No. 3 met with from No. 1. The result is both No. 2 and No. 3 are partially starved. Their explosions are weaker at high speed than those of the end cylinders. In order to get them to fire at all the carburettor is called upon to furnish a richer mixture than is necessary or advantageous for No. 2 and No. 4. This not only lowers the efficiency of the motor but causes it to consume more fuel than if all cylinders were supplied with a uniform charge. The engine balance is also affected by the lack of uniformity of power developed by the various cylinders. There are a few manufacturers who have endeavoured to overcome this unevenness through various devices and constructions, the description of which is somewhat out of my province. It is satisfactory, however, to find that designers are realising more and more the necessity of uniformity in this direction.—Yours truly,

W. T. DUTTON.

AN OPTICAL ILLUSION?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR—I have often noticed the momentary hesitation in the running of motor-car and bus wheels, but, taking it for granted that everyone knew all about it, I never troubled to comment upon the matter. It, however, is interesting. I cannot imagine the two diametrically opposite spokes of any wheel being a lever of "the second order," as, although the ground is the fulcrum, the power is applied at the centre and not from the top of the wheel, which would make it a lever of second order. I am of opinion that this hesitation in the revolutions of the wheels actually occurs, but not in the manner described in a recent issue, where mention is made that the top spokes are travelling faster than the bottom ones. I have heard this before and I do not agree with it. The top of the tyre travels faster than the bottom owing to the weight deflection of the lower portion.

The effect is due, I believe, to an uneven torque, the contour of the road and the slight lateral swaying of the car contributing to a small but evident action of the differential gear, which is magnified by the spokes of the wheel. It is peculiar that this is not apparent in horse-drawn vehicles, nor even in a car when it is rolling along. But a real optical illusion may be witnessed if you stand well behind some ordinary vertical railings and look through them; it will be observed that when a car is running forward all the wheels will appear to be going backwards in the most uniform manner, and an eerie skidding feeling creeps over you if you happen to see it quickly without looking for it.—Yours truly,

HERBERT J. CHAPMAN.

AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be very pleased if you could tell me the reason why petrol is pumped into the cylinders of my 10-h.p. Brooke car. The spirit is forced to the carburettor by an air pump operated by foot pedal. I find that I get no air to mix with it. Do you think it would be the needle valve which is worn out, as, when I start pumping, the petrol passes the valve if I hold it down tight.—Yours truly,

CHARLES HART.

[This car, which should be described as a 12-h.p. Brooke car, is an old model, not made by the firm since 1904, and has three cylinders. Messrs Brooke and Co., Ltd., have always favoured pressure feed to the petrol, but whereas in the old model possessed by our correspondent the pressure was kept up by an air pump connected to the accelerator pedal, so that each time this pedal was pressed a certain amount of air was pumped to the petrol tank, a safety valve being fitted to prevent excess of pressure, in the present Brooke cars the pressure is kept up from the exhaust in the same manner as adopted by other makers. The air-pump system worked very well, but as the plunger of the pump was over 2 in. diameter, it required occasional attention, which was more than some customers were disposed to give. We think our querist's trouble is due, as he suggests, to some fault in the needle valve, as, of course, petrol should not be able to pass by when it is held down. It is possible, also, that the safety valve is stuck up, or set at too great a pressure. We should also advise having the air-pump itself thoroughly overhauled.]

RELIABILITY OF MAGNETOS.—"A. W. R." writes:—"I should be glad if those motorists using magneto ignition, either high or low-tension, would give their experience of the same, and state the longest distance they have run without it being necessary to adjust the machines in any way."

A GUIDE TO MOTOR-CAR BODIES.

THE range of car bodies has been so greatly extended during the last few years that the accompanying illustrations will be of value and interest. The types represented in the sketches are very complete, covering practically the whole range of coach building design for motor-cars. It will be interesting to review these individually, noting the points with regard to each type.

The designs are French, embodying the styles of the most notable Parisian builders.

1. This is a two-seater or racing type, suitable for testing purposes, or is preferred for general use by many motorists who desire to keep their cars exclusively for their own use, and not to entertain their friends. It is built very lightly and is so constructed that the panels of the seats are made with a wire mesh, every point to ensure extreme lightness being considered. A small extra seat for mechanic's use is shown at the back; this is of such a nature that it can be completely collapsed and made to retire into the rear back box or tool and tyre carrying space.

2. This sketch represents a more elaborate and graceful design with the same ends in view; the rear seat in this case is more of a permanent fixture, inasmuch as it does not fold into the locker.

3. An ordinary tonneau with back entrance, or it can be arranged so that the front seat should swing or revolve to allow of ingress to the car.

4. Here is a small Victoria type body to seat two, fitted with a folding hood, either leather or canvas covered, with a glass screen to the front, arranged so that the top of the hood should meet the screen. This is a type very much in favour amongst country doctors, providing as it does a carriage neat and high class in appearance, yet light on tyres, and not necessitating a large horse-power and petrol consumption, thus keeping the cost of upkeep at a price within the limits of the daily use of a country medico.

5. Is an enclosed coupe, which allows for being driven from the inside, and is fitted with an extra seat for mechanic's or personal use. This also is a type very much in favour by doctors.

6. Represents a more elaborate design with the same end in view. It will be seen that the steering wheel and lubricator are entirely cased in; no particular object is achieved here except that of novelty in design and appearance.

7. Represents a single landaulet with the front cased in in the same manner.

8. Is a completely enclosed coupe, which allows of driving from inside.

9. Here we have a novel design of a double coupe, with the front completely enclosed. The lines of this are carried out in the style of an old posting coach, which is a design that lends itself to a very graceful appearance, taking away the rigidity of straight lines, which, in a covered body on a similar car, tend to destroy the harmonious appearance of the whole.

It will be seen that other types are similarly protected in the front; this arrangement is more in vogue across the water than here, the *raison d'être* is that it allows the owner of the car to drive or occupy the front seats without loss of dignity, and also to be completely sheltered from the weather.

10. Is a variation on these lines, the rear part being made in landaulet style.

11. This embodies the same idea, the rear of the carriage being expressly designed for long touring purposes in sunny climates.

12. Here we again return to a small park or town type, this being practically a Victoria. The usual objection to a Victoria type body,

namely, that the occupants of the back of the car suffer from an extreme draught blowing in behind the driving seats, has been overcome by the substitution of wind doors as indicated by the dotted lines.

13. We again have a graceful phaeton with side-entrance, otherwise similar design to No. 3.

14. This shows the ever popular Roi des Belges, fitted with a hood to the rear. This type is again shown in No. 16, with the rear hood up, and an extension blind or curtain is carried from the front of the rear hood to the top of the glass screen in front of the driver. This is a very convenient method of protecting the front seat but has a strong objection against it in regard to appearance.

15. This is a Victoria type of side-entrance body.

17. Indicates the Roi des Belges type phaeton fitted with a useful double extension hood.

18. Is an extended type of the same body made to seat two extra persons, a folding or collapsing armchair being placed forward of the rear seats.

19. Is a type that may be aptly described as a "triple phaeton," seating seven persons including driver; the extra inside seats in this case are not of a collapsible or folding form, but are built in as part of the original construction of the body. To obtain this effect a very long chassis is necessary, and the side entrance door has to be limited in size. On the other hand, a very comfortable seating space is arrived at for the extra passengers.

20. Here we have a handsome phaeton of Roi des Belges design, fitted with a canopy. This canopy has a large panel at the rear, brought round the elbow, practically converting the car into a semi-limousine; in fact, this type of body is frequently described in this manner.

21. Is a variation of the same, the rear panel being of cab shape.

22. Is a type that is very rare, and not likely to be in great demand; in fact, probably this design was created to the special requirements or pattern of one particular customer. It will be seen that the occupants of the rear or end part of the car are able to sit vis-a-vis in the same style as a landau. This again requires good length of chassis.

23. Is a limousine with removable sides. This type of body allows great range of possibility in regard to the manner of usage, combining as it does a canopied car, a semi-limousine and a full limousine. It should be very carefully constructed in order to obviate rattling owing to the numerous movable parts involved.

No 24. Is a single landaulet of a standard type, made to entirely fold down to enable the car to be used as a closed town carriage or a country vehicle.

25. Is a double landaulet the front of which is fixed, extra seats being arranged in the space between the driver's seat and the side door.

26. Illustrates a limousine landaulet. This design of carriage came into vogue about three years ago, since when it has gained ever

39. Shows an enclosed coupé with an extra continuation to back for luggage and servants, very suitable for long touring where the owner of the car wishes to carry a retinue of personal attendants conveniently.

40. Gives a large station or estate omnibus.

41 and 42. Are respectively coupe and landaulet types for electric vehicles, being purely town carriages.

THE STORAGE OF PETROL.

THE Gainsborough magistrates were occupied on the 17th inst. in hearing a charge against Edwin Baines, motor-car manufacturer, of obstructing Superintendent Wilkinson, the Gainsborough Council's Inspector under the Petroleum Act, in the execution of his duty. It was stated that Superintendent Wilkinson had seized 200 gallons of petrol, which the British Petroleum Company, who had no licence, had deposited upon Mr. Baines's premises. He left it in a motor-shed upon the premises, and Mr. Baines, asking to be allowed to use the shed, was allowed to have the key. When, however, Superintendent Wilkinson went later to fetch the petrol away he was informed by Mr. Baines that it had been sold by him. Mr. Tweed, for the defendant, pleaded a denial of knowledge that the petrol had been seized. The Chairman (Mr

The Fleet of N.A.G. Delivery Vans belonging to the "Kaufhaus des Westens," one of the large general supply stores in Berlin.

increasing popularity amongst motorists, especially in this country, its advantage being that it enables a large and commodious carriage to be built in the limousine style, and yet can be easily equipped and converted to a completely open carriage.

27. Shows a single-landaulet with an arrangement at the back for seating a servant.

No. 28. Is a cab type, carried out on the familiar lines of a London hansom.

29. Shows a smart coupé, a type of carriage which, while not greatly used for motor-car work, yet has many advantages, particularly lending itself to a smart and neat appearance; in fact, it is from this type of body that the limousine has been evolved, the limousine being practically nothing more or less than a large coupé.

30, 31, 33, 34, 35, and 36. We have variations of the limousine. This vehicle is coming more and more into daily use amongst motorists, especially on the Continent. It is one that lends itself admirably to luxurious equipment and fitting, while the occupants are well protected from the weather. It is true that it is always closed, but if made with large windows, which in their turn are made to open, almost the same advantages are gained as with a canopied car, with the advantage of greater comfort and equipment.

32. Is a cab type made to seat four.

37. We have a further variation of the phaeton.

38. Represents a "Berline"—a very unusual type of body, it being carried out on the lines of a stage coach.

Embleton Fox) said the magistrates fined the defendant £10, including costs.

The British Petroleum Company were charged at the instance of the Urban Council with storing fifty gallons of petrol upon Mr. Baines's premises without holding the licence necessary under the Petroleum Act of 1871. The point at issue was whether the licence held by Mr. Baines covered the defendant company. Mr. Dwyer's contention on behalf of the company was that Mr. Baines was not prohibited under the Act from storing for other people, provided the premises were licensed, and the quantity stored was not greater than stipulated. The Chairman (Mr. Embleton Fox) asked if the point had ever been settled, and Mr. Dwyer replied in the negative. The Chairman said the Bench were against Mr. Dwyer, and they should find that the company did occupy the premises without having a licence, and consequently they would have to inflict a fine. They would, however, go into the matter very thoroughly, and would give their judgment in January, and would also state a case if Mr. Dwyer asked for it.

MESSRS. CLEMENT-TALBOT, LTD., have been awarded by the jury of the New Zealand International Exhibition a special diploma in addition to the ordinary gold medal for the excellent collective exhibit of Talbot cars. When it is stated that this is the highest award that can possibly be obtained in any one section, the merits of these popular cars will be readily appreciated.

SOME NOTES ON SKIDDING.

In motor parlance the carburettor has truly been called the heart of the car, but the tyres are in reality the foundation of automobile success and perfection, and play as important a part in the complete machine as the engine itself. It is on the foundation of the tyres that the pleasures and troubles of motoring rest, and on the tyres also depend the safety and the lives of all who drive high-powered cars. Carrying the weight of the vehicle, cushioning all the shocks from rough and uneven roads, bearing the wear and tear incident to travel, and at the same time applying the power transmitted by the motor and giving the car its life—the tyres play a most important part in the successful automobile.

Since the birth of the industry tyre troubles have been the bugbear of motor touring; but even more troublesome and dangerous than these has been the side slip or skidding that has caused no end of collisions and accidents, and has in many cases resulted in injury to the machine and its occupants. When the terrific strains to be met with are considered it is little short of wonderful that the "wind bags" of rubber and canvas can perform the great task imposed upon them. But all these difficulties have been overcome, and tyre manufacturers to-day are bending their thoughts to the question of the prevention of skidding and side slip.

In large cities, particularly where the water-cart turns the dust of the roads into a mass of slippery mud, skidding becomes most dangerous. Every driver of an automobile has experienced the sensation, has felt his car fail to respond to the brakes as the rear wheels locked and slid along over the muddy pavement; has felt the machine swerve to right or left, and oftentimes turn completely around, entirely out of his control, a wild thing for the time being, and he has been helpless to

An interesting form of non-skid and anti-slipping tread consists of a rubber tread, moulded with round rubber studs projecting from it at close intervals. It is claimed for this tyre that the studs render the tread free from side slips under all conditions and increase the tractive power on muddy and slippery roads. It is asserted that the tyre is to a great extent immune from punctures, and that the studs of rubber have a cushioning effect and make the car ride easier. Many experiments have been made with metal plates imbedded in the rubber of the tyres, but these have not met with much success. One of the greatest objections is that they are more destructive to the rubber than the road is, and that the immunity from punctures and skids afforded is more than outweighed by the other disadvantages. Another and rather popular form of non-skid device is that of ordinary chains so arranged as to fasten over the rear tyres at intervals of about 6 in. These give greater tractive force, and also prevent the rear wheels from skidding. In deep mud they are invaluable. They are easily attached and taken off the wheels, and are arranged with the under part of the chain flattened so that they are not destructive to the rubber of the covers. The main objection to these is that they break at times and are likely to be thrown into the driving chains or machinery, revolve and cause trouble there. There are a great many steel and leather coats of mail on the market, both of the detachable and vulcanized tyres. It rests largely with the driver of a car to decide which most nearly meets his needs. Generally speaking, a tyre fitted with a detachable non-skid cover or device is the more desirable for use on long tours, for the reason that it can be conveniently carried and adjusted when occasion demands, and will give correspondingly longer service without depriving the owner of the car of the pleasure of riding on real rubber next the roads.

To the drivers of automobiles generally it is timely to state that the

Two of the Motor-Lorries used in the recent Military Manœuvres in Italy.

stop it. Let the car under good headway begin to skid, either on city streets, country roads, or hills slippery with mud, and there is any amount of trouble ahead. Collisions, overturning, and even death may result, and the driver is powerless to avert the calamity. The machine is in every sense of the word a runaway, and there is nothing to do but sit still and wait, hoping for the best.

It is with a realization of this fact that tyre manufacturers have gone ahead to invent non-skid appliances, and a large number of such devices are now on the market. Pre-eminent among the non-skid devices that have become popular is a leather tyre which is claimed to be non-skidding and puncture-proof. This tyre consists of a heavy leather cover vulcanized on the outside of an ordinary outer cover. Within this there is an intermediate course of leather, and on the top of the whole a heavy leather tread thickly studded with short steel studs. These in slippery weather give an additional traction, and, it is claimed, cut through the light top coating of mud on the roads and get a firm grip, thus preventing side slip or skidding, as well as the consequent loss of power. There are also ordinary leather covers studded with steel non-skid studs, the entire cover being fastened over the rubber tyre with a patent device which makes it easily detachable. The idea is that the non-skid cover may be used in wet weather and removed on fair days, as many claim that the steel tread tyres take more power to drive and also deprive the rubber tyre of its resiliency.

In the use of tyres of this sort the question as to whether it is better to equip both rear wheels with the non-skids, or one rear wheel and one front wheel on opposite sides of the car is a debatable one. Many drivers follow this latter course, claiming that in many cases upon attempting to turn corners on slippery asphalt the front wheels have skidded and the car had become unmanageable, despite the fact that the non-skid tyres on the rear wheels were holding. In this case, however, they simply acted as a brake. Some few cars are equipped with non-skid tyres on all four wheels, but there is, remarks Mr. H. B. Haines, a well-known authority, no particular advantage in this.

question of skidding is one not to be allowed to go unconsidered. Every part of a car may be in good condition, but if the tyres skid when the machine is travelling at high speed the results may be extremely serious. To the driver who finds his car skidding and beyond his control there are very few suggestions to be made. "The best thing to do" in all probability would not be the same in any two cases. The road conditions, the contour of the country, and the conditions of traffic would all alter cases. The ordinary small skid on a slippery road may be overcome by turning the steering wheels in the opposite direction from that which the back wheels are trying to follow, and then, as the car straightens up and starts to skid the other way, to swing them back again, and so continue until the machine steadies. Apart from the skids which sometimes occur in descending a steep hill on muddy roads, those most often met with occur on the city streets after a rain storm of short duration or the passage of a sprinkling cart. The skid is usually met with in attempting to turn a corner or when the brakes are applied. What its results will be cannot be foretold. In most cases it is more advisable to take a close chance in slipping past the various vehicles encountered than to take the risk of applying the brakes hard on slippery roads. A skid may be prevented by applying the brakes quickly and then releasing them and applying them again, overcoming each small skid with the steering wheels. The best method is to go straight ahead as far as possible, gradually slackening the speed of the car and avoiding sharp swerves right or left or turning corners. Ordinarily the car will not skid, even at high speed, on a slippery road as long as a straight course is followed, but the moment a turn is encountered or the brakes are applied the trouble begins.

NAZZARO, the well-known driver of Fiat racing cars, has written to the Coventry Chain Company stating that since 1905 he has always made use of the Coventry chain for racing as well as for touring, and that he has never experienced the slightest inconvenience or mishap.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE agreement between the R.A.C. and the M.U. having been determined the Club has forwarded a scheme of association to the provincial clubs and kindred institutions for their consideration. Suggestions for the improvement of the scheme are invited. All such suggestions will be taken into consideration at the next meeting of the General Committee of the R.A.C., on which committee all the associated bodies will have representation in accordance with their numerical strength.

Should this scheme meet with approval, the intention is, as far as possible, to decentralise, with the object of throwing more responsibility for local work upon the provincial clubs.

THE R.A.C. AND M.U.

LAST week the terms of the separation between the Royal A.C. and the Motor Union were mutually agreed upon. The agreement will now cease on December 31st, the Club paying the Union £850 in respect of financial obligations from which the two organisations mutually release each other. A joint notice is to be issued to the affiliated clubs informing them that they are at liberty to cancel their affiliation any time before January 31st, 1908; but in the case of those clubs which do not cancel their existing affiliation agreement with either body, a joint notice will be issued in February terminating such agreement on the last day of 1908. The Club and Union will continue to discharge their respective duties and obligations to such affiliated clubs which decide not to interfere with their existing agreement during 1908.

The Club has decided upon a scheme for association by which associated clubs or institutions will pay an annual capitation fee of 5s. per member, or individual associates a subscription of one guinea per year.

One of the three Steam Motor Patrol Wagons recently supplied by the White Company to the Police Department of Rio de Janeiro, Brazil. The vehicles are built on the standard 30-h.p. chassis, the bodies, which are built in accordance with specifications furnished by the Brazilian Government, having accommodation for from thirteen to fifteen persons.

MOTOR UNION.

THE expenditure in connection with the legal and legislative fund of the Motor Union since the beginning of the year has been £428.

AFTER consultation with the Liverpool and Cheshire Motor Clubs the Motor Union is endeavouring to secure a Sunday service for the motor-car traffic across the Mersey. The Birkenhead Corporation maintain a seven days' passenger service and the motor traffic seems to demand recognition from the authorities.

AUTOMOBILE ASSOCIATION.

THE patrols of the A.A. were not on duty on Christmas Day, the committee having granted leave of absence to each man. They were, however, out in force on Boxing Day and saved many a victim of police traps.

The Earl of Donoughmore, the Hon. Mrs. Vivian, and Sir W. H. Holland, Bart., were among the ninety-four members elected to the Automobile Association at the last meeting of the committee.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

At the last meeting of the Council of the Institution the following were elected members of the Institution:—Messrs. J. H. James (London), M. R. Lawrence (Crayford), G. D. Flather (Sheffield), D. H. Simpson (Manchester), F. R. Simms (London), A. C. Instone (London), Claude Crompton (Chelmsford)

THE AUTO-CYCLE UNION.

WITH regard to the Auto-Cycle Union, of which Mr. F. Straight is the secretary, and which has offices at 18, Down Street, Piccadilly, W., the following clubs are already affiliated:—Birmingham Motor Cycle; Black Prince Motor Cycle; Bocardo Motor Cycle; 'Bohemian Motor Cycle'; Brighton Cyclists; Bristol Bicycle and Motor; Cardiff Motor; Chatham and District Motor; Cheltenham and District Motor; Durham and District Motor Cycle; Essex Motor; Great Yarmouth and District Motor; Hartlepool and District Motor Cycle; Hull Auto Cycle; Lancashire Motor Cycle; Lewisham Automobile; Lincolnshire Motor Cycle; Manchester Motor; Motor Cycling; Newcastle and District Motor; North-West London Motor; Richmond and District Motor Cycle; Rotherham Automobile; Royal Albert Motor Cycle; Southend and District Motor; South-West Ham Rovers' Motor and Cycling; St. Helen's and District Motor Cycle; Stratford-on-Avon and District Motor Cycle; Walthamstow Motor; Western District Motor Cycle; West Essex Automobile; Wigan Wednesday Motor; and Woolwich, Plumstead, and District Motor.

BEDFORDSHIRE.

SUPPLEMENTING the report of the Bedfordshire A.C. in our last issue we may mention that it has 102 members out of 812 owners of cars registered in the county. Mr. E. W. Hart, of Luton, has been elected on the committee. At the annual dinner Mr. Percy Barlow, M.P., said he did not believe in the speed limit. Mr. W. H. Leete, the County Surveyor, showed a sample of dustless road taken from the Clapham road and observed the cost of that was not more than ordinary macadam, though it had a much longer life. He further said that the County Council Highways Committee had authorised him, where owners would not cut down hedges that obscured the view, to do so, and he was doing it where necessary.

BRADFORD.

THERE were about forty members of the Bradford A.C. at the Great Northern Victoria Hotel, Bradford, recently, when Professor Charnock, of the Bradford Technical College, gave an interesting lecture on magneto ignition. Mr. G. H. Kent presided.

Commencing with some of the classical experiments in induction due to the celebrated Faraday, the lecturer led up to the principles underlying the construction of the ordinary induction coil, and proceeded to give examples of its application for the purpose of igniting the charge of a motor-car engine. Special reference was made to the new Lodge igniter, a specimen which had been given to the Technical College by Sir Oliver Lodge as a memento of his recent visit being shown by Professor Charnock. Its certainty of action was demonstrated by several experiments, a notable one being the complete immersion of the sparking plugs in water, as was done at the motor show in London. The troubles incidental to the storage of electricity in the ordinary accumulator were alluded to, and it was shown that the magneto machine presented a solution of the difficulty. Several experiments were given to illustrate the principle of the magneto, and a number of recent examples were shown at work. With one of these it was possible to start the machine from the dashboard without first putting the engine in motion, this being effected by a free-wheel device attached to the spindle of the magneto. The lecture was illustrated by a number of working models, blackboard sketches and limelight views, and at the close Professor Charnock was accorded a vote of thanks.

HUDDERSFIELD.

THE annual meeting of the Huddersfield branch of the Yorkshire Automobile Club was held at the George Hotel, Huddersfield, last week. Ald. W. H. Jessop (the president) presided.

Mr. E. Gordon Learoyd (hon. secretary) read the report and balance-sheet, which showed the membership now totalled 157, an increase of forty-two on last year. There was a balance in hand of £45.

The following officials were appointed for the ensuing year:—President, Ald. W. H. Jessop; vice-presidents, Messrs. F. W. Bentley, H. Broadbent, D. Stoner Crowther, A. Dawson, H. Dickinson, E. Hoyle, R. V. Middlemost, Charles Sykes, and W. E. Wimpenny; chairman of committees, Mr. Arthur Dawson; secretary and treasurer, Mr. E. Gordon Learoyd; auditors, Messrs. E. Lawton and J. D. Simpson; and representatives on Yorkshire Automobile Club Committee, Messrs. Fred. Sutcliffe and E. Gordon Learoyd.

MIDLAND.

THE seventh annual report of the Midland Automobile Club records the membership on October 31st at 272, and notes with pleasure that there has been no application during the year in any part of the Midland counties for special speed limits. The report gives a summary of the various club events during 1907, and draws the attention of the members to the fact that the club premises have been very little used during the year. The income from subscriptions shows an increase of £39 and a profit of £34 on the hill climb at Shelsley Walsh.

Mr. W. Ballin Hinde presided at the annual meeting, after which the members adjourned to dinner, at which nearly forty were present. An interesting discussion took place with regard to the fixtures and entertainments for the ensuing season.

WELSH.

The strength of the Welsh A.C. has been considerably increased during the year. The membership is now 137, and in the course of a few days will be still further increased. During 1907 the club was successful in inducing the Glamorganshire County Council to tar the Mumbles road, which work greatly benefited all users of this road, and was much appreciated by them.

The club has been presented with two valuable challenge cups, one by Capt. D. Hughes-Morgan and the other by Mr. F. Cory Yeo. The competitions were well supported by the members of the club.

A club room will be opened at the Tenby Hotel, Swansea, in the early part of the new year, at which refreshments will be obtainable and the various journals may be seen. Members of any affiliated motor clubs who may be touring in this district will be welcome visitors to the room, where they may be able to obtain the latest information as to the condition of the roads in the district. It is anticipated that during the course of the next year the club will open up new divisions in some of the outlying districts.

Competitions will be held, and it is probable that the reliability trial will be increased from one to three days.

The club has been successful in getting a number of crossings relaid and various improvements carried out to the roadways by various authorities.

DR. REID has been elected president of the Blackpool and District M.C.

MR. E. W. BISHOP, 18, St. John's Avenue, Harlesden, is taking steps to form a motor-cycle section of the Harlesden Cycling Club.

THE Burton-on-Trent M.C.C., of which Mr. A. W. Read, 119, Derby Street, Burton, is secretary, are holding a club run to Ashbourne on Boxing Day.

COMPANY NEWS.

AMELIORATED OIL COMPANY.—£50,000. Oil and petrol producers and refiners, dealers in benzol, alcohol, and spirits, &c. Two agreements between R. Wynne and B.W.P. Syndicate, Ltd. 10, Serjeants' Inn, E.C.

WHITE STAR TYRE AND RUBBER COMPANY.—£2,000.—To acquire the business of re-treading tyres recently carried on by J. O'Brien and Mrs. A. G. O'Brien at 26, Stephen Street, London, as Royal Standard Tyre and Rubber Company. 8, Bream's Buildings, E.C.

STOURBRIDGE WHEEL COMPANY.—This company has been registered with a capital of £2,500 to acquire the business of manufacturers of motor-car and other wheels carried on at 2, New Road, Stourbridge, and to carry on the business of manufacturers of and dealers in wheels, rims, and bodies for motor-cars, &c.

GEORGE ACE.—£5,000. Manufacturers, repairers, and vendors of motor-cars, &c. Agreements: (1) D. H. Morgan and (2) G. Ace and Mrs. A. Ace.

A CASE OF MANSLAUGHTER.

BEORE Mr. Justice Darling, at the Central Criminal Court, on the 18th, George Carpenter, a chauffeur, surrendered to his bail to answer an indictment charging him with the manslaughter of John Dear at Chiswick, on November 11th. Carpenter had been on duty at the Olympia Show and had to take the car home at night. He stopped at a public-house on the way, where he met two men named Dear and Barnes, and was persuaded to drive them to Brentford. The night was very foggy, and on the return journey near Gunnersbury Station the car ran into a market cart. Dear's skull was fractured and he died within a few minutes. Barnes was also seriously hurt, but subsequently recovered. Carpenter was practically unhurt. The jury, in finding him guilty, strongly recommended him to mercy. Mr. Justice Darling said in the circumstances he should pass a nominal sentence of eight days' imprisonment, to date from the commencement of the Sessions, which would involve his immediate discharge.

AUTOMOBILE ACCIDENTS.

CHARLES HILL, a Liverpool dentist, has died in the Bootle Hospital from injuries sustained in a motor-car accident. He and several friends were motoring from Liverpool to Southport, when he either fell or jumped from the car. When picked up he was unconscious.

WITHIN an hour on Sunday two motor-omnibus accidents occurred in London. A young woman was crossing the road at Whitehall when she was knocked down by a motor-omnibus and on being taken to the Westminster Hospital it was found she was dead. The other accident took place near the New Cut, where an elderly man was knocked down and taken to the hospital in a critical condition.

A SERIOUS accident occurred on Saturday at Westcliff-on-Sea to Mr. Maurice Natham, of Leigh-on-Sea, and a lady who was driving with him in his motor-car along the Leas. In trying to avoid a dog the car overturned upon its occupants. They were extricated, and Mr. Natham was taken to the hospital suffering from a dislocated shoulder and concussion of the brain. The lady was conveyed to her home in Leigh much bruised and cut about the face.

CASES UNDER THE MOTOR CAR ACT.

THE PRODUCTION OF LICENCES.

Sidney Mountair, of Buckingham Gate, S.W., has been summoned at Kingston for exceeding the ten-mile speed limit in Kingston and for failing to produce his licence. Mr. C. Piper, who appeared for the defendant, admitted that he had exceeded the limit, but it was under exceptional circumstances. The defendant was sent to London to bring down a doctor to his master at Molesley, who was ill, and he was naturally anxious to be as expeditious as he could. He was a man, however, who had a clean record. The Bench imposed a fine of £3 for exceeding the limit and of £1 for failing to produce the licence. Harry Percy Smith, of Fulham, was convicted of a similar offence at the same court, and as he did not attend the magistrates adjourned the summons for the production of the licence.

Theodore Allison, of Clapham Common, was summoned before the Wimbledon magistrates for driving a motor-car along Morden Road, Merton, on November 13th last, at an excessive speed, with failing to produce his licence, and with driving an unregistered car. Defendant pleaded guilty, saying he did not know the car was not registered. Police-constable Symes stated that the mark on the car was "AEC 12" and defendant was driving it at a speed equivalent to thirty miles an hour over a measured furlong. When stopped and asked to produce his licence, defendant said, "I am very sorry I have left it at home. I was not driving dangerously." Inspector J. Barnard said the mark on the car was a general identification mark of the manufacturers, a London firm. The Bench imposed a fine of £2, including costs.

IDENTITY OF DRIVER.

Messrs. J. E. Hutton (Limited) were summoned at Marlborough Street Police Court on the 20th inst. for that they, being the owners

The vehicle illustrated above is one which has recently been manufactured by the Wolseley Tool and Motor-Car Company, Ltd., and supplied to the India Office for Famine Relief Work in India.

The wagonette, which is fitted with a Siddeley 18-h.p. four-cylinder engine, has seating accommodation for fourteen passengers, the canopy being constructed to carry 10 cwt. of luggage. The Wolseley Company is supplying three motor-ambulances, constructed on similar chassis, to the War Office.

of a motor-car driven, as was alleged, in a dangerous manner at Walton-on-Thames, refused to give information as to the identity of the person driving it. Mr. Muskett prosecuted for the Commissioner of Police, and said the present case was one of public importance. Evidence was called that on October 12th a car belonging to the defendant company was driven at a furious pace along the Queen's Road, Walton-on-Thames, and that as the driver declined to stop only its number could be taken by the members of the Surrey Constabulary on the watch. Inquiries showed that the car belonged to Messrs. Hutton (Limited), but on being asked as to the name and address of the driver Mr. Hutton declined to divulge them. Mr. Mead said he should convict in this matter; but on hearing that there were two previous convictions against the defendant company at Grantham and St. Neots, adjourned the case for strict proof of them with a view to the consideration of penalties.

POLICE TRAPS.

IN consequence of the large amount of traffic on the Great North Road at Whetstone, the Commissioner of Police has given instructions for the speed of motor-cars to be closely watched.

ONE of the Form "B" Veeder Odometers, supplied to the London County Council, and fitted to a Darracq car, shows a record of 40,000 miles travel, and is still going.

FORTHCOMING EVENTS.

JANUARY, 1908.

- 1st (W.).—The Lights on Vehicles Act comes into operation in England, Wales, and Ireland.
 New Public Health Act comes into operation.
 4th-11th.—Dublin Motor Show.
 6th (M.).—Dinner of the Irish A.C. at the Gresham Hotel, Upper Sackville Street, Dublin.
 8th (W.).—Incorporated Institution of Automobile Engineers—Dr. H. S. Hele-Shaw on the Fuel Question.
 Special meeting of the Royal A.C.
 8th (W.).—First R.A.C. drivers' examination for 1908.
 9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.
 11th (S.).—Annual meeting of the Lincolnshire M.C.C.
 15th (W.).—Conference of Automobile Club representatives, convened by the Motor Union, at St. Ermin's Hotel, Westminster, S.W.
 17th (F.).—Annual Dinner of the Nottinghamshire A.C. at the Victoria Station Hotel, Nottingham.
 18th-Feb. 2nd.—Automobile Exhibition at Turin.
 24th (F.).—Annual Dinner of the Scottish A.C. at Edinburgh.
 25th (S.).—Feb. 1st.—Scottish Motor Exhibition in the Waverley Market, Edinburgh.
 26th (Sun.).—Criterium de Voiturettes and Coupe de l'Exposition Trial for motor-cycles organised by the Turin A.C. and the Motor Club of Italy.
 29th (W.).—First lesson of the course to be given by Mr. R. S. Currie to the Ladies' A.C.
 31st (F.).—Annual meeting of the Blackheath A.C.

FEBRUARY.

- 1st (Sat.).—Annual meeting of the Lincolnshire A.C.
 2nd (Sun.).—Reliability Trial of the Motor Union of Western India.
 7th-15th.—Manchester Motor Show at Belle Vue.
 12th (W.).—Mr. F. W. Lancaster on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 15th (Sat.).—Auto-Cycle Union Annual Dinner.
 20th (Th.).—Meeting of the Essex M.C.
 Mr. H. R. de Salis on the Inland Waterways of England and Wales from the motor-boating point of view.
 24th (M.).—Motor Show at Bcmabay.

MARCH.

- 21st-28th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

APRIL.

Auto-Cycle Union's Tourist Trophy Race and Quarterly Trial.

MAY.

- 10th (Sun.).—Targa Florio.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

- Royal A.C. Reliability Trial for Touring Cars.
 15th-19th.—Scottish Reliability Trial.

ROAD REPORTS.

PERTSHIRE.—The Secretary for Scotland has issued orders prohibiting and restricting motor-car traffic on certain roads throughout Perthshire. In the central district traffic is prohibited on certain parts of Madderty School and Inverdunning roads; while in the western districts the prohibition extends to parts of the Glenbuckie, Stronslaney, Auchlyne, Muirlaganmore, and Glenlochay roads. Speed is restricted to ten miles an hour on several portions of the highways.

COVENTRY.—At a meeting of the City Council of Coventry the Watch Committee have recommended the erection of several danger signs in accordance with the Motor Car Act of 1903. In the course of the discussion one speaker urged that the Watch Committee should do something to secure the closing of these roadways which were not sixteen feet wide to motor traffic. Alderman Fowler in reply said that he proposed to confer with the chief constable with regard to the carrying out of the Act.

MESSRS. Etablissements Hutchinson, 13, Meddow Street, W., who are the sole concessionaires of the wood fibre non-skid in this country, have announced their intention of proceeding against anyone manufacturing, selling or using in the United Kingdom any non-skid tyres with any wood fibre device excepting only such as are supplied by them.

BUSINESS NEWS.

WE hear that Mr. Algernon Hollis, secretary to Messrs. Smith, Parfrey and Co., Ltd., has resigned his position on that company's staff. PRATT'S MOTOR SPIRIT was used by Mr. W. T. Clifford-Earp in making his recent record on the Brooklands track.

LLOYD'S are now issuing "Napier" insurance policies at reduced premiums for six-cylinder cars of that type.

THE LIVERPOOL MOTOR HOUSE, LTD., of Peters Lane, Liverpool have secured from Messrs. Clement-Talbot, Ltd., the sole agency for the sale of Talbot cars in Liverpool and district.

THE UNITED MOTOR INDUSTRIES, LTD., have appointed Messrs. Rennie and Prosser, of Mitchell Street, Glasgow, the sole agents for "Castle" accumulators in Glasgow and a radius of twenty-five miles.

THE STEPNEY SPARE MOTOR WHEEL, LTD., have supplied the motor instruction classes at the Clarence Barracks, Portsmouth, with a Stepney wheel for use on their instruction car.

THE C.A.V. ignition specialities of Messrs. C. A. Vandervell and Co. are being introduced into Canada by the Franco-American Automobile Company, of 417, Guy Street, Montreal.

MESSRS. S. MAITLAND AND CO., who are well known to motorists in connection with Lyxavon, have removed to Prospect Place, Barnsbury, N.

WITH the title "Decisions after Testing," the Star Cycle Company, Ltd., have just issued an interesting booklet giving a number of appreciative letters from users of the popular Starling and Stuart cars.

IN connection with the illustration of Miss Kitty Gordon on her Daimler car, which recently appeared in the *M.C.J.*, we are asked to mention that the vehicle was supplied by Sir William Angus, Sanderson, and Co., 63-65, Percy Street, Newcastle-on-Tyne.

AS evidence that Mr. John Stirling, managing director of the Scott-Stirling Motor Company, Ltd., is fully alive to the importance of the export trade, it is interesting to learn that "Stirling" productions are already in use in the following countries:—The Argentine Republic, British Guiana, India, South Africa, Australia, New Zealand, Canada, Norway, Holland, Spain, Italy, and Egypt. The Scott-Stirling Motor Company, Ltd., are, we understand, laying themselves out for further developments in their foreign business in motor wagons using either petrol or paraffin fuel.

MESSRS. SHIPPEY BROTHERS have forwarded us an illustrated list of the Pope-Toledo cars which they are offering for sale to the public at reduced prices for delivery in February and March next. The price according to the list for £675 cars has been fixed by Messrs. Shippey Brothers free in London at the sale price of £450, with special prices for limousine and landaulet types. We have also inspected the comprehensive list of parts as supplied by the Pope-Toledo Company, containing some 450 separate articles, from a steering lever set screw, bolt and nut, to the rear axle complete. Altogether the list is of a most complete character.

THE prospects for the races in March next on the Ormond-Daytona beach, Florida, are assuming satisfactory proportions. Prominent among the events which it has been decided to run is a 250 mile race for strictly racing cars. The 100 mile race, standing start, for all classes, for the Minneapolis International World Championship, will also be held. Cars to qualify for the Sir Thomas Dewar Trophy and the Two-mile-a-minute Trophy must run in either the 250 or the 100 mile event, and average over fifty miles per hour for the whole distance. One of the most interesting events will be the Invitation Race, of 150 miles, for gentlemen drivers.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

COMMENTS.

A Happy New Year.

CONVENTIONAL though the greeting has become by its frequency, we may be excused for thus commencing the first number of another year. For the motor-ing community is scarcely like any other section of the people. There is a good fellowship among those who drive "mechanically-propelled vehicles on common roads," as our ancestor, the *Mechanics' Magazine*, was wont to describe the automobiles of the Thirties and thereabouts. True, it may not seem so universal as in the days when cars were few and breakdowns many. But the helping hand is still within the motor movement, and those who own as well as those who drive cars are generally willing to give others the benefit of their experience and knowledge. Not only is this shown when trouble occurs on the highway, but proof of the feeling is given from week to week in our correspondence columns, the ready willingness of our readers to assist each other when in difficulties being pleasantly conspicuous.

The Value of the Speedometer.

ALTHOUGH the cases in which magistrates are prepared to accept the registration of speed indicators against the word of the police are few, we are glad to notice that they are growing in frequency, and that the instance reported on another column of the present issue is not the *rara avis* it would have been a year ago. Even magistrates have been educated to the value of the speedometer—a fact that careful motorists should duly note. Hence we are glad to notice the tendency towards simplicity in the speed-recording devices now brought to the notice of those who own or drive cars. Of course, the instrument cannot yet be regarded as a certain preventive of a fine, but it at least offers a good defence where motorists are alleged to have exceeded speeds which are exaggerated—to put the expression as euphoniously as possible, in order not to hurt the feelings of Robert in the box or Nupkins on the Bench.

Another 24 Hours Record.

A GREAT motor-car run of twenty-four hours on the road has just been made in Australia, which exceeds anything yet done in that part of the world. Mr. H. L. Stevens, who is identified with the Darracq car in the colonies, and Mr. H. B. James, who is similarly known in connection with the Dunlop tyres, covered 777 miles in the twenty-four hours, which is 171 miles better than the continuous run credited to Americans last year. From the detailed accounts to hand the event shines in the excellence of the achievement, for at least one-fourth of the distance was run in a thick fog, through which the acetylene lamps on the car did not penetrate more than a dozen yards ahead. During the night trouble was narrowly averted owing to the droves of sheep and the horses met with in the rural districts which were traversed. The longest stop during the period of endurance was one of twenty minutes, when the fuel supply and the tyres were attended to. Not a detail of the Darracq car required attention. For five hours during the night the speed only averaged 27 miles per hour owing to the fog, so

that the speed at other portions of the trip must have been pretty good—in fact, the fastest pace attained during a given run of 110 miles during the daytime was 44 miles per hour. We understand from our correspondent that Mr. James next intends to attempt to beat the railway express time between Melbourne and Sydney, which is about eighteen hours for a distance of 570 miles.

The Inconsiderate Driver.

WITH reference to the letter from the Master of the Craven Hounds which appeared in our last issue, Major E. R. Portal, as a motorist and a hunting man, deploras, in language none too severe, the reprehensible conduct of the unknown motorist. In connection with this matter, the Berkshire Automobile Club has offered a reward of £10 for evidence leading to the conviction of the offender, whose conduct has created an outcry among the motorists of the county, and Major Portal, in sending us this information, hopes that such action, supplemented by the assistance of other motorists, may have a good effect, not only in leading to the discovery of the person concerned, but also in demonstrating to the public that motorists themselves condemn anything which savours of disregard for the feelings of others. It is unfortunate that a few instances of this kind should lately have occurred to mar the otherwise good record which the motor movement has had during the year just closed.

A Christmas Joke.

THE Christmas joke of 1907 was that played by some of the visitors to the Duke of Westminster on the lordly occupant of Cholmondeley Castle—an escapade which caused the Cheshire police as well as many officers from Scotland Yard much perturbation until it was discovered that the whole affair was a piece of merrymaking. Of course, the motor-car was dragged into the play, as it was in all the pantomimes a few years ago. The only result, so far as we can see, has been to demonstrate the utility of the automobile in the conveyance of property from one place to another—a fact which we had thought was sufficiently proved in the real robbery from Lord Lonsdale's house in December—and the expense in the police of the county being detailed from their ordinary duties to get upon a clue which only led the way to a set of jokers who scarcely realised the extent of their adventure. We are sorry that the motor-car should have been brought into the affair—that would have been an occasion on which it would have been justified in breaking down.

The Position in Scotland.

WE may trust the Scottish A.C. to be watchful of those county councils north of the Tweed which have lately been entertaining the public with discussions on the dangers of the highway, and the way things would be improved if they had control. Not long ago some of the local authorities in Scotland were discovered to have erected signs of speed restriction without permission of the central body, and their presumption was promptly noted by the motoring organisation. Now other councils are seeking to create an agitation against the reserva-

tion of power in such matters in the hands of the Secretary for Scotland, and having regard to the way in which the Scottish legislators secured the omission of the northern part of the kingdom from the new Lights on Vehicles Act, care must be taken in case an attempt is made to similarly secure exceptional treatment for Scotland in any future legislation with regard to automobiles. Many county councils have never peacefully accepted the present position. They would prefer to believe, with Alexander Selkirk, that "my kingdom there is none to dispute," and have the right of prohibiting altogether or restricting the speed of motor-cars within the area of their influence. Such a course would, however, be stoutly resisted in England, and we look to the Scottish A.C. to bring the necessity of uniformity in administration lucidly before the M.P.'s who represent constituencies where the pertinacity of the Scottish "heckler" is likely to be directed towards this point of local government and control.

A Request for Tolls.

THAT our suggestion should be very seriously regarded by the Scottish Club receives emphasis from the proceedings at the last meeting of the Argyllshire County Council at Inverary, when, on the appointment of a motor-car committee to watch the proceedings of motorists, Lord Breadalbane suggested

The Queen of Portugal entering the Brouhot Car used by Her Majesty during her recent visit to Paris.

(De Auto.

that a toll should be put upon each motor-car on entering the county. The meeting resolved that the suggestion be considered by the committee, and local papers are declaring that it is one that most people will regard as "eminently sensible and practical." We have heard of such "sensible and practical" ideas before. They are generally so described as they happen to fit in with the prejudices of the persons who thus favour them. The notion would not be regarded as sensible or desirable by the hotel-keepers of the country or by those who recognise that the coming of a number of cars with a larger concourse of people into a county may mean a considerable influx of money to be spent by traders of various degrees. To impose a toll in Argyllshire would mean the avoidance of its roads—in just the same way as the roads leading into Brighton were avoided for a season in the early days of motoring, after a vigorous attack of motorphobia by the county police outside the town. Then, again, the suggestion is as impracticable as it is inimical to local interests. If tolls were imposed in every county, the expenses of motoring would be vastly augmented, and would reach a point which would keep many moderately-financed motorists from touring beyond their own county boundaries. An army of officials, resembling those of the *octroi* of France, would be estab-

lished—with this difference, that instead of collecting from many sources, and thus possibly securing enough dues to maintain their upkeep, the county *octroi* established at every main road into the area would only demand *backsheesh* from one section of the community for one particular thing, viz., the right to use the roads that have hitherto been regarded as the public property for the convenience of all who behave themselves with seamliness and decorum. If such a plan were ever adopted we fancy the Scottish ratepayers would, after a month's experience, wish to return to the present path of economy and prudence. Probably Lord Kingsburgh, the Lord Justice Clerk of Scotland, will point out the legal arguments against Lord Breadalbane's proposal when he opens the motor show in Edinburgh at the end of the month.

The Liability of County Courts.

PERHAPS of more immediate utility to many of the Scottish councils would be the advice to set their roads in order, which seems the lesson to be gleaned from a case which has just been settled out of court. This was the action for damages resulting from a motor-car accident which was recently raised in the Court of Session against Elgin County Council by Mr. Basil Isles, of West Malvern, and his wife. The pursuers claimed £300 and £250 respectively, with £50 for expenses, and the County Council's offer to pay a sum of £250 in name of damages, along with the expenses of the action, has just been accepted, the matter thus being settled out of court. The accident occurred on July 8th last on a part of the road near Dulnain Bridge where it had been widened. Pursuer, who was residing at Nethybridge, was returning from Elgin along with his wife and three lady friends when, owing to the car wheels sinking deeply into the surface of the road, the vehicle ran into the covering of the culvert. Mrs. Isles was thrown from her seat, and her head struck the glass window screen with such violence as to completely smash the screen. The car was also seriously damaged by the accident. The case is important as an acknowledgment of the duty of local authorities in securing the safety of their roads so far as the users of the same are concerned.

The Dangers of Level Crossings.

DETAILS have become known of an exciting experience which befel a party of motorists who were travelling in North Staffordshire on Christmas Eve, and which emphasises anew the dangers of level crossings on railway lines. Mr. Ivor Guest, M.P., and his wife were motoring to Chester, and on the way had to pass over a level crossing at Weston Railway Station. The gates were closed to allow the Manchester-to-London express to pass through. There is a sharp curve at the approach to the gates, and before the motorists were aware of any danger they had crashed into the middle of the crossing. The gates were badly smashed and the motor-car was much damaged. The station-master knew that the express was due, and was anxious to avoid jeopardising the train. In great haste he succeeded in lowering the danger signal in time to prevent a terrible accident. The train steamed up and was delayed until the line was cleared. Fortunately none of the occupants of the car were seriously hurt, and assistance was quickly sent from Ingestre by Lord Shrewsbury. Several accidents have previously taken place at the same spot.

From Kingston to Woking.

THE removal of Superintendent Marks from the Kingston district is a matter of rejoicing among the motorists of that Thames-side town; it is a matter of some concern for those in the Woking area, to which he has been promoted. He will take charge of the new petty sessional division there, and doubtless those who motor along the main roads had better remember the zealous endeavours against motorists with which his name has

been associated in the past. We learn that during the four and a-half years he has had charge of the Kingston division about 1,000 summonses have been issued under his authority against owners and drivers of cars—probably a record. His value as an asset to the county is not to be lightly regarded.

The Duty of the Police.

ON Tuesday a motorist raised an interesting point at the Shropshire Quarter Sessions, and, what may seem very remarkable to southern motorists, the Court heard it with consideration and ultimately agreed as to its fairness.

At some cross road near Oswestry Mr. Percy, of Guy's Cliffe, drove under the recognised legal speed without sounding his horn, whereupon he was summoned for driving to the danger of the public, although—as often happens in such cases—there was no one about to be endangered, if we except a policeman who should have warned him of any risk he was running. This was the point of the defence, the motorist assuming that there was no

Not a hint of, or reference to, the testimonial was permitted to appear in the Press until the presentation actually took place.

Mr. Weigel's Case.

MR. D. M. WEIGEL is not to go to prison, and all motorists will join with us in expressing our pleasure at that fact. The Haywards Heath justices have never been friendly disposed towards motorists—to put the matter as leniently as we can—and having regard to the subsequent happenings at Lewes, the suggestion of imprisonment must be regarded as distinctly impertinent. Already the costs have mounted up to a considerable amount, and no motorist has ever found a summons under the Act of 1903 so expensive as the defendant in the case which was concluded at the East Sussex Quarter Sessions on Tuesday. The fact that the police consented, at the October Sessions, to a reduction of the period of suspension of the licence from two to one year seemed an acknowledgment of the too drastic character of the original

Mr. Charles Cordingley on his 40-50-h.p. Florentia at Medea, North Africa—the home of the Spahis, who are fighting so bravely for the French in Morocco.

danger as the policeman did not warn him. The Court allowed the appeal on that plea and quashed the conviction—a common sense ending of a case which ought not to have been taken to court at all.

A Seasonable and Suitable Present.

THE automobile is recognised as a suitable object of presentation to bishop and doctor. Several instances of the former favour have been reported in our columns. Now we hear of a remarkable example of patients' gratitude to a doctor.

This has been furnished at Weaverham, Cheshire, during the Christmas season. Dr. Smith, of that town, was unostentatiously presented with a motor-car, with accessories and motor-house complete, by the inhabitants of Weaverham, Acton, Delamere, Cuddington, Norley, and surrounding districts. The gift was made in recognition of forty years' professional services and eighteen years' service as a Cheshire county councillor. A total of £720 was raised, 1,500 subscribers responding within a month.

judgment; and seeing that the costs have increased so alarmingly, the infliction of the maximum monetary penalty will be regarded by many as an attempt to exact the utmost penny from the unfortunate defendant. Anyhow, the period of suspense is over, and while congratulating Mr. Weigel on escaping the intention of the Haywards Heath magistrates, we would suggest that the procedure in the case forms a strong argument for the motoring organisations giving serious consideration to the machinery of the law before new legislation is instituted.

THE DAIMLER COMPANY have received through the Ross-leigh Co., Ltd., Aberdeen, an order from Mr. James Murray, M.P., for a 30-h.p. Daimler chassis with a 10 ft. 6 in. wheel-base.

THE exports of motor-cars and parts from the United States during October last attained a value of £63,613 as compared with only £49,418 in the corresponding month of 1906. England heads the list with £23,694 of the total, Mexico being second with £8,954.

SOME USEFUL FACTS FOR BEGINNERS.

BY H. WAYMOUTH PRANCE, A.I.E.E.

THERE are certain facts—small points in themselves, but nevertheless important ones—which do not appear to be common knowledge amongst ordinary amateur motorists, the knowledge of which would in many cases be the means of preventing many “breakdowns” and similar troubles, and whilst these facts may have at some time or other been told to the motorist in his early days of instruction, they do not appear to be remembered in the way that other information of a more important nature does; hence it has been suggested to me by a former pupil that these useful facts should be committed to paper for the enlightenment of amateur motorists. No startling novelties or new methods must be looked for among these hints, and the reader must bear in mind that the information set forth is more intended for the beginner than for the veteran motorist of some seven or eight years’ experience, and that the facts are merely those which everyone should bear in mind if the path of their motoring experience is to be made as smooth as possible.

Perhaps the most frequent point of this nature which is overlooked is in the matter of testing accumulators. The motorist, say, is aware that his accumulators have been standing for some time, and in order to make sure that they are all right before going out for a run he tries them with a voltmeter or a test lamp momentarily applied and satisfies himself that the voltage shown is over 3.8, or that the lamp glows brightly, and

Touring in Germany.—The Hall of Records, Frankfort-on-the-Main.

starts upon his way—only to find that after a few hundred yards the engine misses fire badly and finally stops altogether—the accumulator having “run down.”

The fact to be borne in mind in this connection is that in order to obtain the true voltage of an accumulator the test must be made immediately after a current has been “taken out” (I have purposely used the popular but technically incorrect expression), as the cells recuperate when standing idle and so give an almost normal voltage when tested momentarily. Personally I prefer a test lamp as being the simplest instrument for determining the condition of an accumulator, but it must be remembered in using it that it is no use merely touching the terminals of the cells with those of the lamp, as the latter would be sure to glow brightly for an instant unless the accumulator was absolutely discharged. In order to obtain the true voltage the lamp must be connected up to the cells for one or two minutes and a current thus “taken out” of them and if at the end of this period the lamp still continues to glow brightly, it may be concluded that the accumulator is not in a discharged state.

If the exact voltage is required, it may be obtained by applying the voltmeter immediately upon removal of the lamp, or one of the wires leading to the contact maker may be short-circuited to the engine, one of the coils thus put into operation for half a minute or so, and the voltage then noted. Special voltmeters can be obtained which themselves take an appreciable quantity of current, in which instance it is of course not necessary to use a lamp or one of the coils to allow a current to pass. As

a rough and ready way of seeing if an accumulator is discharged one of the coils may be made to “buzz”—I am speaking, of course, of the trembler type of coil—by short-circuiting the contact maker, and if it continues to do so steadily at the end of half a minute or so it may be taken that the cells are still capable of giving a steady current.

It is, perhaps, hardly necessary to warn the reader that the terminals of an accumulator must never be short-circuited by direct metallic connection, and that the method of “testing”—which I have not infrequently seen performed by garage mechanics—by intermittently shorting the terminals with a knife blade or other piece of metal, and noting the spark produced, is extremely injurious to the plates of the accumulator. Before leaving the subject of accumulators—although the matter can hardly come under the name of knowledge—it may not be out of place to draw attention to the necessity of keeping the terminals clean and well-greased—a precaution which is not infrequently altogether neglected, with consequent corroded terminals, bad contacts, and broken lugs.

The adjusting of the platinum screw of a trembler coil is a matter which is looked upon by many motorists as a difficult operation, possibly because at some time or other, when trying to improve this part of the ignition apparatus, they have only succeeded in putting the coil out of action altogether, but in reality, if the principle of the trembler coil is properly understood, the adjustment is of the simplest nature possible. First of all it must be remembered that the greater the number of times the primary circuit is broken the fiercer the spark produced at the plug, so that the platinum point should be screwed down until the trembler blade is vibrating at its highest possible rate—that is, until it is buzzing at its loudest and highest note when the current passes, any particular coil which is desired to adjust being brought into action by short-circuiting the contact maker wire belonging to it to the engine. The adjustment can, of course, be overdone, as, if the trembler blade is pressed down too close to the central core of the coil it will stick to the core when the current passes instead of vibrating freely, but if the blades be set properly it will be found that the highest and loudest note is produced before the platinum point is screwed down to such close adjustment. It should be observed that when the locking nut of the platinum-pointed screw is tightened the tip of the screw may be slightly raised, and therefore allowance should be made when making the adjustment so that the trembler buzzes at its loudest and highest note when the contact screw is securely held by the lock nut.

The tyres are a detail which is looked upon with some apprehension by the purchaser of a new car, and certainly the depreciation of the tyres does form a very appreciable item in the running expenses of any motor vehicle; but, apart from luck, and I agree that there is a certain amount of luck about the wear of tyres, much can be done to get the utmost out of them, the principal points being immediate attention to small cuts and proper inflation. There seems to be some uncertainty as to what is implied by proper inflation and as to the best method of ascertaining that this detail is in order. Of late pressure gauges have come much to the fore for this purpose, but by far the simplest method of ensuring that the tyres are sufficiently hard is to inflate them until there is no side roll perceptible in them when the wheels are rocked laterally, the full weight being upon the wheel, or, in other words, to maintain them at such a pressure that there is no “bulge” at the point of contact with the ground when the car is fully loaded.

It is notable that the ignition apparatus and the tyres are responsible for over seventy-five per cent. of the troubles of many motorists, and they are details which are well worth studying from every point of view, as knowledge concerning them will in many cases avoid delay or enable an immediate and correct remedy to be effected should they arise, and it is hoped that these few notes may be of assistance to beginners in affording definite instructions in the matter.

LAST year the failures in the leather and coach trades numbered 163, as compared with 181 in 1906.

THE PRINCE HENRY OF PRUSSIA TOURING COMPETITION.

THE regulations with regard to the Prince Henry of Prussia International Touring Competition, which is to be held in Germany in June next, in the place of the Herkomer event, have just been issued by the German Imperial Automobile Club. It was originally intended to make the contest one solely for amateurs, but it was represented to Prince Henry that, if this was adhered to, German manufacturers would have no event during 1908, and it was finally decided that they should be admitted. Measures have been taken, however, to place amateurs driving their own cars on a comparative equality with expert drivers. The event is open to four and six-cylinder cars with a total piston area of from 227 to 679 sq. centimetres, corresponding to a bore of from 85 to 146.5 mm. for four-cylinder engines, and one of from 69.5 to 120 mm. for six-cylinders. Cars must have been driven at least 2,000 kilometres before the start of the trial, by members of internationally-recognised motor clubs and the affiliated German clubs. The vehicles must have four seats, and be in accordance with the police requirements. The total weight of the car must, in the case of an engine of a total piston area of 227 sq. centimetres, reach at least 860 kilos., exclusive of spare tyres, tubes, and with empty tool boxes. For

factor, and *vice versa*. A competing car with more than twelve bad marks forfeits all claim to the award in the speed trials.

The general conditions under which the contest will be carried through may be summarised as follows:—During the run every car must carry at least three passengers, including the observer. In the speed trials four persons or three adults and a ballast of 70 kilos. must be carried. A driver may temporarily, and at his own responsibility, hand over charge of the car to his chauffeur or any of the passengers, but not in the speed trials. Any repairs necessary during the tour may be effected only by the driver nominated and his chauffeur, or, in default of the latter, by a passenger to be nominated before the beginning of tour. Every repair means a mark, even though the car remains in motion. Every involuntary stoppage of a minute, or fraction thereof, caused by the car itself or any part of it, will be debited with 2-10th mark; also every minute or fraction thereof during which repairs are being effected. Repairs to speed indicators and their gear are to be recorded, but not debited. Any excess of the time allowed for repairs prior to start are to be debited with 2-10th mark for every minute or fraction thereof. Additional filling of cooling and braking water after the start of a day's run will be debited with 5-10th mark for each occasion. During the day's run fuel and oil may be taken in at specified stations only, but not cooling water. Competitors will be allowed to spend one hour daily in making

Near Briançon.

Snowed up at Aiguilles.

WINTER MOTORING IN THE FRENCH ALPS.

fuel (petrol, water, and oil) a minimum of 60 kilos. is allowed. For every extra square centimetre of piston surface the minimum weight increases by 1.4 kilo. No alterations in weight of car may be made during the tour, and no ballast will be allowed. Every car must be provided with a speed indicator. As fuel, only petrol of 680 s.g. and upwards, benzol, alcohol, and their mixtures may be used. Competing cars must be driven by the members of the above-mentioned bodies, and receive no remuneration for driving.

The programme of the tour is briefly as follows: June 7th and 8th, weighing-in of cars; June 9th, Berlin—Dantzic; June 10th, Dantzic—Stettin; June 11th, Stettin—Kiel; June 12th, rest in Kiel; June 13th, Kiel—Hamburg, speed-trial on the level between Rendsburg and Itzehoe; June 14th, exhibition in Hamburg; June 15th, Hamburg—Cologne; June 16th, Cologne—Treves; June 17th, Treves—Frankfurt-on-the-Main, between Treves and Frankfurt a hill-climb will be held.

The awards in the speed trial and the hill-climb will be based on two formulæ giving normal speeds, and the cars credited or debited with 1-100th mark and 1-200th mark for speed on the level and hill-climbing respectively according as it exceeds or falls short of the fixed standard by 1-10th per cent. or fraction thereof. In the event of a tie in marks for the hill-climb, the speed trials results will be taken as the deciding

adjustments, oiling, and filling up the tanks with petrol and water. The order of starting each day will be governed by the horse-power of the cars; the speed of the vehicles will be regulated by official vehicles, which will accompany the competitors on their daily runs. No fewer than six prizes, in addition to Prince Henry's Cup, will be offered. The concluding regulations provide that the trophy can be won outright by the same competitor securing the premier place in the event on two occasions, or by ballot amongst the winners of three years. The entry fee is £20 per car, the list closing on April 1st and at double rates on May 1st. The German Imperial Motor Club undertakes at its own expense accident liability and fire insurance within reasonable limits.

In August last a 24-h.p. De Dietrich car was successfully driven to the summit of the Prarion, in the Alps. The mountain is 1,860 metres high and separates the valley of Chamounix from that of St. Servais-les-Bains. In connection with the event an open challenge for £200 has been instituted for the first car which performs the same feat within 2 h. 50 min., a challenge which has just been accepted by Mr. W. M. Letts, who proposes to make the attempt on an English-built Lorraine-Dietrich car in July next.

ANTICIPATIONS OF 1908.

ALTHOUGH a year of steady advance in Motorism the events of 1907 need not long detain us on the threshold of another year. In this country the opening of the Brooklands Track at Weybridge, the various exhibitions, including the twelfth automobile show at the Agricultural Hall, London, in the spring, the Scottish Reliability Trial and the numerous controversies raging round the organisations associated with the movement constitute the outstanding features of the year. Side slip trials, long distance reliability runs, tar-spreading tests, commercial vehicle trials also played their part in the doings of the twelvemonth, among the pleasurable recollections of which was the formation of the Motor Club and its rapid advance as a social institution in the motoring world.

The tendencies of design as shown by the 1908 models of the leading motor-car builders have so recently been dealt with in these pages that the increasing attention which is being paid to the production of reliable vehicles of somewhat less power than have prevailed during the past year or so need only be alluded to. In France, in particular, the single-cylinder vehicle, far from being dead, seems to be enjoying a larger degree of popularity than ever. On this side of the Channel the increasing use of automobiles in their true sphere—that of substitutes for

bye-laws in Birmingham provide for the exhibition of a light in the direction in which the vehicle is proceeding, not only at night but during the prevalence of foggy weather. Moreover, in the case of vehicles carrying timber, ladders, or other projecting articles, the bye-laws require a red rear light to be displayed irrespective of the limit of projection. The question has arisen whether the new Act has not abrogated the provisions in the bye-laws regarding the lighting of vehicles, and whether the recently revised Hackney Carriage and Stage Coach Bye-laws in so far as they refer to lighting will not have to be re-sanctioned. The Lights on Vehicles Act, while stating that local bye-laws dealing with the same subject shall cease to have effect, leaves power to local authorities to make fresh bye-laws or regulations imposing obligations additional to those imposed by the new Act.

Pleasurable are the anticipations with regard to the "great event" of 1908, a combination of the various features of previous trials that have proved valuable in the development of the industry. It will remind the provincial towns of the historic 1,000 miles trial of 1900, serve to emphasize that the Tourist Trophy events in the Isle of Man are no more—the Rover and Beeston-Humber having made great achievement therein in 1907—and to uphold the prestige of the Scottish trial, concluding with a fine dash of speed on Brooklands track. Thus it will be both educational and attractive

Touring in Bohemia.—A Fiat Car on the Summit of the Heidelberg, near Hohenelbe, 3,400 ft. above sea level.

(Allgemeine Automobil Zeitung.)

horse-drawn vehicles—and the ever advancing vogue of covered cars are prominent features of the situation. Petrol cars still form the large majority of the vehicles in use, but the steam automobiles at present on the market appear to be not only retaining their old admirers but to be steadily gaining a more extended clientele. The many new designs, too, of combination petrol-electrical vehicles that have recently made their appearance give promise of some further practical progress in this direction in the not far distant future.

New legislation affecting motorists which came into operation on Wednesday comprised the Lights on Vehicles Bill, and certain clauses in this Act render compulsory the carrying of lights by vehicles at night in England, Ireland and Wales, Scotland having been omitted from the operation of the new law. It becomes incumbent upon the owner of any vehicle to provide a suitable lamp or lamps in proper working order, and the driver is made responsible for keeping the lamp or lamps properly trimmed, lighted and attached. Section 1 of the Act provides that vehicles shall display to the front a white light visible for a reasonable distance. If the lamps are so constructed as to permit a light to be seen from the rear, that light shall be red. Vehicles used for the purpose of carrying timber, or any load projecting more than six feet to the rear, must display to the rear a red light visible for a reasonable distance. This new legislation is causing some discussion in counties and county boroughs which have special bye-laws on the subject of lights on vehicles. Thus the existing

to manufacturer and the public alike. There is much to be said in favour of the trade concentrating on one important event in the year, and this feeling, combined with the advertisement use to which private club competitions have been put, has resulted in the Royal A.C. ultimatum with regard to hill climbs and similar contests proposed to be held by provincial clubs on county roads. Just now a plebiscite is being taken with regard to the advisability of supplementing the great trial which will be held in June with a race in Manxland in the autumn. Opinion, however, is at present so divided that prophecy is really useless. There is no doubt much to be said for the commercial acumen of those firms who limit their seasonable activities to the exhibition in the spring, the trial in the summer, and the development of their own plans for trial runs by intending purchasers throughout the year.

While the prospective motorist will give great heed to the event just mentioned, the public may be expected to have their curiosity further aroused—if their enthusiasm is not reached—in the possibility of the Brooklands motor track. Already challenges have been definitely accepted and deposits paid, so that sporting events that last year never got beyond the correspondence columns of the papers may really take place in 1908. Beyond that the committee, profiting by the criticisms and the experiences of the past season, have developed a programme of sport that should furnish a plethora of exciting finishes such as were absent, save in isolated instances, last season. The means by which these will be secured are set forth in the reference to the

Brooklands Club in our Clubs and Associations page elsewhere in the present issue. The track certainly bids fair to become historic in the annals of the sport, and motorists in other countries deplore the absence of such enthusiasts as Mr. Locke-King, to whose enterprise and initiative the origin of the track was due. So far the most notable records obtained thereon are the 1,581½ miles traversed by Mr. S. F. Edge on his Napier in the twenty-four hours, and that to the credit of Mr. W. T. Clifford-Earp, who on a 60-h.p. six-cylinder Thames car accomplished the 100 miles in 1 hr. 18 min. 50.43 sec.

Doubtless 1908 will have its racing surprises, especially as several English representatives will be seen on Continental roads, and, on the other hand, Italian record makers have already been nominated to take part in British events. A brief diversion from "anticipations" to "recollections" may be pardoned, as it suggests the cars that will have to be beaten if 1908 is to be a faster year than that just closed. The first surprise came in the Coupe des Voiturettes over the Sicilian course of 188 miles, when the little Sizare-Naudin won in 7 hr. 47 min. 9 sec.; then came the succession of Italian victories—Nazzaro on his Fiat winning the Kaiserpreis and also the Targa Florio, the latter in 8 hr. 17 min. 36 sec., over a ninety-three miles course of frequent corners, which had to be traversed three times. Nazzaro was also successful in winning the Grand Prix, while the Florio cup went to the Isotta-Fraschini and the Coupe de Vitesse to the Itala. The Herkomer Trophy was won by a 45-h.p. Benz, and a Mercedes went up the 6½ miles of the Semmering Hill in 7 min. 29 sec. As an example of endurance mention, too, must be made of the adventure of Prince Borghese in motoring from Pekin to Paris on his Itala, as we illustrated in our last week's issue and described while the journey was in progress.

Makers have latterly shown a tendency to recognise more and more the importance of the driver as a factor in the running costs of their cars, and prizes and certificates have been introduced by several firms with the view of encouraging those in charge of vehicles to take an intelligent interest in their mechanism. This idea has received official sanction in the heavy vehicle section of the industry, as was shown in the recent parade of commercial motor vehicles owned within a radius of twenty miles from Charing Cross, when one of the prize-winners, in the employ of the Westminster City Council, had driven his vehicle over 63,000 miles. The value of the driver will, we anticipate, be even more appreciated in the future, judging from the remarks of those responsible for the motor-cab services now coming into profitable recognition. They plainly see that human intelligence and knowledge must be combined with mechanical reliability and excellence.

It may safely be pointed out that more will be heard of the dust and road questions. 1907 was exceptional in the amount of wet which assisted the laying of the dust. We cannot always expect, nor do we want, such a summer; and consequently motorists and surveyors must again apply themselves to the diminution of the quantity of dust raised by motor-cars on roads which were not constructed for such traffic. The movement in favour of the maintenance of the great highways of the country being made a national charge will also go ahead, and then, possibly, new legislation will loom large on the Parliamentary horizon. That is one reason for a continuance of the consideration to other users of the road, which all will agree is becoming more marked as the number of automobiles increases and as the motorists, who now total nearly a quarter of a million, grow in proficiency as well as in numbers.

THE Bishop of Bath and Wells has had an exciting adventure in the flooded marsh district of Somersetshire. He was motoring from Wells to Taunton, when his car ran into deep water near Othery. The car went so far that it would move neither backward nor forward, but an obliging rustic brought a horse, with which he triumphantly dragged the bishop and his car out. "This is a triumph for the horse," observed his lordship, who reached his destination an hour late.

SOME USEFUL NOTES.

A FREQUENT cause of loss of power, not usually ascertained at once, is due solely to the wearing of either the valve tappets, the ends of the valves, or the wear of both of these parts. Where the tappets are adjustable the remedy is obvious, but where no provision of this sort has been made, it is a very good plan to have the tappets drilled out, so that small fibre buttons can be inserted. This is easily done, and the fibre can be trimmed to the correct thickness. It is also a very effective method of deadening the usual clicking of the tappets.

IF, while on a run, the brakes are found not to hold properly, they should be attended to before anything serious happens from the lack of them. The difficulty may be only one of faulty adjustment, in which case a few moments' work with the wrenches will set the matter right.

IF a car needs re-painting, it is better to have it done now than to wait until the spring, when the factories are crowded with work. By having the painting done at this period of the

Mr. G. Senior on his 40-h.p. Weigel Car which he is continually driving over the moors in Devon.

year motorists will not only be assured of a first-class job, but the varnish will have ample time to harden.

NEVER attempt to grind petrol or compression taps with emery—it will generally ruin them. The most suitable compound for this work is the damp sand from the bottom of a grindstone trough.

CARBON deposit in the cylinder and piston heads is one of the most fruitful sources of trouble in petrol engines. If the cylinders get too much oil a portion of it will work up past the pistons; the intense heat will consume or evaporate the oil, leaving a deposit of carbon; this may be augmented by too rich a mixture, which serves to deposit lamp black or carbon in a film on the inside and top of the compression chamber and on the heads of the pistons. The film thus formed will in time commence to scale, and, the projections becoming fused by heat of the explosions, will serve to prematurely ignite the charge. The symptoms are knocking in the cylinders—as if the spark were too far advanced. The remedy is to take off the cylinders and scrape off the carbon deposits, being careful not to scratch the cylinder walls. The preventive is to so regulate the oil feed as to give the cylinder plenty of, but not too much, oil.

THE PASSE PARTOUT TWO-SEATED CAR.

A LITTLE two-seated car which is just now attracting considerable notice across the Channel, by reason of its excellent performance in the recent trials in France, when the full team of three vehicles successfully went through the six daily runs and the final speed contest, is that known as

Figs. 1 and 2.—Elevation and Plan of 8-h.p. Passe Partout Car.

the Passe Partout, made by the Société des Automobiles "Le Passe Partout," of Neuilly, Paris. The vehicle, of which we give illustrations in Figs. 1, 2 and 3, has a frame of pressed steel, narrowed at the front to increase the lock of the steering wheels, and raised at the rear end to clear the differential casing. The motive power is supplied by a De Dion 8-h.p. single-cylinder engine, having coil and accumulator ignition. The advance and retard is actuated by an autoloc lever on the steering wheel; the

Fig. 3.—General View of 8-h.p. Passe Partout Car.

throttle is similarly controlled, a foot accelerator being also provided. The water circulation is maintained by a pump gear driven off the engine. As will be seen, the radiator and bonnet follow the lines adopted in the C.G.V. vehicles, the former being mounted below the frame, so that when the bonnet is raised all parts of the engine can be easily reached.

The clutch is of the leather-faced cone type; it is mounted on an extension of the crank shaft and has an external spring.

The shaft which connects the clutch with the gear-box is provided with a joint to allow for any want of alignment between the two parts. The gear-box, which is supported at three points, is adapted to give three speeds forward and a reverse, with direct drive on the top, the control being by a single lever. The gear-box is cast in one piece, and is provided with a large and quickly detachable cover, special care being taken to prevent any annoying leakage of oil. The final drive is by a cardan shaft and bevel gear to a live axle, which is provided with a stout torque rod extending from the differential casing to a cross member of the frame, where it is supported in a spring bracket.

The usual foot and hand brakes are provided; they are all of the metal-to-metal type, the drum of that at the rear of the gear-box being provided with cooling ribs to prevent any overheating. Ball bearings are provided to all parts except the engine; the lubrication of the latter is maintained by the pressure of the exhaust; a useful fitting is seen in a large plug-hole at the rear of the differential casing to enable the latter to be readily filled with oil. Semi-elliptical springs are used at the front and three-quarter elliptic at the rear. The standard two-seated car has a wheel base of 7 ft. 2 in. A long chassis for three and four seated cars is also being made, the wheel base in this case being 8 ft. 6 in. The Motor Supply Company, Ltd., of Piccadilly, W., are the British agents for the Passe Partout cars.

A NEW VALVE-GRINDING TOOL.

WE illustrate herewith an ingenious valve grinding tool which has lately been put on the market by the "Jef" Manufacturing Company, 1,562, Broadway, Denver, U.S.A. Its mechanism is the same as that of a well-known egg-beater, the

tool being held in one hand and operated with the other. The crank handle turned by the operator is connected to a bevel wheel, which meshes with a bevel pinion, a small pinion secured to the latter meshes with another wheel at the top of a vertical shaft which, at its lower end, carries a crank arm pin, from which a link connects to another longer crank rigidly connected with the chuck holding the grinding tool. It will readily be seen that by turning the crank handle the tool is given a rotary reciprocating motion, as required for grinding in valves. It is claimed that by the use of the machine a valve can be ground within less than half the time occupied by hand.

THE 1908 catalogue of Siddeley cars, issued by the Wolseley Tool and Motor Car Company, Ltd., a copy of which is just to hand, is on novel and pleasing lines. Not only are particulars and line drawings given of the different models, but the main component parts are depicted by half-tone blocks; the feature of the production, however, is a series of full-page illustrations, in colours, depicting the different types of bodies which may be fitted to the chassis, interest in the pictures being enhanced by the backgrounds, which are in keeping with the subject.

APPLICATIONS for licences for motor taximeter cabs to run in Glasgow and Edinburgh are now being considered by the authorities of both cities.

ON New Year's Eve the centenary of Cl-ridge's Hotel, in Brook Street, W.—where the Ladies' Automobile Club has headquarters—was celebrated by a ball, at which the dancers were attired in the costumes of 1808.

SOUTH BARRULE, the Manx mountain, which was known in connection with the earlier motor contests, has been devastated by a fire which began on Monday night and raged throughout Tuesday.

MATHIESON'S "Handbook for Investors for 1908" comes to hand in its usual comprehensive form, giving an authoritative record of Stock Exchange prices and dividends for the last ten years. It is published by Mr. Effingham Wilson.

MR. C. C. ALLEN, instructor in motor-car engineering at the Coventry Municipal Technical Institute, has been appointed to a similar post in Auckland, New Zealand. The motor engineering classes at Coventry will now be carried on under the care of Mr. E. Sidwell.

MR. W. O'MEARA, who has been in charge of the touring department of the C.T.C. for ten years, has been appointed head of the new touring department of the M.U.

MR. A. G. BELL, of the Victoria Garage, Milford-on-Sea, sends a calendar for 1908, with autograph topical allusions to motorism that give it special interest to all engaged in the business or pastime.

THE Clerk to the Surrey Quarter Sessions at Kingston on Tuesday referred to the recent case in which an A.A. scout was fined for obstructing the police when timing motor-cars, and suggested that in future instances a charge might be preferred against the members of the Association for conspiracy.

MESSRS. BARNETT AND LEWIS, of Red Lion Street, Wolverhampton, have taken the St. Peter's Works in St. Mark Street of that town for the purpose of a private garage. The alterations will include a new entrance to the building from Salop Street, and the fitting of shops for the repair of motor vehicles.

IN view of the extremely cold weather which we are just now experiencing, it may be useful to mention that Messrs. Gamage have lately introduced a safety motor house stove, which will heat the stable all day or all night without attention, and without giving off smoke or fumes; the stove is sold at a relatively low price, and the cost of operation is stated to average 4d. per day.

AT the Bray (Co. Wicklow) Petty Sessions, on Saturday, the resident magistrate stated that motorists offending against the provisions of the Motor Act, which gives summary jurisdiction, might defeat justice in Ireland, because there is no process by which they can be made amendable once they leave Ireland. The circumstances were different in England, he added, for there was full provision for enforcing summary jurisdiction against defendants there.

THE Automobile Club of Egypt lately held a successful motor gymkhana at the foot of the Pyramids.

THE Weigel Company has written to the "Auto" of Paris stating that they are entering

three cars for the A.C.F. 1908 Grand Prix race; they will be fitted with four-cylinder engines, and are expected to be on the road in about six weeks.

MR. E. J. UNDERWOOD has commenced business as a motor-car agent at 35, Carlton Crescent, Southampton, and will deal in the various parts of and accessories for cars.

A COMPANY has been formed to run taximeter cabs in Birmingham. Their headquarters are to be found in the block of buildings belonging to the Premier Motor Agency, Aston-road, Birmingham. The first cab, a Renault, is now running in the city.

THE Dumfries Motor Company, Ltd., who have a showroom at 93, English Street, Dumfries, and a garage and repair shop equally centrally situated, send us a useful desk calendar, which also serves to emphasise the comprehensive character of their establishment.

IN connection with the race meet to be held on the Ormond-Daytona beach, in Florida, next March, it is proposed to lay out a course of from twenty to thirty miles in length, with loops at each end, suitable for long distance contests.

THE report of the Coventry Motor Omnibus Company, Ltd., states that the total number of shares allotted is 1,002, entirely for cash. The particulars of payments show £746 for omnibus and accessories, and preliminary expenses amounting to £120.

WE have received a copy of the 1908 edition of the Agenda-Buvard du Chauffeur, published by Madame J. Lockert, 41,

Rue de Seine, Paris. The feature of this annual diary, which is now in its sixth year, is the amusing caricatures, printed on the blotting sheets, of prominent members of the French and English motor industry.

TWO taximeter motor-cabs are now plying for hire in Manchester. The cabs differ from those which have proved so successful in London, inasmuch that they have a seating capacity up to four persons, whereas the London cab only seats two and the driver. For the present the Manchester Motor-Taximeter Cab Company are testing the requirements of the city with two cabs. The fares are the same as with the horse-driven vehicles; 9d. per mile is the minimum charge.

THE Rotax Motor Company's No. 263 patent head lamp embodies the latest improvements in the art of lamp making. For those who prefer electric lamps, a very smart set of lamps is the Rotax No. 2, which are sold in sets consisting of two side and one tail lamp, and can be worked by any 4-volt accumulator. These are of English production. The firm, whose headquarters are at 43 and 45, Great Eastern Street, E.C., also specialise in horns, and have a large variety for the coming season. Horns with two, three and four notes are amongst the number which are offered to motorists.

The Fiat Motor-Bus which has lately been put into operation in Amsterdam. The chassis, which was supplied by Messrs. Verwey and Lugard, of The Hague, is of the 18-24-h.p. type, while the single-deck body is that of an old tramcar. (De Auto.

MESSRS. WILSON AND STOCKALL, of Bury, are supplying the Salford Corporation with a motor ambulance van.

AN effective circular has been issued by the Birmingham Small Arms Company, Ltd., combining New Year's greetings with a reminder of the extent of the firm's operations.

MESSRS. A. R. ATKEY AND CO., LTD., of Nottingham, are demonstrating the advantages of their four-ton wagon to the brewers, millers, engineers, builders and contractors of the county.

FROM Messrs. Heath's garage, 49, John Bright Street, Birmingham, comes an excellent calendar reminding us of their facilities for meeting the requirements of the motorists of the Midlands.

A RESOLUTION asking the Ellesmere Urban District Council to support the regulation of the speed of motor-cars being placed in the hands of urban and rural councils has been ordered to lie on the table.

MR. R. E. ANTHONY is opening the Bromley Electrical and Motor Engineering Works and Garage on the Sevenoaks road, Bromley, Kent, and will give attention to the requirements of motorists passing that way, as well as those resident in the town.

AMONG the novelties at the recent Paris *Salon* was the simple yet ingenious tool to facilitate the removal of valves, illustrated herewith. It is known as the "Partout," and is being introduced by the American Auto Supply Company (Messrs. Schwartz and Albrecht), of 11, Rue Dartois, Paris. As will be seen, it consists of three parts—a hook, a chain, and a lever.

The chain, which is supported by the hook from any suitable part of the engine, passes through specially shaped holes in the lever. Once the latter is adjusted in position, the chain is rendered rigid therewith by moving it into the narrow part of the hole; it then forms a fulcrum for the lever, enabling the valve spring to be raised without difficulty and the cotter pin removed.

A MOTOR-CAR exhibition is to be held in the St. Lawrence Arena, Toronto, Canada, from the 21st to the 28th March next—the same week that the Cordingley Show will be held at the Agricultural Hall, London.

MR. LAWRENCE BELL is the managing director of the Peebles Motor Company, Ltd., of Tweed Green, Peebles. Nearly a dozen cars are maintained for hiring purposes, and the plant is well devised for repair work as well as the ordinary garaging of automobiles.

"KUKLOS" is the *nom de plume* of Mr. Fitzwater Wray, who writes motor notes for the "Daily News," as well as columns of touring gossip for cyclists. Some of the latter articles have been reprinted as "A Vagabond's Note Book," issued from the office of the journal in which they originally appeared. Those on Brittany, Ireland and Lakeland are full of interest, the author's characterisations of persons, as well as of roads, proving the possession of an observant eye. The two hundred pages are enlivening reading, and the only suggestion we would make is that the second edition should contain some reproductions of Mr. Wray's photographs, which would give a "local habitation and a name" to some of the scenes he well describes.

WE understand that Mr. Frank Morris, the well-known eastern counties pioneer of automobilism, and erstwhile automobile engineer to His Majesty King Edward, is severing his connection with the manufacturing branch of the business at King's Lynn, and is shortly identifying himself with a new London undertaking.

THE G. and R. carburettor, which was illustrated and described in the *M.C.J.* of May 18th last, is now known as the Acton. It is made by the Acton Carburettor Company, of Sawclose, Bath, and is claimed to be not only absolutely automatic in its action, but to use any grade of spirit, and to effect an economy in consumption.

AN instance of the rapid strides by which mechanical traction is superseding the horse is afforded by the fact that the Bishop of London has decided to do away with all his horses and carriages and henceforward rely upon motor-cars only. This hard-working bishop only began motoring a few months ago, but, since that time he has travelled thousands of miles by car and has never once been delayed on the road or late for a single appointment. Moreover, he finds it possible to carry out many more engagements than he formerly could. His lordship has just placed with the Motor Supply Company, Ltd., another order for a 14-20-h.p. Renault double landaulet, so made as to be completely open by day and to close at night, when the inside of the car will be electrically illuminated.

MESSRS. J. WILSON BROWNE AND SON, 34, Ludgate Hill, Birmingham, for whom the Motor Accessories Company are London agents, have issued an attractive poster, which should serve the provincial trade in drawing attention to the "Orto" motor lamps made by the firm. These are made for the head, sides, or rear of the car, and are all of high grade quality as well as good design. The head lights are the separate-generator-type of lamp, and are fitted with Messrs. Browne and Son's lens mirror. The "Orto" special side lamp has a patent dioptric lens to the steps on the inside, so that the front of the lens presents a smooth surface to the elements. There is none of the coating of the steps of the lens with mud, rain, &c., that frequently occurs when these are placed on the outside.

THE "Roberts" Non-Skid Motor Tyre Tread Manufacturing Company, Ltd., of the Gripwell Works, St. Mary's Row, Birmingham, have issued a revised price list of their specialities. The firm also undertake repair work and supply studded leather bands, leather detachable non-skid bands, &c. Messrs. Roberts' "Gripwell" studded tyres are well known to motorists. The system adopted to secure the studs prevents their being pulled out in wear, and mention may also be made of the Fixquick detachable bands, made from the finest quality of chrome leather. The clips are made from special steel, coppered to prevent rusting, and fit closely into the rim or bead of tyre. Each band is fitted with a renewable tread, which when worn out can be replaced at a small cost. The list also describes and illustrates a compound high-pressure pump, by which it is claimed a man can obtain from 60 to 100 lbs. pressure with a minimum of effort; an automatic tyre tester, the "Peerless" jack, motor repair outfits, &c.

THE South Western Motor and Rubber Company, of 9, Royal Parade, Kew Gardens, S.W., the makers of "The Grip" non-skid, have purchased the sole British rights in a new emergency motor tyre patch known as the "Marles." It is intended for use with covers in which bursts, more or less large, have developed. The patch, which is interposed between the inner tube and the cover, is made of round or oval shape; it consists of specially prepared canvas in which a large number of short pins have been inserted, the heads of the latter being well protected. By fixing it between the tube and cover, the air pressure causes the patch, through the agency of the pins, to grip the cover and so hold itself in position without any solution or vulcanising being necessary. The patches are made in various sizes, from 2 in. in diameter to 7 in. by 9 in.; they can be supplied singly or in sets of three, and, in view of their utility and the small space they occupy, motorists will find them a useful addition to the spares carried on the car, and so be prepared to meet unexpected tyre troubles.

CONTINENTAL NOTES.

A Trial of Light Delivery Vans.

The "Auto" of Paris, in conjunction with "Le Poids Lourd," proposes to organise early this year a reliability trial of delivery vans for loads of from 8 to 24 cwt.

An "Elastic" Wheel Competition.

The "Auto" has issued the rules for the spring and elastic wheel competition it proposes to hold in France from the 7th to the 17th April next. The vehicles to which the wheels are fitted

The novel Motor-Bus in service between Dusseldorf and the suburb of Hamm, Germany.

The chassis is a 28-h.p. German Daimler, and the body, which, as will be seen, resembles that of a tramcar, is divided into two compartments for smokers and non-smokers respectively. The vehicle is lighted internally and externally electrically off a battery of accumulators carried under the driver's seat.

will be divided into five categories as follows:—Class 1, single-cylinder vehicles up to 100 mm. bore; two-cylinder ditto, up to 80 mm. bore, and four-cylinder ditto, up to 65 mm. Class 2, four-cylinder cars up to 85 mm. bore. Class 3, ditto, up to 100 mm., and six-cylinder vehicles up to 85 mm. Class 4, four-cylinder cars up to 125 mm. bore and six-cylinder ditto up to 105 mm. Class 5, four-cylinder vehicles up to 125 mm., and six-cylinder ditto up to 105 mm. The minimum weight of the cars in running order, and including passengers in the different classes, must be respectively 750 kilog., 1,000 kilog., 1,250 kilog., 1,500 kilog., and 1,750 kilog. The rules provide that shock absorbers must not be used in conjunction with the springs. Each class will be divided into two sections:—(a) in which no repairs and replacements of wheels or tyres can be made, and (b) in which they will be permitted in those cases where the reservation has been provided for in the entry form. The trial will consist of a run from Paris to Nice and back, a total of 2,100 kilometres, and will comprise eight daily trips of from 200 to 326 kilometres, two days being devoted to an exhibition at Nice, the final day being similarly spent in Paris. The entry fee is £8 per vehicle, the list closing on the 31st March next.

The Brussels Motor Car Show.

The annual motor-car exhibition in the Palais du Cinquantenaire, Brussels, which opened on the 21st ult., has proved so successful that it is being continued until the 5th inst.—three days longer than at first intended. Belgian motor-car builders are, of course, well to the fore, the vehicles on view comprising the Metallurgique, Auto-Mixte, Bovy-Dheyne, Imperia, Dasse, Fonds, Germain, Royal Star, Linon, Minerva, Nagant, Pipe, U.S.B., Vivinus, and Springuel, the last-named being an entirely new vehicle. The French industry is also well represented by Clement-Bayard, Berliet, De Dietrich, Unic, Brasier, Panhard, De Dion, Delahaye, Delaunay-Belleville, Clesse, Hotchkiss, Peugeot, Charron, and Brillic. From Italy come the Isotta.

Fraschini, Fiat, Itala, Hisa, and Lancia cars. Germany sends the Mercedes, N.A.G., Stöwer, and Bussing, while American vehicles are represented by the Ford.

The Motor Movement in Bulgaria.

According to a Consular report the roads and bridges throughout Bulgaria are being improved and repaired, and a profitable field for British enterprise presents itself in the development of the motor industry. Motor-omnibus services are being established with native capital in various parts of the country for the conveyance of passengers and goods from railway stations to outlying towns, and the omnibuses hitherto purchased for these services are said to be of German or Austro-Hungarian manufacture. The Government, too, is keenly interested in the development of this departure, and a thoroughly organised motor service conveys the mails to and from the Sofia Railway Station. In this case the vehicles are for the most part of French make. A similar postal service is in contemplation in the chief Bulgarian towns, and also for the transport of Government mails to towns which are not yet connected by rail. A motor lorry—the first of its kind to make its appearance in the streets of the capital—is being used by a large pottery firm, and is said to be giving great satisfaction.

Miscellaneous Items.

... A motor-bus service has lately been started in the town of Burgos, Spain.—The Minerva Company has decided not to take part in the 1908 Grand Prix race.—The Renault motor-cabs in service in Paris are about to be provided with a hood over the driver's seat for use in bad weather.—The Dowager Queen Margherita of Italy has just sold all her horses and carriages and transformed her stables for use by motor-cars only.—The death is announced of Comte Van der Straeten-Ponthoz, one of the founders of the Belgian Automobile Club; the deceased, who was ninety-four years of age, was an enthusiastic motorist.—A company has just been formed in Antwerp with the title La Société Anversoise pour la Camionnage Automobile, to start a new motor-lorry service in that city.—The Auto-

During the German Emperor's recent visit to this country he attended the Priory Church, Christchurch. The photograph reproduced shows His Majesty about to enter his Daimler Car after attending the Church on the 1st ult.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

DEFINITION OF A TOURING CAR FOR COMPETITIONS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—On examination of the list of touring car standards as fixed by the S.M.M. and T. in conjunction with the expert committee of the R.A.C., we regret to find that, at least as regards the smaller type of car, the standards as at present fixed entirely cut out several well-known standard two-seated cars which have proved their worth in open long distance reliability trials and hill-climbs. As an example, we may cite the 8-h.p. Phoenix two seater. On engine dimensions it is not eligible for Class 1, which is limited to 6.4, and on weight it is not eligible for Class 2. The full weight of the car, including passengers, spares, luggage, &c., is practically 12 cwt., and, therefore, is prohibited from competing in Class 2 for the reason that cars in this class must scale not less than 17 cwt.

When the 8-h.p. Phoenix was designed, weight was kept within reasonable limits, the object in view being a two-seater, light on tyres, and cheap in upkeep, yet of sufficient power to prevent continual recourse to the speed change lever. In actual price forty-eight miles' running can be had out of a gallon of petrol, and an average of twenty miles an hour can be maintained all day, and there is no getting away from the fact that such a small car is desired by many. We are in agreement that standards should be fixed that will prevent

Mr. Charles Jarrott on his new 120-h.p. De Dietrich Racing Car. The photo was taken at Brooklands Track, where Mr. Jarrott had been trying the speed of the vehicle, some very fast circuits being made.

a freak car being built capable of scoring in a particular competition, but if the published standard be adhered to the Phoenix and other well-known light cars will be prevented from taking part in the forthcoming 2,000 miles trial.

It is stated that the definition generally is designed to leave as much latitude as possible to the makers, and at the same time admitting the majority of standard cars without alteration, but in several no alteration less than the adding of many hundreds of pounds of dead weight will allow those cars to come within any class. It was doubtless considered in drawing up the table that a car of a certain power may be regarded as being of a certain weight, but here we can very well profit by the experience taught us by the evolution of the bicycle. A bicycle used to weigh more than four times what a good sound machine now turns the scale at. Experience and research have brought the machine to its present form, strong enough for any work and yet light—a result which would undoubtedly have been delayed for years had a minimum weight been fixed by some authoritative body when the machine was put to the test.

It is to be hoped that the S.M.M. and T. and the R.A.C. will reconsider this matter as applying to light cars. There is certainly every justification for their so doing.—Yours truly,

PHENIX MOTORS, LTD.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have very carefully read and considered a pamphlet containing a résumé of work of sub-committees on the above subject, together with the chart published by the the Society of Motor Manu-

facturers and Traders with reference thereto. We desire to direct your attention to views which we hold upon the 1908 International Motor Contest; they are as follows:—

(1) The sub-committee are reported to have carefully considered the question of classifying the said contest by price, and have come to the conclusion that such classification would be impracticable, because "there might be in one class two cars widely separate so far as horse-power is concerned, e.g., a car (A) 50-h.p.; car (B) 30-h.p., and the chassis price in each case £850."

The above appears to be the only attempt at an explanation why price classification, upon the basis of which the phenomenally successful Irish and Scottish trials have been hitherto conducted, has been abandoned. Put into business terms, it would seem that because the manufacturer of B car gives the public for the same money less horse-power than the manufacturer of A car the whole industry must be handicapped for fear of hurting the feelings of the manufacturer of B car.

We believe that it is granted that all business is conducted and maintained successfully because of competition, or in other words, that the manufacturer of any commodity, whether pins or automobiles, commands the largest market who gives the best value for the lowest price. If it should be contended that the manufacturer of A car, because he gives 20-h.p. more in his vehicle, is giving an inferior vehicle to the public for the same money, then surely it is the first object of the proposed 2,000-mile trials to expose that manufacturer, and if it will not do so, the only reason for organising the trials is immediately negated. Doubtless every entrant in the proposed trials will have as an ulterior motive the desire to prove by public demonstration that his car is the most reliable or speediest, and successful competitors will "use" their success solely for the purpose of attracting purchasers for their cars.

We believe it is an axiom that the governing factor in the purchase of every commodity, including automobiles, is that of price, consequently, if the proposed trials are to be of service to manufacturers, or afford evidence to the probable purchasers of automobiles, they should be subjected to the same governing factor. Moreover, in ignoring price may it not be suggested that the legitimate and laudable competition to produce the best car at the lowest price is being deliberately stifled? We therefore submit that on the question of classification by price the committee's decision is inflicting an improper handicap upon the industry without adequate reason; such handicap being so prohibitive that it amounts to positive exclusion of a number of well-known and popular cars.

(2) Having declined classification by price, the joint committee have substituted classification according to the R.A.C. Rating Formula.

We do not think there is anything which we can say on the subject of this formula which will aid to the general condemnation of the same, which has been published from time to time since the said formula was invented, except that when it was first published its use was merely suggested for purposes of general comparison (*vide* circular letter of the society dated November 9th, 1906), and the said formula has been usually defended on the ground that it was merely a rough and ready method of making comparisons between various engines. That it should now be adopted officially as an exact and reliable basis of rating entails consequences which are disastrous indeed.

(3) Coupled with rating according to the said formula, the committee have laid down an arbitrary rule as to seating capacity, which, briefly put, means that every car having an engine giving more than 12-h.p. R.A.C. rating shall carry four passengers. In other words, this means that any manufacturer who attempts to give the public a standard two-seated car with anything greater than a one or two cylinder engine is to be tabooed and, so far as the club and society can control matters, shut out of the industry.

(4) The committee also include an arbitrary rule as to the weight of vehicles fitted with engines classified as above. We do not understand upon what logical basis these arbitrary weights have been calculated—e.g., Class 1 permits of an engine with maximum horse-power 6.4 and compels such vehicles to weigh complete with passengers 13 cwt.; two passengers averaging 12 st. each absorb 3 cwt., therefore the 6-h.p. vehicle has to weigh or, if it does not weigh, has to carry ballast to make it weigh half a ton. Class 10, which permits of a 60-h.p. engine—that is, an engine ten times as powerful—has to carry only four people instead of, logically, twenty people; it has to weigh exclusive of passengers, on the above-mentioned basis, only 34 cwt. instead of, logically, 5 tons. We recognise that it may be contended that an engine rated at 60 h.p. is fitted for the purposes of speed, which is not expected from the 6-h.p. engine; surely there should be something wrong about such a contention if advanced on behalf of the governing body in the automobile business of Great Britain when the legal speed limit is twenty miles per hour and the said chart has been specifically prepared to apply to "touring cars."

If, in the proposed trial, the 6-h.p. car will not show up an average speed very near to the legal limit it will not stand any chance of success, nor incidentally would it be bought by the public, however successful it was in the competition; consequently when the com-

mittee invent arbitrary handicaps, it is incumbent upon them to handicap pro rata for increasing horse-power, and to make no allowance for potential transgression of the law. We respectfully submit, moreover, that the whole question of fixing an arbitrary minimum weight, except minimum weight of load carried, is theoretically and practically wrong, and contrary to the best evidence of all past experience. There are a large number of gentlemen engaged in the automobile world to-day who were ten years ago leading lights in the cycle business. Moreover, quite a number of our leading motor builders to-day are old cycle manufacturers. Consequently, a reference to the evolution of the present-day bit of perfect mechanism known as the bicycle is surely not out of place, and should help in the evolution of a perfect automobile. Cycle racing and cycle reliability competitions were extremely popular in that state of the cycle industry which may be fairly compared with the existing state of the motor trade. Would it be impertinent to ask what would have been said by such prominent firms of bicycle builders as Humber, Swift, Singer, Rover or Rudge if the N.C.U. had stipulated that all competitors in, say, the Cuca Cup twenty-four hours race were compelled to ride a bicycle weighing, say, 60 lbs. minimum, with a gear not higher than, say, fifty-six inches with wheels of certain limited dimensions, &c.? We would seriously ask whether the modern bicycle has not been evolved, and particularly has been proved a safe vehicle of light weight, owing to the fact that no such restrictions were imposed in the cycle competitions.

It is, of course, admitted that automobiles can be built too light, but the whole object of the proposed 2,000-mile trial is to eliminate badly designed and badly constructed cars, and unless the competition can be relied upon to weed out such vehicles, surely no system of arbitrary handicap will ever effect such a weeding process satisfactorily. Moreover, it is a sign of weakness from the competition point of view that it should be considered necessary to enforce arbitrary rules upon entrants. We submit that the popular demand at the present moment is that the society should organise a competition the result of which will show to the public which automobiles are the best, most reliable, and last, but not least, most economical both as to capital cost and cost of running. In the foregoing remarks we have endeavoured to deal with the subject generally. As you are aware, we are interested in the sale of a specific car, viz., the Ford, and when we state that upwards of 10,000 two-seated 15-h.p. four-cylinder Ford cars have been sold, we believe you will recognise that the car is not only standard, but a popular one. The bore of the engine fitted to the Ford car above mentioned is 3½ in., showing 22½ h.p. R.A.C. rating. The weight of the car complete with two-seated body (standard model) is 10 cwt. The above particulars are absolutely standard and apply to 10,000 Ford cars in use at the present moment. In order to compete in the Scottish trials last year we fitted a four-seated body to the standard two-seated chassis; the weight of the complete car with the four-seated body, lamps, tools, &c., as officially recorded by the S.A.C., was 11 cwt. 1 qr. 13 lbs. If it is assumed that four passengers averaged 12 st. each they would weigh 6 cwt., and allowing a further 1 cwt. for luggage, the total weight of the car would then have been 18 cwt. 1 qr. 13 lb. or more than 9 cwt. lighter than the standard minimum weight now suggested by the committee. Moreover, the above figures are strengthened when we state that the car which competed in Scotland as a four-seater was a standard two-seater, and should have been allowed to have competed as it was sold, i.e. total weight with two passengers and luggage 12½ cwt. That the Ford car is not too light has been proved over and over again until it has now become a recognised fact.

Consideration of the above facts will lead to a realisation of how hardly the proposed classification of "standard touring cars" will handicap the Ford car. We recognise the R.A.C. and the S.M.M.T. as the governing bodies of the sport and business of automobilism in Great Britain, and have no keener desire than to be loyal subjects to these bodies. We submit that if a car is designed to carry a given number of passengers, it should be compelled to carry that number together with any reasonable weight of baggage which may be considered necessary, but we are strongly of the opinion that it is theoretically as well as practically wrong to exclude the popular product of a manufacturer from competitions because the manufacturer has discovered that automobiles have hitherto carried a good deal of surplus and unnecessary weight.

We are content to abide by the result of the competition—that is to say, if a car is badly designed, of bad material or workmanship, or too lightly constructed, that the extraordinary test of a 2,000-mile trial should make public demonstration of such defects. On the contrary, if a car weighing less than one-half of the standard minimum weight can go through the strenuous ordeal of the proposed trial, then surely the committee will have demonstrated that current ideas as to the necessary weight of a chassis are wrong, manufacturers will have gained valuable experience, and the public be saved from having in future to pay for surplus and unnecessary "scrap iron" in their automobiles. That lightness is an essential feature in automobile construction must surely be admitted when it is considered that petrol consumption and tyre upkeep are largely governed by weight.

—Yours truly,
PERRY, THORNTON, AND SCHREIBER, LTD.

THE CHEAPEST MOTOR-CAB.

To the Editor of *The Motor-Car Journal*.

SIR,—We have recently noticed some correspondence and discussion in the motor Press, and the claims of a certain company to the effect

that they produce the cheapest motor-cab on the market. It appears to us that there is no great kudos attached to producing the cheapest article in any trade, unless the manufacturer can at the same time claim and prove equal if not superior qualities to those possessed by the more expensive article. It also does not necessarily follow, because a firm of reputation is producing a satisfactory cab, that another firm of more recent origin cannot and does not produce an equally satisfactory and reliable vehicle at a cheaper figure.

We are living in an age of rapid advancement, and improvements in motor-cars of every description, and have by no means reached that state of perfection and standardization that some firms would have us believe. We have recently visited the Olympia, Paris, Berlin, and Brussels Motor-Car Exhibitions, and have made a study of the various cab chassis and transmissions exhibited. After exhaustive trials of almost every build catering for this particular branch of the industry we have arrived at the conclusion that the great majority are unnecessarily complicated, and therefore equally unnecessarily costly to produce and maintain in good repair. We have, therefore, adopted the simplest of all the systems exhibited, and have placed a large contract for early delivery in 1908 with the Deutsche Motor Fahrzeug Fabrik, of Berlin, whose exclusive selling and manufacturing rights we have obtained for the United Kingdom of Great Britain and Ireland, its colonies and dependencies. These cabs are being specially constructed for us on the "Hornstein" patent friction disc system to our own specification, which has been drawn up to meet all the detail requirements of the Scotland Yard authorities.

The 10-12-h.p. two-cylinder water-cooled engine is fitted with high tension magneto and coil and accumulator ignitions. On the crankshaft is fixed a large metal disc which acts as a flywheel. A leather-faced

The Christmas Card issued by Messrs. J. E. Hutton and Co., Ltd., to their Clients.

As will be seen, it is particularly up-to-date, representing as it does a Berliet car pounding through the floods which have recently been so prevalent.

wheel placed at right angles conveys the drive from the metal disc direct from the propelling shaft to the rear live axle. A hand lever is used to slide the driving wheel over on the propelling shaft to and from the centre to the periphery of the disc, as the speed is required to be changed, and a direct drive is obtained at all speeds, forward and reverse. There is also fitted a foot pedal by means of which the contact between the friction wheels is broken and either the car or engine can be run free. Ball bearings are used throughout, and owing to the simplicity of construction and the entire elimination of gear-box and other unnecessary mechanical parts, great efficiency is obtained, and in consequence the fuel consumption is very low.

At the moment we do not propose to make any definite claims, but we have every confidence in stating that we will prove our cab to be equally satisfactory to any at present in use in this country, and when this has been proved we shall be in a position to supply not only the cheapest, but one of the most efficient and most reliable motor-cabs on the market.—Yours truly,

C. GRAHAME-WHITE AND CO.

LOW TENSION MAGNETO TROUBLES.

To the Editor of *The Motor-Car Journal*.

SIR,—I have the same kind of trouble with a Richard-Brasier car as your correspondents "Frank" and E. J. Watts. Will the latter kindly explain what he means by the "trip rod"? My car is of the 1905 type and has nothing connected with the ignition which corresponds to this name. Does he mean the lifter makes contact with the tappet rod, or that the tappet rod makes contact with the spindle at the wrong time? I would be much obliged if he would more fully explain, and

perhaps give a diagram of what occurs. My car runs at times as well as ever it did, and then suddenly dies away. When the engine runs fast the car goes all right, but will not face a hill as it should, and will not pick up after slowing down. This has gone on for weeks, no matter how I change the tappets and plugs, always turning the engine exactly by the marks on the fly-wheel. I have had the carburettor down several times and tried everything I can think of.—Yours truly,

TALLY-HO.

THE RELIABILITY OF MAGNETOS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing in the last number of the *M.C.J.* a query by a correspondent who signs himself A. W. R. in regard to reliability of magnetos, I should like to state that I have got the Simms-Bosch high-tension ignition fixed to my car, and I have run a little over 8,414 miles without adjustments of any kind.—Yours truly,

D. YOUNG.

WANT OF COURTESY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an instance of how not to behave when motoring I give the following account. My three little children with their nurse had taken a favourite old spaniel for a walk last Bank Holiday. When near the bottom of the Golf Club Hill, Crowborough, a motor-car came down the hill and ran over and killed the old dog. After continuing a short way the vehicle was stopped and the chauffeur descended. My eldest boy, aged 9, ran after the car "to take their name and address," as he

The 8-10-h.p. Talbot Car, belonging to Mr. W. Beere, of Bendigo, Australia, which has been in use for two years and two months and still goes as well as when first purchased.

afterwards told me. When he was seen approaching the gentleman, the only other occupant of the car, and the chauffeur hurriedly drove off. A lady who was passing at the time driving a carriage most kindly conveyed the remains home. I am a motorist myself and have been driving cars since 1896, and know full well the danger of suddenly swerving when travelling fast in order to avoid a dog or other animal. But I think common courtesy demands an apology in a case of this kind. It may be a satisfaction for this particular driver, whose number I send you, to know that he killed the dog outright. A word of advice to him, "Do not always run away unless you are quite sure that there is no one to take your number."—Yours truly,

R. S. K. E.

AN OPTICAL ILLUSION?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In giving his version of this phenomenon, Mr. Herbert J. Chapman criticises the statement made in your issue of December 14th that a (motor-car) wheel may be considered as a series of levers of the second order. Now nothing was said about the power being applied at the top of the wheel, or that the levers in question were constituted by two diametrically-opposite spokes, although Mr. Chapman appears to have so mis-read the reply. He is further in error in stating that the power is applied at the centre of the wheel, as in a motor-car this is not the case, for, no matter whether the drive is by cardan or chain, the force is exerted at a point corresponding with the pitch line of the bevel wheel or sprocket as the case may be.

He next remarks that he has heard before that the top spokes travel faster than the bottom ones, but does not agree with it. This

is on a par with those argumentative people who declare that the earth is flat. Regarding his subsequent remark that the top of the tyre travels faster than the bottom owing to weight deflection, this can only be in relation to that section of the tyre in contact with the ground, and does not in the least affect the truth of the statement that the top spokes travel faster than the lower ones, or the top of the tyre (considered as a whole) travels faster than the bottom, independently of any question of weight deflection. Again as to horse-drawn carriages, in which Mr. Chapman says the phenomenon is not observable, here, although it is true there is no differential, any swaying of the vehicle will allow the wheels to vary their relative speed as required, seeing that each wheel is independent of the other.—Yours truly,

APPRENTICE.

MAGNETO TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am pleased to say that the trouble which was causing the misfiring on a Brasier four-cylinder 12-16-h.p. car has been traced to the carburettor, as stated in your useful paper of the 21st ult., also, lack of compression in rear cylinders, due, presumably, to the piston rings being half worn out, owing to inadequate lubrication.—Yours truly,

FRANK.

A "KNOCKING" QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would explain the possible cause for the knocking trouble outlined below. The car runs perfectly for ten miles, and without any change in the character of the road and without altering the position of the ignition lever suddenly "knocks" furiously. The trouble is relieved by retarding the spark, and the motor runs as usual for another five miles, when it misbehaves in the same way.—Yours truly,

J. ASHHURST.

[The knocking is probably due to pre-ignition from carbon in the cylinder or from over-heating of some internal part. The inside of the cylinder will reach its maximum temperature when the engine has been "pulling" heavily for a considerable period at a time.]

SURREY AND LICENCES.

To THE EDITOR OF *The Motor Car Journal*.

SIR,—The Surrey County Council are once more endeavouring to get residents who pay licences for armorial bearings, carriages, motor-cars, motor-bicycles, dogs, guns, and male servants, to pay their duties in the county of Surrey. May I express the hope that motorists, sportsmen, and all people who are actuated by a sense of fair play be particular and take out their licences in any county but Surrey, as this is undoubtedly the most police trap ridden county in the whole of the kingdom? The traps are not worked to protect the public, but simply to collect the fines, whilst as to the benches of magistrates it is only necessary to point to Kingston, Guildford, Reigate and Epsom to see it is hopeless for any motorist to expect a fair hearing. Therefore I say, pay your licence duties in any county but Surrey.—Yours truly,

J. CROW.

We have an inquiry for the maker of the "Fulminator" two-cylinder coil; also one for the manufacturer of a mica wind screen.

At the moment of going to press we received an important letter from a northern correspondent on the organisation of motorists, which will have publicity in our next issue.

We are asked to state that the Westminster Motor Car Garage, of 174, Kensington Place, Westminster, S.W., the Westminster Bridge Motor Garage, Westminster Bridge Road, S.E., and the Westminster Motor Works, Ltd., 45, Horseferry Road, S.W., have no connection with each other.

THE LONDON AND PARISIAN MOTOR COMPANY, LTD., write:—"On December 23rd our premises at 87, Davies Street, W., were entered between 4 p.m. and 6 p.m. and a silver cup won by a 14-h.p. Vulcan at the Blackpool 1906 race meeting was stolen. The strange part of the theft was that a larger and more valuable cup won by the same car was left behind. Both were standing on a table in the showrooms. We should be obliged if you would give publicity to the above, so that you, through your valuable medium, may help us to recover the trophy, which is inscribed 'First Prize for Standing Mile, won by 14-h.p. Vulcan, Blackpool Races, 1906.'"

MESSRS. SHIPPEY BROS., 13 and 14, King Street, Cheapside, London, E.C., write with reference to their importation of American motor-cars that their object in approaching a financier on the subject was as follows:—(a) The employment of English chauffeurs to run these cars on our behalf; (b) To give English engineers repair work on all cars imported, as we have always done on the large number of American cars hitherto sold by us in this country; (c) To utilise British capital to profitable advantage in a safe paying business for all concerned; (d) And above all to check the flow of many systems of Continental cars to work which the importers also import continental labour to drive and repair them.

THE SCIENTIFIC TIMING OF MOTOR RACES.*

In a motor race having two or more competitors accuracy of timing is not of prime importance, unless a record is established, for the contest is won on place and not on time, and place is easily determined by the eye of the judges without regard to the timing system. There is room for error, however, even in placing the finishers in a close race between half-a-dozen or more contestants. But it is in record breaking attempts and in hill-climbing trials, which are decided solely on time, that scientific accuracy is required. The watches generally used for timing automobile events and horse races cannot indicate any divisions of time shorter than one-fifth of a second. This interval is much too long for the purpose, as a race can be won or lost or a record broken by a smaller period of time. The mile record, established in January, 1906, on the Ormond-Daytona course, is 28 1-5 sec., which represents a speed of more than 187 feet a second. At such tremendous speed a car travels very close to 37½ feet in one-fifth of a second, or fully 2½ car lengths. Now if two cars were coming down the beach together in a competition trial so great a difference as this would be apparent to the judges or timers, and the second car would be timed at 28 2-5, but if the same cars made separate trials against time they might be tied at 28 1-5 sec.

Most watches are not accurate even to one-fifth of a second; the movement has not a continuous, progressive motion, the escapement wheel revolves by a succession of starts and stops, making two stops for each beat of the balance, just as some large tower clocks count off the minutes by the abrupt passage of the minute-hand from one mark to the next. If the stem of the stop-watch were pressed immediately after the escapement wheel had moved the time would be caught correctly, but should the stop not be pressed until the balance had almost completed its swing to release the wheel for the next stop, nearly a fifth of a second would be lost, and a car that had actually covered the mile in, say, 28 19-100 sec. might be "clocked" in 28 sec. dead. Besides this factor of inaccuracy, or mechanical inadequacy, in the stop-watch, there is the human element to be taken into account. This may introduce a serious error, according to conditions. Some men are more adept at operating a stop-watch than others; some are alert and quick of movement, while others are sluggish, so that a measurable time may elapse between the instants that three timers will press the stops on their watches for a given car as it crosses the tape. Unless the men who hold the watches are very expert, there is probability of error in determining the instant that the front wheels actually cross the tape.

Further liability of error exists in the ordinary methods of signalling the start and finish of the event. This is usually done by the firing of a pistol or a similar means. In the case of any manually-operated system some time is consumed in the transmission to the brain of the impression received on the eye. This interval will vary with different persons, just as the period required by the timekeepers to catch the impression of the signal and actuate the stop-watches will differ. If the start and finish are both in sight, and the timers take the time by vision in each case, the error will be nearly constant and the time accurate. It is particularly difficult to time hill-climbing contests by the old method when the starting point is not in sight from the finishing line. When the dropping of handkerchiefs or flags by four or five men stationed at turns is depended upon to signal the instant of start from the base to the top, the element of human error is greatly magnified. It should be evident from the foregoing that far greater accuracy is required in timing motor-car events to obtain indisputable results than has prevailed hitherto.

Next to flight of a projectile, the speed of a racing automobile is the fastest terrestrial movement that we are called upon to measure with precision, yet in one case instruments are used that determine the rate even to the 1-1,000 part of a second, while in the other the only method that is officially recognised in America is the use of stop-watches that cannot measure time to less than the fifth part of a second. The inaccuracies and unsatisfactory nature of the timing of automobile events by the stop-watches manually operated were recognised years ago in France and England. The Automobile Club of France offered a prize of 1,000 francs for the invention of a device that would satisfactorily time motor events automatically. This prize was won by M. Mors, whose instrument was used in some of the earlier trials against time in the United States. It consists in an adaptation of the recording chronometer as used in observatories, with means for automatically registering the passage of a car across the starting and finishing lines. The record is traced by a pen on a strip of paper that is unwound by clockwork. The record can be measured to the hundredth part of a second, and the personal equation is entirely eliminated. It was in the same year that the automatic timing apparatus devised by the author was perfected, patent applications being filed in June, 1904. This complete apparatus has three distinct functions: first, to time the event by starting and stopping split-second watches and moving the pen of a registering chronometer; second, to signal the start and finish by firing a gun; and, third, to provide telephonic communication all along the course. The problems involved are many, as will be understood from the foregoing summary of various timing methods in use and from the following explanation of the McMurtry system.

In order to present the matter more clearly, we will consider the telephone system and timing mechanism separately. The operator at the finish and the man at each intermediate station are in communica-

tion with each other during every instant of a race by means of the wires used also for operating the timing apparatus. Each operator is provided with a transmitter, attached to a metal breastplate strapped around the neck, and a receiver attached to spring-metal straps that fit over the head and hold the receiver to the ear. The transmitter is held in a movable bracket having a cam edge-contact plate, so that when the bell-shaped mouthpiece is pushed down away from the face the circuit is broken and cuts out the sound of the gong, so that the operator can hear anything said by the other men on the line. Spring plug sockets are screwed to the case of the timing apparatus, so that quick connection of the telephones with the wiring system can be made. The use of wire for talking does not interfere with the operation of the timing mechanism on the same wires, as the telephones are provided with condensers which make this dual operation possible simultaneously. In addition to the operator's telephone, there is also a special patrolman's telephone; this is a small, portable affair, hung from a shoulder strap. It consists of a case containing an induction coil, with a trembler and condenser and a combined receiver and transmitter. The trembler is used for calling by giving a loud buzz in the receiver all along the line. With this instrument and a coil of wire, the patrolman can make a quick dash on a motor-cycle along the course to the scene of an accident or of trouble, throw one end of his wire over either line wire, stick the other end in the ground, and at once open communication with the operators at start and finish.

We may now proceed to a consideration of the means employed for closing the electric circuit when a car crosses the starting and finishing line. Various methods have been tried. One of the earliest was employed at the record trials of the Automobile Club of America, on the Coney Island Boulevard, on November 16th, 1901, when Henry Fournier established the world's mile record of 51 4-5 sec. Here the closing of the electric circuit merely rang gongs, by the sound of which the timekeepers started and stopped their watches. A rubber hose was laid across the course and connected with a diaphragm, so that when the air in the hose was compressed the pressure on the diaphragm closed the circuit. This proved unsuccessful, however, as it was found

Fig. 1.—Wiring Diagram of Open Circuit.

that the duration of compression as the wheels of a car passed over the hose was so short that the pressure communicated to the diaphragm was insufficient to close the circuit.

Finally, an automatic trap was devised that overcame all these defects. The trap consists of a flat, rectangular box, to the top of which is secured a spring scales registering up to 60 lbs. To one end of the scales is attached a short chain that passes over a metal pulley, having a reduction of one-half, and is connected with a wire strung across the course. The scales are merely intended for the purpose of determining the tension of the wire, which is usually drawn to a tension of fifteen pounds, indicated as thirty on the scale. Mounted on the end of the shaft of the reducing pulley is a trigger arm that can be tightened on the shaft by a set screw after the trigger has been set. Engaging with the lower end of this trigger arm is a spring-actuated lever that, when released, makes contact with a stationary contact post, and so closes the circuit to start the watches of the timing instrument. At the same time another lever is released that opens the circuit, after a given interval, by means of clockwork, so that the watches can be operated again when the first car reaches the first intermediate post or the finish.

We now come to the consideration of the actual time-indicating apparatus. In its complete form, as first used at the Florida beach meet in 1905, this was arranged to operate six split-second watches. A later form, used the following year, was built for only three watches, as the officials did not care for the intermediate times and the racing rules called for only three time-pieces. The original apparatus was also provided with an extra relay for operating a registering chronometer, but this was not used the following year, owing to the expense involved and the fact that, notwithstanding the chronometer would have given more accurate and permanent records of the events, the watches would have to be used any way, as there is no provision in the racing rules that allows timing by any other means than watches.

The six watches were set in a row on the panel and secured rigidly in position with clamp screws, so that the watches could be started and

*Abstract of paper read by Mr. A. L. McMurtry before the American Society of Automobile Engineers.

stopped by a set of plungers called "sweepers," acting on the stems, and the split hands operated by a set of smaller plungers, called "splitters," acting on the escapement knobs. By means of an automatic current-distributor, all six watches were started simultaneously when a car crossed the starting line. Then when it passed an intermediate station three of the splits were stopped to indicate the time for that distance. At the next intermediate point the second three splits were stopped and the first three reset, and so on automatically to the end of the event, when all six watches were stopped. Forward of each watch, below the panel, were magnets which, when energised, actuated the sweeps and splitters. Above the panel were two relays for closing the circuits through the battery and distributor.

Besides the apparatus and attachments already described, the mechanism was provided with a third relay for use in connection with a gun mounted on a standard in the timing stand for automatically signalling the start and finish of the race. The gun was a repeating shotgun, which had the stock and muzzle sawn off. After it had been fired it was merely necessary to move the grip to eject the discharged shell and load a fresh shell into the breech. Magnets were attached so that when energised from the batteries, through the relay on the panel by the closing of the circuit through the automatic trap, the trigger was depressed and the gun discharged at the same instant that the watches were started. A switch was provided for each relay and for the distributor. In addition, a milli-ammeter was secured to the panel, with a key to throw it in circuit, for determining the strength of the current at any time.

The wiring system of the timing apparatus is so arranged that by the movement of a single lever, operating several switches, the system can be changed from the open circuit to the loop system. The open circuit is the simpler and cheaper, requiring batteries at only one point. A diagram of this system is shown in Fig. 1. The arrangement is the

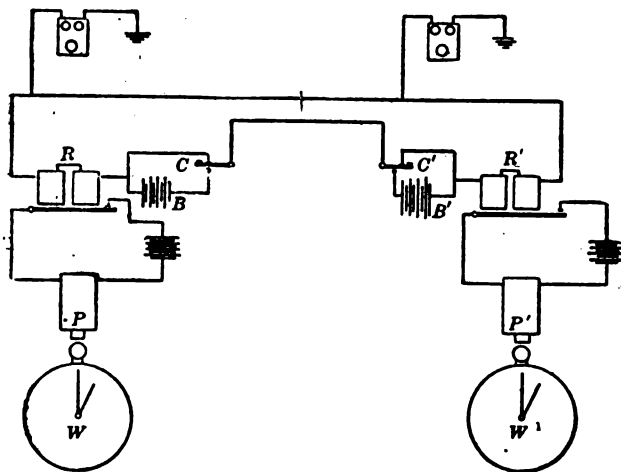

Fig. 2.—Loop System in the McMurtry Apparatus.

same as in an electric bell circuit having two push-buttons, a relay taking the place of the bell. When the circuit is closed at the starting point S, the relay R is also closed and the watch W is started through the action of a magnet M on the plunger. The same operation occurs when the circuit is closed at the finishing point F, when the action of the relay stops the watch. So it is only necessary to close the circuit at any point to operate the watches. Against the simplicity of the open circuit are the manifest disadvantages that timing instruments can be used at only one end of the line, and that a crossing of the wires at any point will close the circuit and perhaps put the entire system out of operation.

In the loop system, shown in Fig. 2, the upper and lower contacts are used so that when both keys C and C' are up the two relays R and R' are in the circuit. Upon pressing the key a line battery B or B' is inserted in the circuit, and this operates the plungers P or P' situated at start and finish, thereby operating the watches W and W'. With this system it is necessary to have a battery at each point where a telephone and timing key are to be placed. This is expensive and troublesome, but it has the advantage that as many instruments as desired can be used, and the line is protected against interference by outsiders or the accidental crossing of the wires, resulting in short-circuiting. By constructing the apparatus with the switch previously mentioned, it is possible to use either system as desired, without entailing any trouble in changing the wiring. There are condensers on the relays to prevent sparking, and external magnetism had to be guarded against to prevent magnetising the watches.

An important feature of the apparatus is its portability. In Florida the instruments at times had to be taken up and transported twenty miles before the tide came up. The traps had to be changed frequently for races at varying distances, as from the kilometre to the mile, in the shortest time. One such change, including a run of 62-100 of a mile, was made in seven minutes. There is, of course, a lag in the mechanical operation of the instruments, but this is a negligible

quantity, since the lag at one end is balanced by that at the other. It has been determined by experimentation, for example, that there is a lag of 1-20 of a second in the series of operations, including the depressing of the wire attached to the trap, releasing the trigger, closing the circuit, the mechanical operation of the relay, closing the local watch circuit, operating the watch plungers and starting or stopping the watches.

The purpose of this paper has been fulfilled by showing that accurate timing of automobile events is necessary, and that it is possible to time them to the precision of the 1-100 part of a second by absolutely automatic electrical and mechanical means whereby the personal equation and the shortcomings of the stop-watch are eliminated.

COMPANY NEWS:

PREMIER ACCUMULATOR COMPANY.—£25,000. To acquire the business carried on by A. Schanschiff and H. Stephens at Northampton as Premier Accumulator Company. Cattle Market Road, Northampton.

OLDHAM MOTOR COMPANY.—£5,000. As title. 36, Manchester Road, Oldham.

WINCHESTER MOTOR AND DEAN'S ENGINEERING COMPANY.—£15,000. To take over business of engineers and motor-car manufacturers and repairers, carried on by Mr. F. J. Dean, at Upper Broad Street, Winchester.

HARRY W. COX AND CO.—£5,000. To acquire business of electricians, engineers, &c., carried on by Harry W. Cox, Ltd., at 1A, Rosebery Avenue, E.C. 47, Gray's Inn Road, W.C.

T. TOWARD AND CO.—£18,000. To take over the business of engineers, boiler and tank builders, and the like, carried on by T. Toward and W. Toward at the St. Lawrence Ironworks, Ouseburn, Newcastle-on-Tyne, as T. Toward and Co.

A. VEDRINE AND CO.—The annual meeting of this company has been held in London. Moving the adoption of the report, the Chairman (Mr. M. Ulcoq) stated that the works at Courbevoie and Rouen had been greatly improved, and at the latter place they had turned out a number of taxi-cabs which had been seen in the streets of London and Paris. There was a net profit for the twelve months under review of £4,963, to which had to be added £6,900 brought forward from last year. Mr. Vedrine, the managing director, said that they had orders in hand for taxi-cabs larger by 500,000 francs than they had last year. On the first 100 cabs they had lost money, but this had been made up by the profit on the next 100, and now the contract price left them a satisfactory profit. They had made the bodies of most of the cabs on the London streets, nine-tenths of those in Paris, and some in New York, Monte Carlo, and Buenos Ayres. The report was adopted.

DARRACQ-SERPOLLET OMNIBUS COMPANY.—Presiding at the first ordinary meeting of the Darracq-Serpellet Omnibus Company, Mr. J. S. Smith-Winby said the report and accounts covered the period of the last sixteen months. It would not be a surprise for the shareholders, therefore, that at the first general meeting they were not able to announce the payment of a dividend, especially when account was taken of the difficult and exceptional circumstances with which they had to contend by the death of M. Serpillet, the inventor of the system. The completion of the new factory had been delayed for two months by bad weather, but it had now been equipped under the supervision of M. Darracq. The two great points upon which it was necessary for a manufacturer of these motor-buses to satisfy his customers were, firstly, reliability and efficiency; and, secondly, that in the hands of a customer they can be made to pay. The reliability and efficiency of the Darracq-Serpellet vehicles were coming to be admitted, as a result of trials during the past twelve months. The Metropolitan Steam Omnibus Company, which was running their vehicles, had proved a highly profitable venture, and the fleet would be increased, while orders had been received for almost all European countries and from India for steam omnibuses.

ENGBERT TYRES.—£10,000. To acquire from Warwick Wright and J. T. C. Moore-Brabazon the sole rights in the United Kingdom for the sale of Engelbert tyres, to lease a portion of the premises of Warwick Wright, Ltd., at 110, High Street, Marylebone. The owners of the tyre (Engelbert, Fils et Cie, of Liege) have stipulated that the company shall dispose of tyres to the value of £8,000 during 1908 and £12,000 during 1909, and in each succeeding year 20 per cent. increase on the stipulated sales for the previous year, up to a maximum of £20,000 per annum. 110, High Street, Marylebone.

N.S.U. MOTOR COMPANY.—£5,000. To adopt an agreement with the Neekarsulmer Fahrzeugwerke, A.G., of Neekarsulm, Wurtemberg, and to carry on the business of manufacturers and letters to hire of cycles, motors, &c. None. 78, Charlotte Street, W.

THE SCOTTISH MOTOR TRACTION COMPANY, LTD.—The annual general meeting of this company has been held at 49, Queen Street, Edinburgh, the Master of Polwarth, chairman of the company, presiding. The chairman moved the adoption of the report and that a dividend of 5 per cent., free of income tax, be paid for year to September 30th, 1907. Mr. Alexander J. Paterson, C.A., seconded. Mr. Jas. A. Hood, Rosewell, and Mr. Robert Craig Cowan, Penicuik, were re-elected directors on the motion of Provost Kerr, Loanhead; and Messrs. Richard Brown and Co., C.A., were re-elected auditors.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE old War Office in Pall Mall comes into the possession of the Royal A.C. on the 5th inst., on which date the ninety-nine years' lease will begin. The scheme for the new premises will probably take a couple of years to materialise, and it will be near the end of 1909 before the members will be able to use the house which is to be built upon the excellent site.

With reference to the R.A.C. scheme for the association of clubs, we understand the first provincial club to adopt the same is that of Nottinghamshire.

BROOKLANDS.

THE committee of the Brooklands A.R.C. have decided to hold three principal two-day meetings this year, viz., the Easter meeting, on April 18th and 20th; the Whitsun meeting, on June 6th and 8th; and the August meeting, on August 1st and 3rd. The remaining meetings will be one-day events and will take place on May 9th, July 4th, September 12th and October 3rd. In addition, there will be other events arranged by the Royal Automobile Club and affiliated clubs on the Brooklands motor course.

The Standard Class races will also be continued. Each of these (the 26-h.p., 40-h.p., 60-h.p. and 90-h.p. respectively) will be divided into short and long races, and at every meeting the four Standard Class races will be run, three of them over a short distance, and the fourth over a long distance. To avoid any one car proving a continuous winner in its respective Standard Class, the committee have decided that the winner of such a race shall be debarred from competing in the two subsequent Standard Class races of the same size and over the same distance; after having stood down for two races, such barred car will have the option of competing again in its Standard Class, or, should it waive this right, it will be eligible to compete in a so-called Standard Class Championship race held at the last meeting of the season. By this means it is hoped that new competitors will enter for each Standard Class race—the winners meeting for a final decisive struggle at the championship meeting.

In addition to Standard Class races, every race day will provide handicaps, in which cars will be handicapped by distance, and dimension races, that is to say, races in which the classification will constantly vary from one dimension to another, thus endeavouring to ensure that those cars which are not suited by the Standard Classes will at some time or another find races suitable to their engine dimensions.

SUSSEX COUNTY.

AT the December meeting of the committee of the Sussex County A.C., which was well attended, the controversy between the Royal A.C. and the M.U. formed the chief subject for consideration.

After the matter had been discussed at some length the following resolution was proposed and carried unanimously, viz.:—"That the Sussex County A.C. much regrets the precipitate action of the Royal A.C., and tender to the Motor Union its loyal and continued support."

IRISH.

THE committee of the Irish A.C. are pleased to announce that the Countess of Aberdeen has consented to accompany the Lord Lieutenant on the occasion of the opening of the Dublin Motor Show to-day (Saturday).

THE Welsh A.C. has decided to give continued support to the M.U.

LIABILITY OF LOCAL AUTHORITY AS TO STATE OF ROADS.

THE record has been closed at Elgin in an action at the instance of Basil Iles, electrical engineer, West Malvern, and Mrs. Iles against the County Council of Elgin. Mr. Iles claims £300, and Mrs. Iles £250, with £50 for expenses, for injuries sustained by Mr. Iles and damage to a motor-car, which met with an accident owing to the alleged faulty and negligent manner in which the road in the neighbourhood of Dunain Bridge had been widened. On July 8th he drove his wife and three friends to Elgin. They were returning home by the road leading through Grantown to Nethybridge via Dunain Bridge. On the north side of the road there is a narrow turf verge, and immediately beyond that a ditch terminating where the road curves in a culvert. On approaching this point Mr. Iles steered his car to the right-hand side of the road in order to pass two cyclists travelling in the same direction as himself. He had a view of the road beyond the curve and saw that it was clear. When the car reached a point a few yards short of the culvert, the inside wheels, which were about four feet from the edge of the road, suddenly began to sink into the surface of the road, which had been recently widened. They sank so deeply as to render it impossible for Mr. Iles to steer the car away from the ditch, and it ran into the covering of the culvert. Mrs. Iles, who was sitting beside her husband, was thrown from her seat by the shock, and her head struck the glass wind screen with such violence as to completely smash the screen. She

was severely injured, being much bruised and badly cut about the face and head. The car was also seriously damaged by the accident. The County Council deny liability, and contend that the accident was due to the pursuer's recklessly driving his car at an excessive speed on the side of the road, which was then in a very wet state owing to a severe rainstorm. They also contend that the pursuer had not proper control of the car. The settlement of this case is given in our "Comments" on another page.

RULES AND COURTESIES OF THE ROAD.

THE General Committee of the Motor Union has adopted a series of suggestions with regard to the behaviour of motorists and others on the road, which has been prepared by its Signs and Notices Committee as follows:—

TAKING CORNERS.—A corner should not be cut close on the right or "off" side, but it is especially dangerous to take a corner on the wrong side when it cannot be seen that the road is clear; therefore, in taking blind corners to the right hand, always keep to the extreme left or "near" side, no matter how much slowing down this may involve.

MAIN ROAD TRAFFIC has the priority; therefore when entering a main road from a side road always do so at a slow pace.

SIGNALS.—When about to alter speed or direction the following indications should be given:—

(a) Stopping or slowing down: the driver's right arm extended horizontally from the shoulder, with the fore arm held up vertically.

(b) A turn to the right: his right arm fully extended.

(c) A turn to the left: the left arm similarly extended.

The Pope-Toledo Touring Diligence shown at the recent Exhibition in New York.

On no account should the driver extend his right arm when a turn is to be made to the left; nor should any passenger extend his left arm when a turn is going to be made to the right.

The right hand held downwards by the side of the car and waved forwards gives a useful signal that following traffic may pass.

It is well to make these signals habitually, whether there is traffic or not. It is often quite as important to communicate any change of direction or speed to persons in front of you as to those behind. A signal should also be given at a facing junction of forked roads so as to indicate which road is to be taken.

MEETING OR OVERTAKING.—All traffic should be met or overtaken on its proper side, and as much room as possible should be given to bicycles. Whenever conveniently possible, motor drivers should keep their right-hand or "off" side wheels near to the centre of the road. On approaching a bridge with a sharp rise keep well to the left or "near" side of the road.

Avoid passing another vehicle at any bend of the road, or at a cross road. When about to pass a vehicle going the same way as yourself, if a third vehicle is nearly approaching from the opposite direction, let the latter pass you first, before you overtake the former.

When passing a man riding in charge of two horses, keep, if possible, on the side furthest from the led horse.

When overtaking another vehicle, especially a motor-car, be certain that your presence is recognised before attempting to pass.

IN TRAFFIC, keep a reasonable distance from the vehicle in front. **IN DESCENDING HILLS** give way to ascending traffic.

THE HORN OR BELL should be used with discrimination, each signal having its own special purpose; and sounded not more loudly, nor more frequently, than is quite necessary.

WHEN PULLING-UP OR STOPPING, do so in a suitable and convenient place. Never stop near a corner. Always be prepared for any emergency, and always stop in case of accident.

THE UNITED MOTOR INDUSTRIES, LTD., are supplying the Nonex fire preventive devices to the motor trade.

CASES UNDER THE MOTOR CAR ACT.

A QUESTION OF JURISDICTION.

An interesting point of law was involved in a case which the Bray magistrates struck out for want of jurisdiction, and in which District Inspector Triscott charged Mr. Ebbenstein, of Dublin, with having, by negligence in the management of a motor-car, caused injury to Patrick Kelly at Bray. At a previous hearing of the case, Mr. James O'Connor, who appeared for defendant, argued that, as an administrative county intervened between where the offence occurred and where defendant resided the magistrates had no jurisdiction in the case. Mr. Triscott relied on the point that since defendant was before the Court both personally and by his counsel he could not argue a want of jurisdiction on the part of the magistrates to summon him there; but Mr. O'Connor said that both defendant and himself attended on the last Court day out of respect to the Bench to point out to them their want of jurisdiction, and to inform the Court that they appeared under protest.

Mr. Meldon, R.M., in delivering the judgment of the Court, said that the very important question involved in the case—namely, whether a summons to appear before a petty sessions court could be served outside the county and not in the adjoining county—had been determined in the case of *Leyden v. the G.S. and W. Railway Company* by a court composed of nine judges, restricting the service of summonses to the county and the adjoining county. That seemed somewhat anomalous from the fact that in certain defined cases of road nuisances, offences by owners of carts and cars, and those appertaining to rules of the road, power was expressly given to summon offenders before justices of the petty sessions district in which the offence had been committed. Thus a carriage owner may be summoned to that sessions for furious driving in that district, but a motor owner may not be so summoned under the Motor Acts.

THE MUD ON A CAR.

At Denton, Percy Day, chauffeur to Mr. George Ollerenshaw, of Highfield House, Glossop, was summoned for failing to carry a light at the rear of his motor-car by which the identification marks could be discerned. It was stated that the night was very wet, and the lamp at the rear of the car, although burning perfectly, was covered with mud to such an extent that the light was invisible. Dr. Eastham contended that the defendant had taken every reasonable precaution in order to carry out the Act of Parliament, and was not responsible for the condition of the car. The charge was eventually withdrawn upon the defendant agreeing to pay 5s. for costs.

THE VALUE OF A SPEEDOMETER.

Before the Hon. de Grey, at the South Western Police Court, William Rotheroe, driver to Mr. Fairclough, has been summoned for exceeding the speed limit at Roehampton Lane on December 8th. Mr. Taylor-Parkes (of Messrs. Amery-Parkes, Macklin), appeared on behalf of the defence. The evidence of the constables engaged upon the police trap was to the effect that the defendant covered a measured distance of 220 yards at the rate of twenty-six miles an hour. It was admitted in cross-examination that the defendant, who stopped, pointed out his speedometer, the tell-tale hand of which showed that the maximum speed only reached fourteen miles an hour. The defendant was called and stated that he was only travelling at the rate of fourteen miles an hour according to the speedometer. Mr. Fairclough, who was sitting next to the driver, corroborated. Another occupant of the car stated that he saw the signal which was given by the constable at the beginning of the trap, this being given when the car was some little way over the commencement of the measured distance. The magistrate held that in this case he must accept the evidence of the speedometer, and he dismissed the summons accordingly.

ALLEGED DANGEROUS DRIVING.

At the Lambeth Police Court, Sam Mayo, the comedian, who resides at Brixton Road, was summoned before Mr. Hopkins, at the instance of the police, for driving a motor-car at Brixton on the night of November 30th in a manner which was dangerous to the public. P.C. Soames stated that on the night of November 30th he saw the defendant driving a motor-car in Brighton Terrace. The defendant turned the car directly under the head of a horse attached to a brougham and stopped. The defendant then backed it into Brighton Terrace, a distance of about 25 yards. A number of people who were leaving the music-hall had to run on the footway to escape being knocked down. In giving evidence the defendant said he thought the police might have prejudice against him in consequence of a policeman's song he had been singing. Three witnesses who were with him on the occasion in question agreed that there was nothing in his driving to justify the summons. He was ordered to pay a fine of 40s. and 2s. costs.

LOCAL BYE-LAW OR MOTOR CAR ACT.

At York Police Court, Robert Gale, of Brandesby Hall, Easingwold, was summoned under the York Local Act for driving a motor-car to the public danger in Gillygate, York, on December 5th. Supt. Woolnough asked the Bench to allow the alteration of the summons so that the case might be taken under the Motor Car Act. Mr. Crombie, for defendant, objected to this course, and the case was proceeded with. P.C. Clifford gave evidence of the alleged excessive speed. In reply to Mr. Crombie, the constable said he could not identify anyone in court

as the driver of the car. Mr. Crombie said his client was certainly in court, and if the witness could not recognise him there was no evidence against him. Replying to the Lord Mayor, Mr. Crombie declined to call his client, because, he said, if he did so the witnesses would say he recognised him. The Lord Mayor said the time of the Court could not be wasted in waiting for the defendant to show himself, and he adjourned the case for a week.

A DISMISSAL.

Seeing a motor-wagon in High Street, Tibshelf, on December 4th, P.C. Price guessed the speed at which it was going at ten miles an hour. Then Ernest Wassell, a Sutton-in-Ashfield motor driver, was charged at Clay Cross Court with driving a locomotive at a greater speed than four miles an hour in High Street, Tibshelf, on December 4th. The policeman said he saw the defendant driving a locomotive belonging to a Sutton-in-Ashfield flour firm in the direction of Morton. He estimated the rate at which it was going at about ten miles an hour. Large volumes of smoke and fire were issuing from the funnel, and some of the sparks fell upon some horses. Defendant said that the machine he was in charge of was one of four tons. On the date in question he had five tons on it. He made seven calls in the thoroughfare where the constable alleged the offence took place. He pulled up when he got to the Brampton Brewery Company's dray, and his companion led one of the horses past. The engine was registered to run at five miles an hour. He judged that he was going at the rate of about three or four miles an hour. He had not been warned about the speed by anyone, and was "dumbstruck" when the officer charged him two days after with the offence. It was not a traction engine but a steam motor. Supt. McLarty said he thought he would withdraw the case. He was under the impression that the vehicle was a heavy locomotive.

MR. WEIGEL'S APPEAL.

Many gentlemen well known in motoring circles gathered on Tuesday at East Sussex Quarter Sessions at Lewes, over which Sir William Grantham presided. Mr. D. M. Weigel appealed from the Haywards Heath justices, who had sentenced him to one month's imprisonment and suspended his licence for two years from the date of the expiration of the current licence. The charges were two—dangerous driving and refusing to stop for a constable in uniform in August last. The appeal was before the October Sessions and adjourned, after a suggestion on behalf of the police to reduce the punishment to a fine of £50 and suspension of the licence for one year.

Sir William Grantham said, as the result of a consultation of the Bench, that if wealthy people would drive motor-cars recklessly imprisonment was the only punishment for them. But he and his brother magistrates recognised that, owing to what happened at the October Sessions, Sir Charles Mathews and his client had been placed in the position practically of pleading guilty; and it would now be impossible to try the appeal equitably. Under those circumstances, the court would modify the sentence to the maximum fine of £50 instead of imprisonment, his licence would be suspended for twelve months from the time it expired, and on the second case the fine of £10 and costs would remain, and Mr. Weigel would have to pay the extra costs of the appeal.

A MOTOR-CAR ON A TAR-SPRAYED ROAD.

An interesting case arising out of a motor-car skidding on the dust-preventing tar spray has been heard at the Sheffield County Court, before Judge Benson. Edward Adams, of Dinnington, sued the Corporation of Sheffield for £9 6s. 11d. damages caused through the negligence of the defendants or their servants while repairing Handsworth Hill. The damages to his car amounted to £6 3s. 11d., and the remaining £3 3s. was for a new suit of clothes.

Plaintiff's case was that on July 15th he was driving his motor-car towards Sheffield, and when on the brow of Handsworth Hill he noticed that for some distance the whole breadth of the road, with the exception of a strip, was treated with a tar or creosote preparation. The track left clear was just broad enough for one vehicle. It was, however, blocked by a motor-lorry that had broken down through skidding, it was said, on the tar spray. Plaintiff brought his car to a standstill because he did not like the look of the road that had been treated. At that time a man who appeared to be a Corporation employee waved his hand for him to go across the tar spray. He let the car run at its lowest speed, but as soon as he got on it the wheels skidded violently. The car skidded for 100 yards, and then ran into the wall. Plaintiff was flung on to the tar, his car was damaged, and his clothes ruined by the tar. It was contended that the Corporation had done nothing to denote the peril of the road. The defence was that everything that was reasonable was done to warn the people going along the road. In addition to a red flag, barrier, and trestles, two men were stationed to keep traffic off the tar. There was quite sufficient room for two vehicles to pass on the part of the roadway that had not been treated. Had plaintiff used reasonable care he would not have skidded even on the tar. It was denied that the car was ever stopped, and it was stated that he was beckoned to keep off the tar.

His Honour thought that the plaintiff was decidedly of the impression that he was invited on the tar by the defendant's servants. He gave judgment, for the plaintiff, the amount agreed upon being: £7 16s. 11d.

AUTOMOBILE ACCIDENTS.

AN inquiry was conducted by Mr. Troutbeck, at Westminster, with reference to the death of Mary Sullivan, who was knocked down and killed by a motor-omnibus in Whitehall. Adelaide Wiegold said that she was walking with the deceased woman along Whitehall, and they crossed in the direction of the Horse Guards. They had nearly reached the kerb opposite the Cambridge statue when Sullivan exclaimed "Ad—," and before she could complete witness's Christian name she had been struck by a motor-omnibus. Witness turned, and saw her friend go down. Charles Wood, the conductor of the 'bus, said he was inside at the time, and noticed that the vehicle had pulled up very sharply. He found his driver in a fainting condition, and the deceased woman lay under the staircase. Alfred Pratt, the driver, said he saw the two young ladies crossing the road, and sounded his hooter, but it made only a faint sound. When near the kerb, Miss Sullivan took two steps backwards, and was caught by the mud-guard. Had she gone straight on she would have been all right.

The coroner observed that nobody could have any doubt about the increased danger of the London streets, especially in the central parts. This was owing to the improvement in means of transit demanded by the public. These motor-omnibuses, which were duly authorized after careful consideration, were a public convenience, but the pedestrian had to be considered. The increased street dangers could only be practically met by the very greatest care on the part of the drivers and of the public themselves. The jury returned a verdict of "Accidental death," and exonerated the driver from all blame.

A MOTORING accident happened on Thursday week, on the London and Brighton road, at Bolney. A car containing five persons was proceeding from London to Brighton. It passed the Queen's Head Hotel, and swung down the hill at a good pace. Just before the cross roads are reached there are sharp curves to the main road, and in rounding one of these the chauffeur apparently caught sight of a car coming towards him and steered sharply to the left. The car was suddenly turned completely over. The up car passed the overturned one safely and the driver sped on to warn any cars that might be rounding the bend so as to avoid a further complication of the smash. Several cars came along quickly after the accident, and assistance was obtained. The passengers of the overturned car were extricated from their position, much shaken and suffering from shock. The motor-car was subsequently removed to the Brighton and South Coast Motor Garage for repair.

THE inquest on Mrs. Maria Munday, who died from injuries inflicted by a motor-car in Denbigh Street, Pimlico, concluded on Tuesday in the Westminster Coroner's Court with a verdict of "Manslaughter" against the driver, Crawford Davis. Mrs. Munday's daughter said she and her mother were walking across Denbigh Street to their home when a motor-car came along. They thought they had time to cross, but when they reached the middle of the road the car was going at such a pace that the daughter thought it better to stop. Her mother hurried on, and as she reached the kerb the side of the car caught her and knocked her down. Mr. Charles Mersing said two motor-cars passed him at tremendous speed in Hindon Street; on the box seat of each of the cars were a driver and a girl. At Warwick Street one of the cars rushed round a parcel post van, and a moment later he heard a shout in Denbigh Street. Running there he saw a woman lying under one of the motor-cars apparently dying. The Coroner, in summing up, said, if the woman was rash or careless that was no excuse for the driver not being cautious. After the verdict of manslaughter against Davis he was committed for trial on the coroner's warrant.

LIGHTS ON VEHICLES.

SIR E. R. HENRY, the Chief Commissioner of the Metropolitan Police, has circulated a notice amongst railway companies and City firms drawing their attention to the new provisions of the Lights on Vehicles Act, 1907, which came into force on Wednesday. The new law enacts:—

"That every person who shall cause or permit any vehicle to be in any street, highway, or road, to which the public have access, during the period between one hour after sunset and one hour before sunrise, shall provide such vehicle with lamp or lamps in proper order, and so constructed and capable of being so attached as when lighted to the front to display a white light, visible for a reasonable distance. If only one lamp is provided it shall be placed on the off or right side of the vehicle and if the lamp or lamps are so constructed as to permit a light to be seen from the rear, that light shall be red. He shall also, if the vehicle is used for the purpose of carrying timber, or any load projecting more than 6 ft. to the rear, provide the same with a lamp or lamps in proper working order, and so constructed and capable of being so attached as, when lighted, to display to the rear a red light visible for a reasonable distance."

Offenders are liable on summary conviction for each and every offence to a penalty not exceeding 40s., and in case of a second or subsequent conviction to a penalty not exceeding £5. The provision applies to any machine or implement of any kind drawn by animal traction, and to every sort of vehicle except bicycle, tricycle, velocipede, light locomotive or motor-car, heavy locomotive or wagon drawn thereby, required to carry lamps under other statutory provisions, or any vehicle drawn or propelled by hand.

APPEALS ALLOWED.

THE Lewes Quarter Sessions on Tuesday unanimously quashed the conviction by the Lewes County Bench of Mr. Cecil Chandless, of Sherington Manor, Selmeaton, Sussex, on a charge of recklessly driving his motor-car, for which he was fined £10. The court also ordered the magistrates to pay the costs of the appeal. In trying to avoid two restive horses Mr. Chandless's car ran into a toll-house. Mr. Humphreys, K.C., appeared for the magistrates; Lord Robert Cecil, K.C., M.P., and Mr. Jenkins (instructed by Mr. Staples Firth) appeared for Mr. Chandless.

A POINT of considerable interest to motorists was decided on Tuesday at Shropshire Quarter Sessions on an appeal by Mr. Algeron Percy, of Guye Cliffe, Warwick, against a conviction by Oswestry County Bench against him of driving to the danger of the public. The appellant admitted passing cross-roads marked by signal at nineteen miles an hour without blowing his horn, but he contended that as a policeman who was on the scene did not warn him he was entitled to assume that there was no danger. He denied that the officer was in concealment or that there were children on the road. The Court allowed the appeal.

HINTS ON FITTING THE STEPNEY SPARE WHEEL.

As we find that difficulty is often experienced in understanding the simplicity of fitting the Stepney spare wheel, the following instructions, issued by the Stepney Spare Motor Wheel, Ltd., may prove useful:—

1. Jack up the car until the deflated tyre is well off the ground.
2. The Stepney wheel is then placed alongside the car wheel, with the fixed clips uppermost and the adjustable clips down.
3. Place the two fixed clips of the wheel inside the uppermost edges of the rim (as far as possible from the security bolts and valve), and

A 60-h.p. German Daimler Lorry built for the German Military Authorities.

The vehicle, which is fitted with a six-cylinder engine, is able to carry a load of two tons and to haul four to six tons on trailers.

place the adjustable clips in position, keeping the spare wheel well pressed against the car wheel, then screw up the fly-nuts tightly with the hands only.

4. After the spare wheel has been fixed on it is well to see that the security fly-nuts of the deflated tyre are well screwed up with the fingers only, to prevent the deflated or damaged tyre from creeping.

5. The four brass bands sent out with the smaller spare wheel are to be fastened permanently to the spokes of the car (one only to each car wheel), to prevent the clip that engages the spoke of the car damaging the latter. These bands should be enamelled the same colour as the car wheels, as they then make a good "landmark" for the best position for fixing.

6. When fixing the brass spoke bands, see that the band is put on the spoke which will give the most clearance; or, if possible, that none of the hooks of the spare wheel will be against any of the security bolts of the car wheel. If the security bolts of the punctured tyre cannot all be cleared, unscrew a few turns the fly-nut of the security bolt which happens to come in the way and push it back, then the hook of the Stepney wheel will fit in over the rim all right.

7. Brass spoke bands are not required with the larger size Stepney wheels, which are fitted with leather straps.

8. If the bead of the punctured tyre is found to be sticking to the bead of the car rim, use a tyre lever to push the punctured tyre inwards, then it will be found that the Stepney can be easily fitted.

FROM Messrs. A. Darracq and Co. comes an interesting booklet devoted to testimonials from users of Darracq cars. It extends to about fifty pages, and the fact that there are on the average three letters to the page is evidence of the popularity of these vehicles.

FORTHCOMING EVENTS.

JANUARY, 1908.

- 4th-11th.—Dublin Motor Show.
 6th (M.).—Dinner of the Irish A.C. at the Gresham Hotel, Upper Sackville Street, Dublin.
 7th (T.).—Speed Limit Inquiry by L.G.B. Inspector at Kendal.
 8th (W.).—Incorporated Institution of Automobile Engineers—Dr. H. S. Hele-Shaw on the Fuel Question.
 Special meeting of the Royal A.C.
 8th (W.).—First R.A.C. drivers' examination for 1908.
 9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.
 11th (S.).—Annual meeting of the Lincolnshire M.C.C.
 15th (W.).—Conference of Automobile Club representatives, convened by the Motor Union, at St. Ermin's Hotel, Westminster, S.W.
 17th (F.).—Annual Dinner of the Nottinghamshire A.C. at the Victoria Station Hotel, Nottingham.
 18th-Feb. 2nd.—Automobile Exhibition at Turin.
 24th (F.).—Annual Dinner of the Scottish A.C. at Edinburgh.
 24th (S.).—Feb. 1st.—Scottish Motor Exhibition in the Waverley Market, Edinburgh, to be opened by Lord Kingaburgh.
 26th (Sun.).—Criterium de Voitures et Coupe de l'Exposition Trial for motor-cycles organised by the Turin A.C. and the Motor Club of Italy.
 27th (M.).—Annual general meeting of the Motor Cycling Club at 8 p.m., at the Tudor Hotel, London, W.
 29th (W.).—First lesson of the course to be given by Mr. R. S. Currie to the Ladies' A.C.
 31st (F.).—Annual meeting of the Blackheath A.C.

FEBRUARY.

- 1st (Sat.).—Annual meeting of the Lincolnshire A.C.
 2nd (Sun.).—Reliability Trial of the Motor Union of Western India.
 7th-15th.—Manchester Motor Show at Pelle Vue.
 12th (W.).—Mr. F. W. Lancaster on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 15th (Sat.).—Auto-Cycle Union Annual Dinner.
 20th (Th.).—Meeting of the Essex M.C.
 Mr. H. R. de Salis on the Inland Waterways of England and Wales from the motor-boating point of view.
 24th (M.).—Motor Show at Bombay.

MARCH.

- 21st (S.).—28th (S.).—Cordingley's Thirteenth International Motor-Car Exhibition at the Royal Agricultural Hall, London.

APRIL.

- Auto-Cycle Union's Tourist Trophy Race and Quarterly Trial.
 18th.—First meeting of the Brooklands A.R.C. for 1908. The full programme for the season appears in our Club News.

MAY.

- 10th (Sun.).—Targa Florio.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

- Royal A.C. Reliability Trial for Touring Cars.
 15th-19th.—Scottish Reliability Trial.

LIGHTING-UP TIME—LONDON.

ROAD REPORTS.

TOTTENHAM.—The Tottenham District Council has given its approval to a proposal for the construction of a new roadway across the marshes to connect the lower part of the district with Walthamstow, subject to the Tottenham and Edmonton Gas Company providing all the necessary material for the work, and negotiating and settling with the Great Eastern Railway Company for the erection of a bridge over its main line, and to the road being continued into Walthamstow.

WIGTOWNSHIRE.—At a meeting of the Rhins District Committee of Wigtownshire County Council, held at Stranraer, a report by the Road Surveyor as to restriction posts and danger signals for the regulation of motor-car traffic has been considered, and after much discussion the surveyor's recommendation of the places for the erection of notice boards was adopted. Some of the speakers wanted restriction of speed especially on the narrow roads.

HAMPSHIRE.—Among the roads under repair are the main road between Bishop's Wareham and Upham, the Winchester and Southampton road between Otterbourne and Chandler's Ford, and the Winchester and Andover road between the first and fourth milestones.

POLICE TRAPS.

We would advise motorists passing through Kingston not to exceed the legal limits either in the ten mile or twenty mile section of the town.

In the parish of Allesley (near Coventry) a measured quarter of a mile is frequently operated by the police against motorists.

NOT satisfied with the imposition of a speed limit of ten miles an hour through the village of Handross, the residents now desire the permanent placing of a policeman on that particular mile of highway. Why cannot they apply to the A.A. for a scout?

EXTREME caution should be exercised by all who motor through the streets of Bournemouth.

THE local authorities at Winchester are urging the police to greater activity against motorists.

CLAIM AGAINST MOTORIST DISMISSED.

AT the Wandsworth County Court, before Judge Woodcock, Mr. Davies, of Clapham Rise, was sued for £30 12s. for damages for personal injuries alleged to have been done by his negligent driving of his motor-car. At the close of the case for the plaintiff, Mr. Staples Firth submitted for the defendant that, although it was common ground that an accident had happened, there was not sufficient evidence to support an action in law, as there was no evidence of negligence. After the defendant had been put into the witness-box his Honour dismissed the case with costs.

BUSINESS NEWS.

THE RIGHT HON. THE EARL OF DARTMOUTH, P.C., has ordered a 36-h.p. car of the Padley type from the Daimler Company.

MR. GEORGE DU CROS has now decided definitely to give his whole energies to the affairs of Messrs. Panhard and Levassor, making the works at Acton Vale his headquarters. Mr. Willie du Cros will look after the business of W. and G. du Cros, at 14, Regent Street, S.W.

ANOTHER accessory, in addition to those already mentioned, which contributed to the success of Mr. W. T. Clifford Earp's record on Brooklands track was the coil, which was of the E.I.C. type.

THE North of England depot for the Parsons non-skid is at 237, Deansgate, Manchester.

THE DEASY MOTOR CAR MANUFACTURING COMPANY, LTD., have received a telegram from a gentleman in India, who has a 24-h.p. Deasy car, stating that he has made a splendid record run under six days, between Bombay and Calcutta.

MR. H. WAYMOUTH PRANCE, 39, Westbourne Gardens, W., is, in addition to carrying out expert examinations of second-hand cars, supplying new cars and giving free tuition and assistance to the purchasers.

THE Pegasus detachable non-skid can be seen by City motorists at the London showroom of Messrs. Middlemore and Lamplugh, Ltd., 23, Wool Exchange, Basinghall Street, E.C.

THE marked manner in which the Stepney wheel is growing in popularity was shown on Monday morning last. When the Christmas post was opened at the company's offices at Llanelli it showed orders for no fewer than 350 spare wheels.

THE CIE DES MAGNETOS SIMMS-BOSCH, LTD., of 23, Store Street, London, W.C., has adopted the name of "The Bosch Magneto Company, Ltd." and will describe what has hitherto been known as the Simms-Bosch magneto as the Bosch.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 87-88, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, JANUARY 11, 1908.

[No. 462.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

WE have always regarded motor scouts as ancillary to the police in securing the safety of the road. They perform useful service in preventing the breach of the law, and by warning motorists who are apparently going beyond reasonable limits are performing a public service. This view, however, has heretofore been rejected by the police, who apparently are more anxious to catch people after the commission of an offence than to prevent the alleged misdemeanour. Therefore, we naturally welcome the decision of the Newmarket justices on Tuesday, when they

accepted the plea of Sir Charles Mathews that there is no illegality in an endeavour to prevent a breach of the law, provided, of course, that no physical interference or obstruction takes place. The decision thus going on the lines of the Croydon case of *Constable v. Little* should encourage the Automobile Association to continue their good work. In fact, the police evidence fully proved its value to motorists, for a sergeant was able to testify that the scout, whose assiduity seemed to annoy the officers, had scented traps despite the attempted concealment of the police, and had warned many drivers of their proximity to the ten mile limit zone. The explanation of their system by the police and the demonstration of how it can be legally met by the A.A. organisation is a welcome New Year's greeting to one of the most virile of the motoring societies.

Courtesy on the Road.

THE Signs and Notices Committee of the Motor Union have drawn up some Rules and Courtesies of the road, which will shortly be generally distributed among local authorities as well as those who own and drive motor vehicles. In

our last issue we gave these suggestions in full in the final form in which they have been adopted by the General Committee. It now remains for our readers not only to observe these rules, but also to make them known to all who use the roads, whether for motor traffic or horse-drawn vehicles, for the mutual benefit of everybody.

London's Traffic Muddle.

APART from the question of method of industrial remuneration which is involved in the unfortunate dispute that has kept a couple of hundred motor-buses in their garages while their owners have seen the chance of profit shrinking quickly, the present motor-bus strike in London suggests the necessity for the organisation of traffic in such a way that the public are not likely to be inconvenienced. The patrons of the motor-bus in London have had their patience sorely tried of late. They have a hazy idea that the mechanical vehicle is the cause of the shortening of penny stages; they know it sometimes plays pranks when they are on the way to catch trains that wait not on the street traffic's delay; and now they find that, having driven many horse-drawn buses off the road, the motor-bus is not running. In face of such a triple

set of adverse circumstances the enthusiasm of the motor-bus advocate may well be frozen. In London we have a spectacle of tubes, trams, trains, above and below ground, cabs, buses and other means of locomotion competing with each other in the most unbusinesslike pantomimic mix-up. Surely some advisory statutory body is needed to suggest or compel reason to prevail, so that the public convenience and capital invested shall both be safeguarded. The present position is simply ruinous to the proprietors and too uncertain to be regarded with pleasure by those who travel daily through the great Heart of the Empire.

The Present Strike.

STRIKES which are likely to produce inconvenience to the public cannot be popular, and when, in addition, they are directed against companies with declining profits, the chances of success are further reduced. Hence the surprise

with which many have watched the enforced idleness of the "Union Jack" motor-buses in London during the past few days. The question of the dispute is easily resolvable into words, the gist of the matter being the adoption by the London Road Car Company of the system of payment by the journey, which is adopted by the Vanguard and the London General Omnibus companies, or the continuance of the daily wage plan, under which the men had a guaranteed wage on taking their vehicle out of the garage. Altogether about 1,300 men are involved in the dispute.

Motoring in Ireland.

IRELAND, which this week is enjoying a really excellent motor exhibition in Dublin, has always favoured the motor movement. Fortunately, the Lord Lieutenants appointed by the last two Governments have been equally well dis-

posed towards the automobile, and Sir Horace Plunkett, whose public services are recognised in Ireland, has not allowed his official position to prevent his active presidency of the Irish Automobile Club. The Earl of Dudley did much for motorists in the Gordon Bennett year, and the Earl of Aberdeen, by declaring open both the 1907 and the 1908 motor exhibitions, has indicated an equally keen solicitude for the advance of motorism in the Emerald Isle. Hitherto its main successes have been concerned with the pleasure side of the automobile; but the recent advent of motor lorries into Belfast has convinced many Irishmen of the commercial possibilities as well as the pleasurable side of the motor vehicle.

An Appeal from Horsham.

LAST week was a memorable one for Sussex justices, for both at the East and the West Quarter Sessions were decisions adverse to motorists quashed on appeal. This is a satisfactory start for the New Year, and if those owners who are fined without proper cause would be more ready to appeal than has hitherto been the case, much of the persecution that has existed in Sussex would quickly cease. The appeal which was allowed at the West Sussex Sessions, on Thursday of last week, is typical of many similar cases that could be equally well won by motorists so public-spirited as Mr. T. E. Comins, of Clapham.

Park. He was motoring with his wife and two friends, in October, between Ruspur and Horsham, when a dog rushed under the car and was killed. Summoned at Horsham for "dangerous" driving, he was fined £10 and costs. Against such severity he appealed, and Mr. Leonard Costello, on his behalf, clearly established the facts that the car was being driven at only a moderate pace, that the hooter had been sounded, and that there was not the slightest danger to the public. So clear was the case that the chairman of the Bench said the magistrates would decide it without speeches from counsel, and they thereupon allowed the appeal, emphasising the vindication of Mr. Comins by allowing costs against the police.

Benevolence in the Motor Trade.

SEVERAL times has the suggestion been put forward that the benevolent instincts and resources of those engaged in the motor business should be organised in a definite form with a view to assisting those who may, from time to time, be in need of help. Almost every great industry, recognising the mutability of things, has its philanthropic society or organisation to help those who may fall away from prosperity. So that, as the motor business expanded, the concrete expression of a feeling of goodwill towards those in the rear was only in accordance with the practice of other industries. Fortunately, in the

Touring in France.—A snapshot of a Hotchkiss Car taken between Pontaurum and Pontgibaud.

cycle business, from which many of those engaged in motorism have evolved, there was an organisation ready to hand which many believed could be readily extended to embrace those in the motor branch of locomotion. Negotiations with this object have been in progress for some time past, and at the meeting to be held on the 29th inst. these will be brought to a conclusion. Seeing that the members of the executive committee of the Cycle Trade Benevolent Fund, of which Mr. A. J. Wilson is the hon. secretary and treasurer, are unanimously in favour of a change in the name and constitution of the association, to include the motor trade within its scope, there is little doubt that the scheme which is outlined in our "Association News" will be adopted. Its objects are worthy, and should be worthily supported by the whole of the automobile industry.

The Philosophy of Advertisement.

APPARENTLY the splendid way in which the county surveyors are encouraging the movement for the adequate trimming of hedges at dangerous corners, and otherwise reducing the risks to those who use the highways, has moved a member of the Athenæum Club to write to the *Times*. He is alarmed for the rural beauty of the country, and deprecates the reduction of the hedges and also the "advertising vulgarity"

which leads motor firms to "defile the countryside" with their announcements. In the old days of horse traction such publicity was unnecessary. Why, then, should motor firms do what carriage builders, horse dealers and blacksmiths did not? We would console this learned correspondent with the assurance that this is only a transient phase in the development of a great industry. Steadily the motor traders will learn that the expense of such advertisement is greater than any other—proportionately to the results—and that they are paying to proclaim themselves to hundreds of people of whom only half dozens are ever likely to be interested from a business point of view. The wise people are those who realise that the prospective motorist goes to the motor Press for information, and looks to their pages for announcements that are likely to help him in his quest. Therefore the quiet haven of the Athenæum need not be disturbed for long. The force of circumstances will cause the matter to right itself in good time.

In the New Forest.

SOME months since the Court of Verderers of the New Forest called the attention of motorists to the necessity for exercising care when enjoying drives through that delightful part of the country. Now, again, the warning is desirable, a large number of owners of cars having had their interest whetted in that part of Hampshire by the recent visit of the German Emperor. They have lately visited the Forest in increasing numbers, and several cases have occurred of animals belonging to the commoners being run into by motor-cars, particularly at night. It should be remembered that the conditions of the New Forest are peculiar, and that the roads are unfenced, because they form part of the area over which common rights are exercised by a good many of the dwellers in those regions. They have the right to allow their animals to wander at will on the roads as well as in other parts of the Forest, with the result that they are often found thereon. Local motorists drive with care and caution, as Lord Montagu and others who are interested, both in the New Forest and the motor movement, can testify, and it would be well if strangers to the locality were informed, at all points at which they are likely to stop, of the custom of the commoners, so that sympathies with rapid locomotion are not alienated.

Fees Payable.

AT this season of the year the thoughts of motorists rightly turn to thoughts of fees—or the Inland Revenue people will remind them of their obligations to that department of the State. Some uncertainty prevails among the newer order of motorists as to the recurrence of their licensing and registration fees. These may be set out for easy remembrance as follows:—The driving licence has to be renewed annually from the date of being taken out; the original registration of the car lasts as long as the car, unless cancelled owing to change of ownership; and the Inland Revenue fees are due annually at the beginning of the year. Hence the activity of many of the officers during the past few days, of which due notice should be taken by all concerned.

A Tribute to Mr. C. D. Rose, M.P.

THE pioneers of the Royal Automobile Club, to the number of fifty-six, have met at the club-house for the tenth annual dinner of the Founder members. Mr. Roger W. Wallace, K.C., presided, and the health of the Founder members was proposed by Mr. C. D. Rose, M.P., who, with Mr. J. W. Orde, the club secretary, drank to the toast. Mr. Rose, in proposing the same, referred to the good work that had been done by those who ten years ago endured the scoffs of the public and joined together in founding the organisation, which would shortly have one of the finest club houses in the world. Mr. Rose was also at the business meeting of the Motor Union when the dissolution agreement with the R.A.C. was signed. His year of

office in connection with the M.U. has expired, and his name has, by an unanimous vote of the General Committee, been added to the list of vice-presidents of that organisation. Only those who have been behind the scenes with regard to motor policy during 1907 can estimate the value of the service rendered by the member for Newmarket to the automobile world. On many occasions his tact has secured good feeling and made less irksome the difficulties of those concerned in the development of the various societies connected with motoring.

Graduates in Motor Engineering.

CONSIDERABLE activity of a well-directed order has marked the first year's existence of the Incorporated Institution of Automobile Engineers, and further development is now proceeding with regard to the graduates' section, which should have an important bearing on the future of the technical side of the movement. A general meeting of pupils, apprentices and junior draughtsmen employed in the motor industry will be held on the 4th prox., under the auspices of the graduates' section of the Institution, and young engineers who intend to

who had been one of the advisers to the Indian Government with regard to the drafting of a Motor Car Act for the Presidency of Bombay, said that although that was a large city, where traffic was much more congested than in Belfast, he came to the conclusion that speed restrictions such as were now proposed did not constitute the proper way of dealing with the matter, but that each case should be considered according to its merits. We wish well to the new organisation, which starts with such a splendid prospect of doing useful work for the motorists of the north of Ireland. Seeing that there are 700 motorists in Belfast, a strong organisation should easily be founded.

Payment by Mileage.

THE toll bar proposal of Lord Breadalbane, to which we referred last week, has not found much favour north of the Tweed, while it has called forth many opposing controversialists. The scheme of having tolls at the entry to a county is generally held to be impracticable. In all counties there are numerous entries, and this would necessitate a toll at each entry—a great expense. Besides, there might be a considerable hard-

An Interesting Picture from Java.

The Kaiser Soerakarta Pakoe Boewono X. (I.) and his Daimler car, which was supplied through Messrs. Pröttel and Co., of Soerabaya. Other members of the group are the Prime Minister, Raden Adzuti Soerodi Niuwrat (II.), Tonkheer van Holtke (III.), and Werner, the engineer (IV.). The incident of the soldier holding the footstool for the Kaiser to enter his car is extremely interesting.

specialise in motor engineering will also be welcomed to the gathering, which will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W. Following a lecture by Dr. H. S. Hele-Shaw, a graduates' society will be formed and a programme of work considered. All interested in the meeting should apply for tickets of admission to the Secretary of the Institution, at 1, Albemarle Street, W.

Agitation in Belfast.

AN important meeting of motor-car owners and gentlemen interested in automobilism was held at Belfast on Friday of last week, called by way of protest against the proposed speed limit of ten miles for motor-cars within the city boundary, and in order to form a club for mutual defence. The protest was made and the club formed, some useful speeches being made, and a guarantee fund to meet expenses likely to be incurred in opposing the threatened restriction was started with £260. In the course of the discussion Mr. John Tate,

ship in connection with it. Many houses are so situated that motorists cannot travel many miles without being in several counties. One correspondent writes:—"I am out of my own county in four miles, and my market town, six miles away, is in a different county." Another suggests, "What to me seems to be the most reasonable way would be that every motor should carry a motometer, which would register the mileage run, and that each owner should pay on his mileage. Of course this would mean a department for the whole country, which would issue motometers, collect the amounts payable, and allocate the moneys to the different counties in proportion to their mileage of roads suitable for motor traffic." The idea of paying on a mileage scale to use a car after it has been purchased is decidedly entertaining; but why stop at motor vehicles, why not suggest that every pedestrian should also be provided, or fitted with a trip recorder, so that the proportion of each person's wear and tear of the pavement could be ascertained? The notion may sound more foolish than the former idea; but it has as much likelihood of adoption.

MOTORING TOURS IN THE PARIS DISTRICT.

PROBABLY few foreigners, and perhaps not many Parisians, know the delights and charms of all the cities and towns, and the neighbouring countryside, within say a radius of fifty miles from the Place de la Concorde. Within this charmed circle there is a wealth of shrines at which one may worship, and uncounted kilometres of crossing and recrossing historic highways, which most automobilists would like to make acquaintance with if the way were only pointed out. There is, to be sure, a stretch of roadway now and then, even outside what may be called suburban Paris, which is distinctly bad, because of the *pavé*. There is such a stretch through St. Germain-en-Laye, another at St. Denis—*en route* to Chantilly and Compiègne, and at Villeneuve-St. Georges—going out to Fontainebleau; and very bad samples of roadway they are. A great circle drawn around “la ville lumière,” with a circumference of five hundred kilometres, more or less—and often not out of sight of the Tour Eiffel or the Sacré Cœur—will give two or three days—or better a week—of as enjoyable sightseeing touring as can be had in a straightaway run across the better part of France to Aix-les-Bains or Vichy. The following outline is only an approximate possible itinerary, and if it is not desired to cover the entire ground portions of it can be combined with a tour in Normandy, or taken *en route* from Paris to Switzerland, to the Rhine, or into Touraine. It will be time well spent for those who have hitherto thought they already knew France well, and considerably newer ground will be turned over than is to be found in many regions more remote.

Since the touring motorist usually enters France *via* Havre or Dieppe and the valley of the Seine, he ultimately reaches St. Germain just before entering Paris—this point has been taken as the commencement of the itinerary. If one actually is in Paris he can go out by any of the *portes*, or gates, and take up with the itinerary where he will at any point along its periphery. There are very good reasons for entering France with one's car *via* Havre; there are better facilities for unshipping it than elsewhere; there is a garage proprietor there who especially concerns himself with getting you “started right,” and will even

The Arc de Triomphe, Paris.

arrange the preliminaries of your “Certificat de Capacité” and “Recepisé de Déclaration”—if you advise him beforehand—and may perhaps be able to save you twenty-four or forty-eight hours hanging around Havre or Rouen trying to accomplish the thing yourself, with only the vaguest notions as to how to go about it. Once one has finally got free of these “formalities” and his port of entry, one reaches St. Germain *via* the great Route Nationale, familiarly known as the “Route de Quarante Sous.”

The *pavé* of cobble stones through the main streets of St. Germain is about as bad as you will find. There is good garage

accommodation at the Hotel du Pavillon Louis XIV., and the eating and sleeping arrangements are equally good and expensive, the hotel being appointed by the Automobile Club de France and three-starred in the “Guide Michelin.” Still this is the place to stop whilst “doing” St. Germain, its Chateau Neuf of Henri Quatre, the remarkable birdseye view from the Terrasse—built by Le Notre in 1672, and the great alleys of the Fôret. It is all hallowed and historic ground, and the guide books will enumerate the “sights” more fully.

From St. Germain to Versailles is only twelve kilometres, descending to the level of the Seine and then climbing up again.

The Rue des Reservoirs, Versailles.

through Marley. The *pavé* now disappears, in part, but what there is left is bad enough; it can be entirely avoided by leaving St. Germain by the route through the Fôret de Marley, and entering Versailles by the back door, as it were, and the distance is not perceptibly greater. Versailles and its chateau, and its gardens, its fountains, its Trianons, and all its other charms, is the beau idéal of the tourist's chateau. For the sight-seer Versailles is worth at least half a day, it can hardly be done in less. That makes, with St. Germain, practically a day already, but one can readily enough get on to Rambouillet, another thirty kilometres, for the night. The road to Rambouillet from Versailles *via* Trappe through the Fôret de Rambouillet, where were held the royal hunts of other and more picturesque days. Here, too, are still held “Les chasses Nationales,” when visiting royalties are invited to go out and kill something by the present figurehead of republican France. The road is a delightful one through its whole length, and in the forest itself it runs through great alleys of pines in a most romantic and truly delightful fashion. As one comes up with Rambouillet, the town, there is more cobble stone *pavé*, and particularly vile it is. Either the Croix Blanche or the Lion d'Or are good enough hotels, at any time except between Friday and Monday, when they are apt to be filled with week-end trippers out from Paris. The attractions of Rambouillet are its chateau, which since the very earliest times has been a royal hunting lodge. Francois Premier died here, and in Napoleonic days it was a retreat for many of the followers of the “little corporal,” and he himself—at the end of his first day's journey when going to his exile—slept within its walls. Here, too, at the end of monarchical times under the restoration Charles X. signed his abdication.

(To be concluded.)

A MOTOR-CAR collision at Grimsby was one of the causes that led to the appearance of a marine engineer at the local bankruptcy court. He told the Official Receiver that he got a motor-car on the hire purchase system, and last May he had a collision with a cyclist. A County Court action was the outcome, and he lost the case, being mulcted in expenses totalling nearly £30. He had to file his petition, and the proprietors had seized the car.

SOME WINTER MOTORING TIPS.

BY A. E. S. CRAIG.

LIKE the answer to the question, "Is life worth living?" "It depends upon the liver," the amount of pleasure or pain that can be extracted from pursuing one's motoring career throughout the months of winter's gloom depends largely on the idiosyncrasy of the people who make a habit of doing so. Imagination is responsible for keeping a lot of motor-cars locked up during the orthodox period that is termed "the winter months," and the same worthy souls who will embark in the teeth of a biting east wind, with accompanying showers of hail, in April, could not be persuaded to climb into a car within a month of either side of Christmas Day, however harmless the temperature and general outlook. But, although imagination is responsible for keeping a lot of people from enjoying the pleasures of motoring, there is a very real side to the matter, the side that in all seriousness affects the possibility of a winter

keep without movement for a long time at a stretch. No clothing is really warm in itself, and it is only its capacity to retain an insulating partition of air (kept warm by the body) between us and the surrounding atmosphere that determines its relative utility as regards keeping us from feeling the cold. Now it is, perhaps, superfluous to point out that a motor-car travelling at legal limit, or over, is equivalent to a pretty strong wind; but one is apt to forget that if running in the face of a breeze as well we are encountering half a gale. Therefore it stands to reason that our clothing must be so made as to prevent the fierce and continual draught to which we are subjected from finding its way down our necks, up our sleeves, as well as whatever covering, according to our sex, guards our nether extremities. For just as a radiator is more or less efficient, according to the area of water it is able to expose to the current of air drawn through its structure, so, *per contra*, is motor clothing ineffectual which affords ingress to the wind and permits our film of body-warmed air to be extracted from us. Let us, therefore, keep the necessity before us of arraying ourselves in attire which is cal-

Motoring in the Snow on the Zirlerberg, near Innsbruck, Tyrol.

jaunt on a car being an agreeable affair to undertake, and it is upon this, the practical side, that I propose to make a few remarks.

In the early days of motoring, howls of delight greeted the appearance of a duly swathed and swaddled chauffeur, who had probably bought his experience, not to mention his clothes, on the Continent, and even to this day the funny (?) papers, and the music halls, revel in the new "property" they have added to their repertoire. Vulgar astonishment finds relief in hilarity, but foolish indeed are they who may be deterred from assuring to themselves ample protection from the elements, if by so doing they run the risk of being laughed at by the ill-bred; the same impolite individuals would find equal amusement at a funeral not conducted on conventional lines. For winter motoring, therefore, let us first assure our bodily comfort, by a sensible and fully adequate selection of clothing. In choosing this equipment the novice is apt to greatly underestimate the penetrating power of the wind, and the stagnation of the circulation by having to

culated to thwart the persistent attentions of the wind in selecting our winter outfit.

What a dread bugbear is conjured up by the possibility of the water freezing in the radiator and water jackets, and so causing untold expense and tribulation! For this reason alone some are foolish enough to empty their circulating apparatus at the first touch of frost, and forego the use of their cars until the flowers begin to bloom. All sorts of anti-freezing concoctions are recommended, and, in case there are any that like to try some, I append a few prescriptions as follows:—Add to the water 10 per cent. of methylated spirit (wood alcohol) to avoid freezing down to 15 deg. Fahr., or 25 per cent. down to zero by the same thermometer. Similarly glycerine added in the proportion of 10 per cent. will protect down to 20 deg. Fahr., and 25 per cent. down to 5 deg. Fahr. Alternatively a mixture of the above two fluids may be used. Hydrated calcium chloride, if added to the circulating water to the extent of 10 per cent., will ensure against Jack Frost down to 15 deg. Fahr., or a

25 per cent. mixture down to zero. I should imagine the last named remedy would be very sure to cause trouble with the pump, and also by forming deposits in the radiator and cylinder jackets, especially if the water at any time reaches boiling point. Personally, I would not be troubled with any mixtures, at any rate in this country. For I believe that in the end ordinary precautions are less worry, and certainly less expensive. The letter of Mr. S. F. Edge which was published in the *M.C.J.* of the 28th ult. pointed out how effectual is the simple expedient of covering the radiator and bonnet with a rug when the car is left exposed, a thermometer showing that only 8 deg. of heat were lost during a period of three hours, whereas by failing to do so a drop of 53 deg. was indicated during a similar period. Now three hours is quite a long time to leave a car exposed outdoors, and yet it is obvious that the motor in question could have been left for a much longer period, if it had been so required.

Then, as regards the garage itself, the same procedure may be adopted, although I am strongly in favour of always keeping the car in a genial atmosphere by means, when necessary, of artificial heat. A very small gas or oil stove will suffice to maintain the requisite temperature, or better, because safer, of course, a hot-water heating apparatus. Once installed the after expense is quite insignificant; in fact, it is in many ways a real economy. First and foremost the water need not be emptied out of the car, nor need one even trouble to tuck a rug round the front of the vehicle. Then the oil in the lubricators will not become too viscous to start feeding properly when the car is first started out on its journey. And last, but not least, the time spent in cleaning and adjustments is less fraught with suffering, and the work in consequence less likely to be scamped; for who can fiddle about in an ice-house with numbed fingers, handling metal at freezing point, and yet do the work as conscientiously and as well as one can if working in bodily comfort?

Of course, when we are motoring away from home we often have to put up with accommodation for our steed that renders it imperative, if we have not an anti-freezing mixture, to empty out the water. And, in view of such eventualities, it is most important that we should first assure ourselves that the water can be emptied out from all parts. For instance, we must make sure that the water can be drained from the cylinder jackets, and the pump, as well as the radiator; and in some cases this is not possible. Therefore, to make sure, it is as well to have a tap fitted to the bottom of each jacket and also under the pump itself. And if the oil tank is in an exposed position on the dash, it is almost worth the trouble to have a large bore tap fitted, so that the oil can be quickly drained off, and replaced in the morning in an uncongealed condition. Failing this, it will be as well to have a felt cover made to fit it snugly, and slip this on when the journey is over. In fact, such a cover could with advantage be kept on during very cold weather, in cases where the oil is not warmed by exhaust gas under pressure.

Talking of exhaust gas brings me to the subject of further utilising this waste heat. This has been proposed over and over again, and although in some cases car owners have had some fittings made at their own expense, I am not aware of any manufacturers in this country making an exhaust car-warmer (which can be cut out at will) as a standard fitting. Such an installation, however, carried out in an efficient manner, is a real luxury, and the added comfort is, I consider, well worth the small additional expense entailed. The addition of side doors between the dash and the front seat undoubtedly keeps away a lot of cold from those sitting in that position; but I think that a waterproof apron, that can be fixed to the dash, and extending well up to the seat, with provision for strapping behind the occupants, is much wanted. It should be wide enough to extend to either side of the car, and have flaps reaching to the floorboards. This allows greater freedom to the legs than is possible when a rug is wrapped round these limbs, and, by being fixed fore and aft, prevents it slipping out of position continually.

Needless to say, the coach-builder plays an important part in the comfort of passengers, and their protection from side draughts, even in open bodies. Soft, springy seats, into which

the body fits snugly, make a ride in a car so fitted a revelation to those who hitherto have only journeyed in nasty skimpy little bodies, or with hard uncompromising cushions. Wind screens are becoming very popular, in spite of the appreciable difference made to the going, when running against the wind, and in spite of the undoubted element of danger introduced; this latter, partly on account of the risk of being cut by broken glass in the case of a smash, and partly owing to the really great difficulty of seeing properly when rain begins to beat on the screen. I think that all wind screens should be capable of easy adjustment, both as regards height and angle at which they are set, and also of being lowered altogether without a lot of trouble. Some wind screens are fitted with glass reinforced by wire netting, so that in the event of breaking, the fragments cannot fly; but, apart from the chicken-run appearance it gives to the car, I find it exceedingly trying to the eyes. Another idea is to cement a sheet of celluloid between two plates of glass, but I have not seen many screens so fitted; perhaps it is found that the celluloid turns yellow.

Now as to skidding; this is indeed the "old man of the sea" of motoring, not only in winter, but at any time in this erratic climate, the solution of which is yet to be achieved. But there are, after all, heaps of dry days in winter, and, equipped with non-skids and a little discretion, which is better than valour, there is no reason why one need fear trouble. I am sure that

Motoring in Chicago.

From a Caricature Sketch]

[Published by the Berliet Company.

all careful and experienced motorists will bear me out in averring that 90 per cent. of accidents through skidding are due to rash and therefore foolish driving. Brakes on the front wheels would certainly enable a car to hold itself from side-slip to a considerable extent, and it is somewhat surprising that they are scarcely ever fitted. So also would some contrivance on the Hedgeland principle be an improvement on the differential, as there is no doubt that the chance of side-slipping would be somewhat reduced thereby.

Finally, like many another thing that is either a success or a failure, according as to whether it is logically pursued or the reverse, winter motoring is merely a case of adequate preparation, backed up by a little common sense and determination to ensure a full measure of the former. Out, then, with our motors, and let us show the world that they are not fair weather toys, and that we can even face a few flakes of snow in them, and yet be merry.

CALCIUM carbide will shortly be manufactured in this country, at works adjoining the Yorkshire Electric Power Company's generating station, near Dewsbury.

MAJOR G. E. SMITH, R.E., recently drove the Right Hon. Mr. Winston Churchill to Fort Hall, British East Africa, and back, a distance of about sixty miles over almost impassable roads, on his Turner-Miesse steam car.

THE SETTING OF VALVES.

In a recent issue a correspondent of the *M.C.J.* drew attention to the lack of definite information as to the exact setting or timing recommended by the different makers for the inlet and exhaust valves of their petrol motors, and also to the considerable variation in the practice adopted by the various

Fig. 1.—Diagram of Valve Setting for Deasy Cars.

firms. As no doubt the particulars will be useful, not only to users of the particular cars mentioned but also to motor-car repairers generally, we have asked a number of well-known concerns to afford us some details of the method they adopt in this particular connection, their responses being given below. It will be seen that our correspondents' opinion as to the great variation in the valve timing of different engines is fully borne out, not one of the seven firms mentioned adopting the same setting. In fact, so varying is the practice that there would appear to be ample scope for the carrying out of a series of tests to determine the most advantageous position, and we commend the suggestion to the consideration of the Institute of Automobile Engineers.

The Deasy Cars.

Mr. E. W. Lewis, of the Deasy Motor-Car Manufacturing Company, Ltd., Coventry, writes:—In your issue of December 21st there is a very interesting question raised in reference to valve setting by various makers. It is obvious that all the various settings as described cannot be correct. I enclose a diagram showing the valve setting used on all Deasy engines. It is quite simple and the dimensions are in degrees, and it should hold good whatever stroke the engine has. It would certainly be interesting if some of the well-known makers would give their experience of the results obtained from different settings. Personally, and from the experience I have gained, the setting, as shown on the diagram, gives the best all-round result. There is no gain by opening the exhaust valve earlier, even for high speeds, provided the exhaust valve is sufficiently large to carry away the products of combustion. It is much more necessary to have a correct timing of the inlet valve than the exhaust valve, and it will be seen from the diagram (Fig. 1) that the inlet valve closes 5 deg. past the dead centre. It also opens 10 deg. past the dead centre, which gives a complete half-revolution, plus 5 deg. of opening period. It will also be noticed that the exhaust valve closes 5 deg. before the inlet valve opens, and opens 30 deg. before arriving at the dead centre.

The Panhard Cars.

Mr. W. A. Turpin, the works manager of Messrs. Panhard and Levassor, Acton Vale, W., sends the following details with

regard to the arrangement adopted in the various sizes of Panhard engines:—

Setting the inlet valves: 8-h.p. and 10-h.p.—Inlet valves are automatic. 15-h.p. and 18-h.p.—The valve opens when the piston is 2 mm. (1-16 in.) down from the top on the suction stroke, and closes when the piston is 10 to 14 mm. ($\frac{3}{8}$ in. to $\frac{1}{2}$ in.) up from the bottom of the compression stroke. 24-h.p.—The valve opens as above, and closes when the piston is 13 to 17 mm. ($\frac{1}{2}$ in. to $\frac{3}{8}$ in.) up from the bottom on the compression stroke.

Setting of exhaust valves: 8-h.p. and 10-h.p.—The valve opens when the piston is 10 to 14 mm. ($\frac{3}{8}$ in. to $\frac{1}{2}$ in.) from the end of the explosion stroke and closes when the piston is 2 mm. (1-16 in.) from the top of the suction stroke. 15-h.p. and 18-h.p.—The valve opens when the piston is 11 to 15 mm. ($\frac{3}{8}$ in. to 9-16 in.) from the end of the explosion stroke and closes as above. 24-h.p.—The valve opens when the piston is 14 to 18 mm. ($\frac{1}{2}$ in. to 11-16 in.) from the end of the explosion stroke and closes as above. Mr. Turpin adds that it is most important to replace the valves in the same cylinders from which they are removed.

The Brasier Cars.

Messrs. Mann and Overtons, Ltd., the sole concessionaires for the Brasier cars in this country, inform us that in these vehicles the exhaust valve opens 16 mm. from the bottom of the explosion stroke of the piston and closes at the top of the exhaust stroke. The inlet opens 1 mm. below the commencement of the suction stroke.

The Star Cars.

Fig. 2 shows diagrammatically the method of timing the valves adopted in the Star cars of the Star Engineering Company. It will be seen that the exhaust valves have an advance of 40 degrees on the crankshaft—that is, they are timed to commence opening 7-16 in. from the bottom of the explosion stroke of the piston. The closing takes place exactly on the dead centre of the completion of the exhaust stroke. The inlet valves are set so as to open and close exactly on the commencement and end of the suction stroke of the piston.

Fig. 2.—Diagram of Valve Setting for Star Cars.

The Aster Engines.

Mr. S. W. Begbie, of the Aster Engineering Company, Ltd., writes:—As regards the timing of Aster engines we adopt a different arrangement for fast-running engines and for slower running motors. For the former we set the valves as follows:—Inlet opens 4 mm. down the suction stroke of the piston, and closes 18 mm. up on the compression stroke. The reason for opening slightly late is that a slight vacuum is formed which induces the vapour into the cylinder, while, by closing late, we get a better charge of gas. This may be explained by the fact that, owing to the inertia of the vapour, the gas will continue to enter the cylinder after the piston has reached the dead centre.

and a slight pressure will be formed by the returning piston before the inlet valve is closed.

With regard to the exhaust valve, this is set to open 15 mm. from the bottom on the explosion stroke, and to close on the dead centre at the top of the exhaust stroke. By

Fig. 3.—Diagram of Valve Timing of Aster 18-22-h.p. Engine.

opening the exhaust valve in this way no loss of power is experienced, and a more thorough discharge of exhaust gas is insured.

For slower speed engines the setting we adopt is as follows:—Inlet valve opens 1 mm. down the suction stroke, and closes 1 mm. up on the compression stroke. The exhaust valve opens 15 mm. from the bottom on the explosion stroke and closes on the dead centre at the top of the exhaust stroke. It will be noticed that the setting of the exhaust valves is identical in both cases, only that relating to the inlet valves differing, so as to give the highest power at all speeds.

The Straker-Squire "C.S.B." Car.

Messrs. Sidney Straker and Squire have furnished us with the following information with regard to the timing of the exhaust and inlet valves on the Straker-Squire "C.S.B." cars:—

The exhaust valves, tappets and cams are designed and made of the dimension, length, and shape to give the following data: Lift of exhaust valves, 8 mm.; exhaust advance, 56 deg. on the crankshaft, corresponding on the stroke of the piston to 24 mm. before the bottom dead centre; retard on closing exhaust, 6 deg. on the crankshaft, corresponding on the piston stroke to $\frac{1}{2}$ mm. after the top dead centre; total exhaust stroke, 242 deg. on the crankshaft. Play between the tappet and the valve when the cam does not act on the tappet, 1 mm.

Adjustment of the admission.—Data relating to the full admission, i.e. when the eccentrics of the inside shaft are at their top dead centre: Lift of the inlet valves, 7 mm.; retard of opening of admission, 20 deg. on the crankshaft after the top dead centre, corresponding to 4.5 mm. of the stroke of the piston after this dead centre; retard on the closing of the admission, 20 deg. on the crankshaft after the bottom dead centre, corresponding to 3.25 mm. on the stroke of the piston after this dead centre; total admission stroke, 180 deg. on the crankshaft. Play between the tappet and the valve when the cam does not act on the tappet, 1 mm. Play between the boss of the cam and the tappet roller, $\frac{1}{2}$ mm. The cam when completely recessed should exceed the boss by $\frac{1}{2}$ mm.

According to these data, to effect the adjustment of the admission, proceed as for the exhaust by placing the piston corresponding to the valve to be adjusted at the top dead centre of the admission stroke, taking as a basis for the same the exhaust

stroke previously adjusted. Then put the camshaft in place so that the teeth of its gear, indicated by a mark, mesh with the teeth of the intermediate gearing bearing the corresponding mark. The admission camshaft having been fitted and giving the maximum lift in this position, then put in the tappet and the valve without the spring, the lift of which is to be adjusted, then turn with the hand the back-bevel pinion of the shaft carrying the eccentrics, until the valve gives a lift of 7 mm. At this moment the eccentrics will be at their top dead centre for the position of full admission: the transverse shaft worked from the handle of the flywheel for the variable admission and compression relief is to be put in place by meshing its bevel pinion with the pinion driving the eccentrics in such a position that at this moment the finger, which should effect the compression relief, is in the position to press on the exhaust shaft. By keeping this shaft fixed in this position the proper adjustment of the valve, previously fitted, will be secured by proceeding in the same manner as previously described for the adjustment of the exhaust; but the advances and the retards of the exhaust marked on the rod will be replaced, in the direction where they should be marked on this rod, by the retards on the opening and closing of the admission.

The Thornycroft Cars.

Fig. 4 depicts the arrangement adopted for the engines of the petrol cars built by Messrs. J. I. Thornycroft and Co. The outer circle represents a disc supposed to be fixed to the end of the crank shaft and to rotate with it; the pointer is supposed to be fixed to any convenient stationary part of the engine. If the disc and crankshaft be now rotated clockwise, when the radial line on the disc representing "exhaust opens" arrives at the pointer the exhaust valve should just be on the point of opening. Continuing and following the closed spiral line, exhaust closes, inlet opens and inlet closes at the respective radial lines. In practice, Messrs. Thornycroft set the valves in this manner, using, however, the edge and not the face of a standard reference disc, which can be bolted to any engine for the purpose

Fig. 4.—The Thornycroft Valve Timing Diagram.

of valve setting. As will be seen, a relatively late opening of the inlet valve—35 deg. down on the suction stroke of the piston—is adopted, while it is timed to close 15 deg. up on the compression stroke. As for the exhaust valve, this is set to open 44 deg. from the bottom of the firing stroke, and to close late—13 deg. down on the suction stroke.

THE "AMPERE" PETROL CAR.

A NOVEL SYSTEM OF CHANGE-SPEED GEAR CONTROL AND TRANSMISSION.

ONE of the most interesting exhibits at the recent Paris Show, and one which seems to have been overlooked by many visitors, was that of the Société Etablissements "Ampere," of Billancourt, near Paris, who are building a petrol car known as the "Ampere," in which a number of exceedingly novel features have been incorporated. So far as the general

Fig. 1.—Sectional View of "Ampere" Electrically-Controlled Gear-Box.

outline of the vehicle is concerned, this follows what may be termed standard lines, viz., a 10-16-h.p. four-cylinder engine located under a bonnet in the front, a gear-box at about the centre of the frame, and a cardan shaft which drives the rear axle through bevel gearing. There, however, the similarity ends, for the ordinary change-speed lever, the clutch and the differential gear are conspicuous by their absence, their functions being effected electrically by the method described below.

Fig. 1 gives a sectional view of the gear-box—the pinions of which are always in mesh—giving three speeds forward and a reverse with a direct drive on the top speed. Mounted on the main shaft in such a way that while they are free to move laterally while always rotating therewith are four discs, each forming one half of a magnetic clutch, the other of which is connected up with one of the pinions COGJ. The various speeds are brought into action by means of a switch on the steering wheel. The first speed is obtained by passing a

Fig. 2.—Sectional view of Half of Rear Axle of "Ampere" Car.

current through the clutch A, the disc free to slide being then attracted to the other and the power transmitted through the pinions CD and thence through the spur wheels IJ, which convey it to the cardan shaft; similarly the second speed is got by the clutch EF and the pinions GH. The third speed is secured by connecting up the clutch KL, when the drive is direct from the engine to the cardan shaft. For the reverse motion the clutch MN is engaged, the transmission then taking place through the pinion O, an intermediary one not shown, and the gear wheel P.

The feature of the rear live-axle (Fig. 2) is that it is solid throughout, instead of being built up, as usual, of two halves. As

already mentioned, there is no mechanical differential gear, its place being taken by two electro-magnetic clutches W, one at each end. When the car is travelling along a straight road both clutches are engaged and the drive is transmitted to both road wheels. When any turn is made one or other of the clutches is automatically disengaged, so allowing its respective road wheel to run free. Thus on turning the steering wheel to the right the current to the right hand clutch is cut out and *vice versa*, the outer wheel on the curve thus always driving and the other running free, while by a movement of the switch when the brakes are applied the drive to both is interrupted, so rendering the usual clutch unnecessary and reducing the tendency to skid. The makers claim that the two discs of the clutches are instantly connected or disconnected as the switch is moved from one point to the other.

The necessary current is furnished by a special design of magneto driven by the engine adapted to give two low-tension currents of different voltages—one being employed for the ignition of the explosive charge in the engine, and the other for the electrical control of the change-speed gear, for the driving of the rear road wheels and for the lighting of the vehicle.

The arrangement adopted in the Ampere car is undoubtedly novel, and if it gives the results in practice which the makers claim, it will certainly mark a step forward in the direction of simplicity in design and construction.

THE STANLEY TYRE MANIPULATOR.

WHILE the use of detachable rims, Stepney spare wheels, &c., has greatly reduced delays on the road when tyre troubles are encountered, there still remains the necessity, on arriving home, of repairing or replacing the damaged tyre. While this is to the amateur no light task, when dealing with a tyre on the road wheel itself, the work of replacement is even more arduous when it has to be done on a detachable rim or spare wheel, and it is to facilitate the operation in the last-named instances that Mr. F. W. Stanley, of Caxton House, Westminster, S.W., has designed an apparatus which he has named the "Stanley Tyre Manipulator." This consists of an iron stand, on which is mounted a special bracket with clamps, by means of which the rim or spare

wheel can be rigidly held at a convenient height in a vertical position. Combined with the device are three oscillating cylinders which, when the new tube and cover are fixed in place, are brought into action by rotating the bracket and act as pumps, so enabling the tyre to be readily inflated. The manipulator is as ingenious as it is useful, and should find a place in many garages, both private and public.

FATHER VAUGHAN has been comparing many people to a motor-car, and suggesting that it is far more important for a man "to look to his brake gear than to his speed gear."

CONTINENTAL NOTES.

Belgian Motor-car Imports and Exports.

To the end of November last the imports of foreign motor-cars and parts into Belgium had in 1907 attained a value of £153,648, as contrasted with only £140,188 in the first eleven months of 1906. During the same period the exports of motor-cars and parts from Belgium increased from £346,492 to £397,792.

The Lighting of Motor-Cars.

The Automobile Club of Milan is organising a competition, to be held during the coming spring, of the best means of lighting motor-cars. The event is divided into three parts:— (1) The best generator; (2) the best lamp; (3) the best system for lighting motor-cars. The executive committee consists of Messrs. Silvio Crespi (president), Fazio dal Pozzo, Dr. Alberto Pirelli, Luigi Brigatti, and Count Carlo Sormanni.

An International Motor Insurance Society.

It is reported from Vienna that negotiations are in hand for the formation of an international motor insurance society, to comprise the members of all the national automobile clubs in Europe, and the clubs affiliated therewith. The insurance policy is to be extremely wide in its scope and the premium is to be low.

will start on February 8th. In the event of no car finishing the journey, the Coupe du Monde will be awarded to the club to which the most successful car (the vehicle which travels farthest) belongs, and a reduced edition of the cup will be awarded to the winning car. It is stated that already eighteen entries have been received for the race, which in some quarters is being regarded as a somewhat foolhardy and unnecessary event.

The A.C.F. Grand Prix Race.

The Sporting Committee of the A.C.F. has worked out the sizes of engines which will be eligible for the Grand Prix race, taking as a basis the 155 mm. maximum bore for four-cylinder engines, as follows:—

Single-cylinder engines, maximum bore 310 mm.				
Twin	"	"	"	219 "
Three	"	"	"	179 "
Four	"	"	"	155 "
Six	"	"	"	127 "
Eight	"	"	"	110 "

A Tour of France.

The Autocycle Club de France is organising a tour of France to be held from the 4th to the 9th May next. The event will be open for (1) motor-bicycles of a maximum cylinder capacity of 250 cubic centimetres; (2) ditto up to 210 cubic centimetres; (3) tri-cars up to 500 c.cm.; (4) voiturettes up to

Touring in Bohemia.—A Fiat Car near Pommerndorf.

[Allgemeine Automobil Zeitung.]

Automobile Regulations in Denmark.

Apparently the lot of the Danish motorist is not a bed of roses; the present regulations regarding motor-cars in Denmark restrict the speed to nineteen miles per hour, while not only are many of the roads closed to automobiles, but during eight months of the year they must not travel between sunset and sunrise along roads that are not officially lighted. Automobilists were hoping for better times when Parliament came to reconsider the question, as it had to, before the end of the current session, but their hopes have been dashed to the ground by the Minister of Justice, who introduced his new scheme last week. Not only are the old restrictions to be maintained, but the fines are to be increased, while two convictions in one year will result in the withdrawal of the driving licence. The only freedom motorists in Denmark will enjoy will be during the military manoeuvres, when those taking part in them with their cars can legally ignore all rules.

The New York—Paris Motor Race.

The "Matin" of Paris has this week published the programme and rules of the motor race from New York to Paris, via Seattle, Skagway, the Behring Straits, Yakutsk, Irkutsk, Tomsk, Moscow, St. Petersburg, and Berlin. The European cars entered for the race will leave Havre on February 1st for New York on the Transatlantic steamer "Lorraine." The race

4½-h.p.; and (5) ditto of a maximum cylinder bore of 100 mm. for single-cylinder engines, 80 mm. for two, and 65 mm. for four-cylinders.

Miscellaneous Items.

The Austrian Automobile Club is organising a motor tour through Bosnia, Herzegovina, Dalmatia and Montenegro for May next.—The annual tax on motor-cars in Spain is being increased by more than 50 per cent.—Rigal has arranged to drive a Clement-Bayard car in the important races of the coming season.—It has been decided that the annual automobile meeting at Ostend shall commence on July 14th next.—La Société des Transports Automobiles, Services Publics par Automobiles, is the name of a company which has lately been formed in Paris with a capital of £16,000.—The Automobile Club du Nord (France) is organising a free course of lectures at Lille and Roubaix for young men anxious to become *mecaniciens*.—Three Fiats, three Italas and three Isotta-Fraschinis have so far been entered for the Targa Florio race, which is to be held in May next.—The authorities of the Swiss Canton of St. Gall have issued an order rendering it illegal to use armoured non-kid tyres or bands on the wheels of motor-cars.—A 24-40-h.p. Fiat car, fitted with a new design of spring wheel, known as the "Antopneumatica," is at present making a trial run from Rome to Paris.

MANY motor-cars were seen around the lakes and ponds near London during the recent cold weather—their passengers skating meanwhile.

"Is your horse afraid of motor-cars?" asked the tourist who was mending a tyre. "No," answered the farmer, "he's hauled too many of them home for that."

A L.G.B. inquiry will be held on Tuesday next with regard to an application by the Surrey County Council to put into force a ten-mile speed limit in Bridge Street, East Moseley.

THE National Motor Academy of Notting Hill has recently added a 40-h.p. F.I.A.T. to its already large stud of instruction cars. These now number eight, six being four-cylinder cars and two two-cylinder cars.

THE Daimler Company have received an order from Messrs. Eastwood, Swinger and Co. for a 30-h.p. live axle car of the "Blackdown" landaulet type for the use of Mr. A. Swinger, J.P., of Smalley Hall, Derby.

THE number of driving certificates issued by the Royal A.C. last year was 1,166, this number including 609 motor cabmen. The number of mechanical proficiency certificates issued during the same period was 140.

THE large motor garage of Mr. W. H. Stones, at Taunton, was destroyed by fire last week. Fortunately the stock of petrol was lodged some distance from the main building, and the brigade prevented the fire reaching this.

MR. E. LISLE has told the representative of a Wolverhampton journal that the prospects of the Star Engineering Works for 1908 are bright. The increase for the past quarter justifies the view that there will be a much larger output for this year.

ELSEWHERE in the present issue we commence the publication of an interesting article describing a series of tours within a radius of forty miles of Paris. It is from the pen of Mr. Francis Miltoun, and first appeared in our American contemporary, "The Automobile."

IN opening the Dublin Exhibition, the Earl of Aberdeen said he had had satisfactory experience with regard to a well-known make of car, the Daimler, but that did not prevent him speaking warmly of the Richard-Brasier car, with which he had enjoyed delightful runs with his friend Mr. White, or the Unic of his private secretary, Mr. Green.

MESSRS. JARROTT AND LETTS have received a repeat order from the Right Hon. the Earl of Dunraven for a 40-h.p. Crossley car to be ready for his journey to the south of France next month. The vehicle is to be of the open type with Roi des Belges body, Cape cart hood and glass wind screen.

THE 1908 pocket-book of the Continental Tyre and Rubber Company (Great Britain), Ltd., is to hand in the usual convenient form, and emphasising the added reputation of the Continental tyres during the past year. From the page of information we learn that at Cordingley's Motor Show of April last 35 per cent. of the cars exhibited were fitted with these tyres.

FROM the Calmon Asbestos and Rubber Works, Ltd., of 1, 2 and 3, Trinity Place, Tower Hill, E.C., comes the 1908 catalogue and price list of the Calmon motor tyres. These are guaranteed for 3,500 miles if driven in one year under certain reasonable conditions. The pneumatic tyre is made with a plain round tread, square treads of both the plain and ribbed variety, and also steel studded to obviate skidding. Attention may also be called to the Calmon solid tyres.

THE Duco motor accessories for 1908 are illustrated and described in a handy catalogue of pocket size issued by Messrs. Brown Bros., Ltd., from whose depot at 15, Newman Street, Oxford Street, W., all these excellent specialities can be obtained. These include lamps, accumulators, horns, coils, dry batteries, the Albo-Luthi sparking plug, voltmeters, jacks, the "Atlas" combined pneumatic and screw jack, the Duco turntable, and a host of snail tools for motorists—the whole forming a very comprehensive list easy of reference.

HERE AND THERE.

THE statement that the King favoured the proposed motor road to Windsor has been denied by Lord Knollys on behalf of his Majesty.

SEVERAL cars are employed by Messrs. Crabtree and Son, of Church Terrace, Wisbech, in the hiring business they conduct in connection with their motor garage.

MESSRS. ROWLAND BARNETT AND CO., LTD., 3, Hanover Square, Newcastle-on-Tyne, have been appointed agents for the counties of Northumberland and Durham for S.C.A.T. cars.

THE French Automobile Club has voted a sum of £1,200 towards the cost of the new roads out of Paris, which are to be constructed by the French Ministry of Public Works.

Few people know how much of the front-seat passenger's comfort depends on the provision by the makers of good high side doors to the driving seats. Often no doors of any kind are supplied, and, even when they are fitted, they are generally too low to be of much good, and in addition to this they usually spoil the smart appearance and general symmetry of the coachwork, as the lines set out by them are not in keeping with the

rest of the carriage. The difficulty is to make side-doors of such a kind that the change-speed lever and brake can be operated in comfort without the off-side door getting in the way. The near-side door does not, of course, offer any difficulty to designers, and it is merely a question of that on the driver's right-hand side. Messrs. W. T. Clifford-Earp, Ltd., are fitting a good device to all standard bodies supplied with six-cylinder Thames cars. The "gate" change-speed lever works inside the door, and the brake lever is outside. As will be seen from the accompanying illustrations, the top of the door comes level with the top of the dashboard, and the door itself is carried back in a graceful curve to the body at the side of the driver's seat. The near-side door opens in the ordinary way, but that on the off-side drops down into its place, and is kept secure by the support of the glass wind-screen fixture.

MR. C. J. PAFFARD, who introduced Dr. Winter's speed indicator and distance recorder to motorists at one of the early Metropolitan exhibitions, has a fully-equipped garage and motor engineering works at Castle Street and Mill Street, Trowbridge. He is undertaking all classes of repair work, and is keeping a large stock of spare parts and accessories.

MAY is being suggested in Dublin as a suitable month in which to hold the Irish Reliability Trial this year.

GRAVESEND has a new garage, opened by Mr. Spencer, of the Pelham Motor and Cycle Works, in the New Road.

LORD HAMILTON OF DALZELL has recently purchased a 24-30-h.p. Leon Bollée landaulet from the Victoria Carriage Works, Ltd.

THE Peterborough City Garage Company, Ltd., of Cowgate, Peterborough, have been appointed official repairers to the Royal A.C. They have a well-equipped garage in the city.

THE toll bridge spanning the Suir at Waterford was declared free at the beginning of the year, the mayor and corporation being the first to cross at midnight in a number of brilliantly illuminated motor-cars.

A PARTY of journalists who had been to Kirkby Stephen motored a few cold nights ago to Carnforth. The car broke down six miles north of Kendal, and they realised during their long vigil something of the dreariness of the Arctic regions.

THE magistrate at Clerkenwell Police Court has sent a motor-bus driver to prison for a month for being drunk while in charge of his vehicle. His licence has also been revoked. Similar procedure is promised to all succeeding delinquents.

THE Sheffield Motor Company, Ltd., are opening new garage, workshops and showrooms in West Street, Sheffield. A special motor body building department is being established, and every equipment provided for carrying out efficient repair work.

THE Earl of Elgin, the Secretary of State for the Colonies, is inviting suggestions with regard to the development of the petroleum industry in the Colonies. Important investigations on the subject are now being conducted in West Africa and in Trinidad.

A PLEASING and attractive card tray, cast in aluminium, has been devised by Mr. Robert W. Coan, the well-known worker in that metal at 219, Goswell Road, Clerkenwell, E.C. It has a

representation of a car on the track, and measures 12 by 8 in., suggesting a neat form of advertisement to the motor industry, and one that the provincial trade especially should appreciate.

COMMENCING with the first day of the present year the Board of Trade Returns will distinguish between complete cars, motor-car chassis, and the parts thereof—a triple classification in place of the inclusion of chassis as “parts,” which has hitherto been the case.

At a meeting of motor-cab drivers at Kennington on Saturday night, a resolution was adopted asking the Home Secretary to frame a short Bill to legally define the position of motor-cab drivers—to state definitely whether they were motor-car chauffeurs or hackney coachmen.

At the annual distribution of prizes to the apprentices at the carriage and motor-car body factory of Messrs. Atkinson and Phillpson, Newcastle-on-Tyne, Mr. W. Phillpson referred to the progress that British builders had made in the latter departments, and also to the special department of the firm for dealing with that branch of industry.

THE question of the payment for the petrol used for the Irish Solicitor-General's motor-car at the recent North Tyrone election has just been debated before the Derry Recorder. The amount claimed was £3 14s. For the defence it was contended that the motor-car was hired in Belfast at four guineas per day, including petrol. Mr. Burke held the Solicitor-General's agent was responsible, and gave a decree for the amount.

MR. L. E. TAYLOR has extensive motor-car showrooms in the Lincoln Road, King's Lynn.

THE Duke of Connaught is having a Harvey Frost tyre-vulcanising outfit sent out to him at Malta.

THE latest introduction of the Stepney spare wheel is a mudguard extension to prevent the splashing of mud from a Stepney wheel in wet weather.

By the Expiring Laws Continuance Act of 1907 the Motor Car Act, 1903, was continued until the 31st day of December, 1908, when it will expire unless further continued.

THE works of the Sirdar Rubber Company, Ltd., have been removed from Shirland Mews to 21, Crawford Street, W., which is near the office of the company, 34, Baker Street, W.

As instance of how the motor industry is growing in India we are informed that the Stepney Spare Motor Wheel, Ltd., have shipped no fewer than 400 Stepney wheels to India alone within the past three months.

ACCORDING to a recent report there are thirty-six motor-cars at present in use on the Island of Mauritius. The vehicle most greatly favoured is one of about 10-12-h.p., costing in Europe not more than £300.

THE garage of the Warminster Motor Works has been lately extended, and in the new department a social gathering of those interested in its welfare was recently held. Mr. L. Claude Willcox is the manager of the establishment.

MR. J. M. P. MUIRHEAD, secretary of the Automobile Club of South Africa, reports that he recently visited Mauritius and East Africa. In the former country he found about forty cars, nearly all of the same French make, and in East Africa he could only discover “two ancient vehicles of a wheezy and noisy description.”

THE R.M. Syndicate, Ltd., has entered a set of “Resilion” tyres for a long distance trial of 1,000 miles under Royal Automobile Club observation, with the option to continue for a further 1,000 miles. The tyres are fitted to a 16-20-h.p. (by R.A.C. rating 24-34-h.p.) four-cylinder Hotchkiss car. The tyres are filled with a composition made by the R.M. Syndicate, Ltd.

IN the motor notes which have appeared this week in several of the leading provincial papers we notice the following:—“Many motorists who have not yet placed their orders for their 1908 cars are looking forward to Cordingley's show, which is held at the Agricultural Hall, London, in the spring. It is certainly timed for the right season of the year to appeal most strongly to the public, the only drawback being that, in many instances, delivery cannot be promised for some weeks.”

THE Batticaloa Planters' Association some time ago asked the Government that an automobile service be given them from Batticaloa to Bibile (Ceylon), and that the motor-car which proved unsuitable for the Bandarawela-Lunugala road be put on as a trial. At the same time they pointed out there are no sharp corners or steep gradients between these two stations, and that it would bring them to within eleven miles of Lunugala, where there is an efficient horse coach service to Bandarawela and the railway. The trial has now been made, and the Acting Locomotive Engineer has reported unfavourably upon the route, dwelling at length upon the difficulty of controlling a car service in such a remote quarter, the cost of upkeep and the general difficulties of maintaining the service.

A CABLE has just been received from Mr. B. J. F. Bentley—of whose adventurous journey through Abyssinia with an 18-h.p. Siddeley car we have already given some particulars—notifying his safe arrival at Adis Abeba. His trip has aroused great interest throughout the country, this car being the first vehicle of any kind to cross Somaliland. Mr. Bentley left England in May and motored to Marseilles, and, taking boat, thence started from Djibouti at the end of August on the trip across Somaliland and Abyssinia to Khartoum, which he anticipated would occupy some seventy days. The difficulties they encountered may be judged by the fact that Adis Abeba, the point now reached, is rather less than half way to Khartoum, and the journey has already taken four months.

Correspondence.

(Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.)

THE ORGANISATION OF MOTORISTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The unfortunate rupture between the Royal A.C. and the Motor Union is now making it necessary for provincial club members to come to a decision as to which body they will support.

In the first place, it is much to be regretted that the personal element has entered so much into the controversy. The chief consideration, in my opinion, in weighing the inducements held out by the R.A.C. and the M.U. respectively is the benefit to be derived by the private owner, and it is from this standpoint and not from my official point of view that I wish to approach the subject.

When we look at the past history of the two bodies we find that the R.A.C. has voluntarily concerned itself chiefly with the developments of automobilism by means of scientific work, sporting trials, and social work of a certain kind specially adapted to the more wealthy class of motorist. On the other hand, the M.U., with the consent and encouragement of the R.A.C., has laid itself out to defend the rights of the individual motorist both in the Law Courts and the Houses of Parliament. In view of the present feeling in the country, and the possibilities of more stringent legislation, the private motorist should look upon his connection with a central body rather in the light of its power to defend his rights and liberty than as conferring 21s.

guardians of the road, as the R.A.C. will hardly consent to its own badge being used by a mere associate.

5th.—Competitions.—These may be divided into two classes. The trade trial, which is of undoubted value in the development of the motor but does not immediately concern the private user, and the Club competition, intended primarily for the local motorists but lately thrown more open to the trade, and to some extent, no doubt, abused. The first section we may well leave in the competent hands of the R.A.C., but with the second I hold they have little or no right to interfere, and I feel sure that the provincial clubs will strongly resent the recent action of the R.A.C. in prohibiting hill climbs except under almost impossible conditions.

6th.—Touring.—The club circular carefully omits any reference to the much-discussed privilege of the tryptique. We may infer from this that the privilege is not to be extended to associates, and if this is so, the remainder of the advantages under this heading can either be secured from a perusal of the hand-book or from the officials of provincial clubs, who will always be glad to furnish information.

7th.—General Committee.—On the basis of their present membership the R.A.C. will have about eighty representatives, and unless a large majority of the provincial clubs decide to affiliate under this scheme the democratic nature of the committee will be purely nominal, as the

Tryon on the 60-h.p. Six-Cylinder Napier ready to start on his attempt at the fifty-mile record.

Photo by)

AN ACCIDENT AT BROOKLANDS.

The car after the accident. The vehicle left the track on the right-hand side just by the telegraph post and leaped across the road over the heads of where the men are standing.

(Campbell-Gray.)

worth of material benefits for a subscription of one guinea. It was the need for organisation on these lines which called the M.U. into existence in the first place, and I believe it has shown itself qualified by its record of work to act in this capacity in the future. If we accept this statement of the first need of the individual motorist, we need not consider in detail the proposals of the M.U. which have been circulated to the Provincial Clubs except to say that any of the tangible benefits which the Union can afford to give to its members should be considered as so much to the good over and above the main work of the Union.

Turning to the R.A.C. scheme, which should be considered in more detail, as it is much more of a departure from previously accepted lines, we may consider the value to the individual motorist of each of the proposals therein contained.

1st.—The Journal.—This paper, while full credit should be given to those responsible for its production, is generally admitted to be of less interest than the copiously-illustrated and well-informed motor Press, which all of us read in preference to the rather uninteresting pages of the official journal.

2nd.—Hand Book.—This is certainly of great value to the touring motorist, but it will be sent to all M.U. members in 1908, and if discontinued in future under the present title there is no doubt its place will be taken by an equally useful volume for the use of M.U. members.

3rd.—Legal Department.—The Club may start a legal department if it will, but it will have to spend some time in accumulating the experience which has proved to be the chief value of this section of the Motor Union's work.

4th.—Badge.—Associates of the R.A.C. will have the right to wear a badge. No doubt this means yet another design to confuse the

Club members will practically control the new body. Further, under the R.A.C. scheme thirty-three clubs which are now affiliated will not be represented on the committee at all.

8th.—Terms of Reference.—It should be noted the words used are 'I intend that the terms or reference of the general committee shall include.' It is obvious that the actual settlement will rest with the General Council of the R.A.C., and I shall be surprised if provincial clubs will accept dictation in this way as to what subjects they are or are not at liberty to discuss in conjunction with other clubs.

9th.—Payment of Railway Fares.—This suggestion and the further Clause re fourteen days' honorary membership cannot be considered in any other light than that of an attempted "inducement" to the hon. officials of the local clubs. I hold the opinion, which is probably shared by many, that no honorary official should accept privileges not extended to all members of his club; and further, I doubt if any provincial representative on the new committee would care for the privilege of becoming a temporary member of the R.A.C. practically on sufferance; the same remarks, of course, apply to the offered accommodation in the club garage.

10th.—Under Clause 14 the General Committee are to have power to determine any question as to the area or sphere of operations of any associated body. It is obvious that this power can only affect those clubs joining under the R.A.C. scheme, and will therefore be of little value if a difficulty arises between clubs one of which is not affiliated.

11th.—Capitation Fees.—Under Clause 18 every provincial club must pay for a membership of thirty. This would press very hardly on the smaller clubs. It should also be noted that no provision is made for the affiliation of motor-cycle members at anything less than the full

rate, which would be a fatal objection to any club which included motorcyclists in its membership.

In conclusion, I would like to refer to the words used in the covering letter from Mr. J. W. Orde stating that "The main purpose of the R.A.C. in passing these proposals is to raise the associated clubs in importance." I believe it will be held by most, if not all of the provincial clubs, that nothing short of independence of any superior body will at all increase their importance, and this cannot be attained in any sense under the R.A.C. scheme.

Apologising for the length of my remarks, which is only justified by the importance of the subject under discussion,—Yours truly,

J. E. HODGKIN.

MOTORING AND THE POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would be somewhat interesting to know who devised police trap and stop-watches as an intelligent method of regulating motor-traffic. To the minds of many it rather borders upon the absurd than upon the useful. It annoys a certain number of individuals, but there is no guarantee that it does good to anybody, and we now see that this kind of espionage is a game at which two can play: witness the novel institution of automobile spies upon the police themselves. I venture to suggest a more reasonable way.

Instead of short stretches, stop-watches, and traps, let the police authority proceed quietly, inoffensively, and withal protectively towards the public; let them test the speed of motor-cars by long distances instead of short. Then with the help of notebooks, telephones, and telegraphs, four or five policemen conveniently posted at intervals of some-

The 30-cwt. Van recently supplied by Messrs. Dennis Bros., Ltd., to Messrs. W. H. Smith and Son.

This is the first petrol vehicle Messrs. Smith have had, and they report that it is giving them every satisfaction. The vehicle is fitted with a 20-h.p. four-cylinder engine with both magneto and electric ignition, and is similar in construction to the vehicle which took part in Class C in the Commercial Vehicle Trials.

thing like fifteen or twenty miles apart upon any great trunk road from London to the coast would be able effectually to control the whole journey. If the posts selected were moreover at dangerous cross-roads, &c., so much the better, but the policeman should be distinctly authorised and instructed to hold up—with the hand as a signal—all approaching motors; to require such to slacken speed and pull up if required for the purpose of better identification as to letters and numbers and making notes of the exact time of passing. The same process or some part of it having been repeated further on down the road, and the number and letter and time having been similarly entered in another constable's notebook, the journey of the motorist would thus become self-registering and sometimes no doubt self-convicting, as, e.g., for a transit of forty miles in the hour between two towns or places only twenty miles distant from each other, or proportionately for lesser distances. The motorist would carry his own condemnation with him.

This very slight and occasional interference of the police authority would be a material protection to the general public, while no reasonable motorist could regard it as otherwise than a friendly caution. This remedy for "scorcherism" is really so simple that one feels almost shy of advocating it. The policeman's note-books should, of course, be evidence and so acknowledged upon charges of driving to the common danger or at excessive speed; the legal limit as between place and place should be enforced though not too technically at any one given spot.

It would really seem that no increase of a police force would be required to carry out so very simple a system. It is not upon ordinary country roads that the "town scorcher" rejoices in his pastime, but upon the big trunk roads, as, e.g., from London to York or Brighton. I believe it would not be necessary to extend this system, but if necessary the police authority would be able to help itself in the matter, and the expense of a few extra police constables in a county would soon recoup itself in the saving of wear and damage to the roads, which is now almost entirely due to heavy motors of great horsepower proceeding at a speed of something like forty miles an hour.—Yours truly,

A COUNTY ALDERMAN AND MEMBER
OF ROADS COMMITTEE.

LOW-TENSION SPARKING PLUGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very interested in the description in a recent issue of the *M.C.J.* of the new Bosch low-tension sparking plug, as fitted to the 1908 Mercedes cars, inasmuch as in 1904 I took out a patent on a similar device, and have recently been using what I believe to be the outcome of the Simplex plug referred to. About the time I took my patent out there were several different types of low-tension sparking plugs being tried, the best known of which, if I remember correctly, were the Simplex, the Bullock, and one marketed by the Société des Téléphones de Paris, but as little or nothing has been heard of these plugs until recently, I presumed that they had met with the same limited amount of success that I did. The inventor of the Simplex plug has, however, been steadily improving his device, and a matter of three months ago advised me that he had perfected it, and offered to let me try the same. This offer I very gladly availed myself of, and in consequence have for the last eight or nine weeks had these plugs in daily use on my 20-h.p. Brotherhood car. I have had them working in connection with an Eisemann high-tension magneto, merely cutting out the high-tension circuit, and using the low-tension only. During the whole of this period the plugs have run without a single misfire, and the only detriment I have found in the arrangement on my car is that the high-tension contacts are hardly good enough for low-tension current, with the result that the spark at the plug is hardly as good as it is possible to be. I am now, however, fitting a low-tension magneto with an ordinary wipe distributor, which on a bench test showed a very greatly improved spark at the plugs, and in consequence I anticipate that it will not only improve the running of the engine, but also enable the same to be easily started up on the low-tension magneto.

Of course, there is no doubt that, if the system does prove satisfactory, it will be a very great advance in a good many ways on the present ignition systems as known, especially in regard to simplicity and reliability, whilst it would enable engines to be fitted up with a low-tension magneto ignition without the necessity of the usual complications in the shape of mechanical contact breakers.—Yours truly,

PERCY RICHARDSON.

THE RELIABILITY OF MAGNETOS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "A. W. R." as to reliability of magnetos, I have used both high and low tension magnetos and have run 10,500 miles on a Simms-Bosch high tension without the slightest adjustment, and it is still running well on a 30-40-h.p. Daimler. I have also run equally well on a low tension, and by keeping a magneto clean and well-lubricated they will run for two or three years without remagnetising.

S. H. SPRINGTHORPE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "A. W. R.'s" query as to the reliability of magnetos, my experience may be of use to him. I have a car with dual ignition, both high tension, the magneto being a Simms-Bosch. To date I have run over 4,000 miles on the latter ignition alone without a single misfire or any trouble whatever, and the same plugs are in as when the car was bought. Lubrication is the only thing that I know about it. I have never seen the inside and I don't want to. It is also quite easy to start on.—Yours truly,

CHARLES S. BARRATT.

THE INCONSIDERATE DRIVER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been called to a paragraph in your issue of the 28th of last month, referring to some remarks made by me at a lecture given under the auspices of the Education Committee at the Sutherland Institute at Longton, on November 29th last.

I should be very pleased to think that I have been unfortunate in my experience of inconsiderate drivers upon the road, and I am pleased to accept your assurance that the number of considerate drivers is greatly on the increase, and that motorists have come to recognise the need for care and thoughtfulness, not only for the safety of others, but of themselves, although it is a little difficult, in the face of the report, one sees, which go to show that there are still a great number, not only

of careless and inconsiderate drivers, but callous drivers upon the road, and these are the people we have to thank for the continuation in force of the stringent regulations with regard to the user of motor-cars.

After reading the paragraph in your paper I found in the very next motoring paper which I took up to read, namely, the Royal Automobile Club Journal of January 2nd, there were no less than three complaints of inconsiderate driving, and one may fairly assume that this forms only a small percentage of the number which actually exist, but for various reasons are not brought forward.

In my opinion it is the paid professional driver who is responsible for the public feeling which exists against motors, and not gentlemen who drive their own cars, whose intelligence naturally prompts them to have some consideration, not only for the public but for other motorists. I stated in the course of my lecture, and I am still of the same opinion now, that all motor drivers should slow down their car when meeting either another motor, or a horse driven vehicle; and, further, that every driver ought to be able to bring his car to a standstill without risk in the space of the road which is visible to him at the time. As an instance of the disregard of the latter, I was once almost run down at the Weston Crossing, near Ingestre, Staffs. It is to be hoped, therefore, that gentlemen who drive motors will become more stringent in the regulations under which their paid drivers perform their duties, with a view to effectually putting a stop to inconsiderate and careless driving.—Yours truly,
GEO. HAWLEY.

CARBONACEOUS DEPOSITS IN ENGINE CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am carrying out some exhaustive experiments on the cause of so called carbonaceous deposits in the cylinders of internal combustion engines, and I should esteem it a great favour if you would allow me to appeal through the medium of the *M.C.J.* to motorists, in order that I may ask them to send me, at Vanbrugh House, Blackheath, samples of the deposits which they have found in their engines, together with, if possible, particulars as to the make of car, type of lubrication, compression, and any other such points, as, for example, undue heating, which they might consider to have a bearing on the formation of deposit.

I may say that the result of my work will be made public, and I therefore venture to make this request.—Yours truly,
A. DUCKHAM.

MOTOR BODY DESIGN AND CONSTRUCTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much interested in your recent article on this subject. It has always been recognised that the easiest riding position upon a car is as nearly as possible half way between the rear and front axles. The jars due to road inequalities being transmitted from each axle through the springs to the body, and the effect of each irregularity being successively felt, first in front and then behind, there is a comparative freedom from shock at the central points of the chassis. This is particularly true of long wheel base vehicles, a given rise or fall of either axle representing a very small movement in the centre of the chassis. Rear seats are generally so notorious for their hard riding qualities as to be rather shunned by experienced motorists, being, as a rule, almost directly over the rear axle, and it is unfortunate that one of the two best riding seats has to be given up to the driver—only one of the passengers in a touring party being able to enjoy a seat affording the maximum of comfort.

The increase of bonnet length which comes with the use of six cylinder engines, and the fact that all bodies on high-powered cars are now required by public demand to be very roomy and to comfortably seat five persons, keep the rear seat extremely far back—the permissible length of wheel base having been reached, if not exceeded, in some designs. The rear seats somewhat overhang the back axle in not a few instances, although it is evident that a few manufacturers of touring cars have realised the advantage, in point of easy riding, of keeping the whole body within the space between the axles, and thus locating the rear seat somewhat forward of the back axle. It may be practically impossible to bring this seat sufficiently far ahead to make a substantial improvement in the comfort of its passengers, but it is certainly a move in the right direction.—Yours truly,
COMFORT.

A DE DION QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you or any of your readers inform me what occurs when the throttle is applied to a De Dion engine? Does it effect the lift of the exhaust cams or the inlet cams?—Yours truly,
ENQUIRER.

[Practically all De Dion-Bouton single-cylinder engines with atmospheric inlet valves, from the 4½-h.p. upward, have been fitted with a throttle on the exhaust valve lift, but the single-cylinder 8-h.p. engine with the inlet valve mechanically operated is controlled by a throttle on the carburettor; in this case, however, provision is made for raising the exhaust valve to facilitate starting. A diagram of the action of the

exhaust valve type of throttle, as fitted to De Dion motors, will be found in Mecredy's Instruction Book, third edition, page 12. It is also described and illustrated in "Motor Vehicles and Motors," by Worby Beaumont, second volume, pages 21 and 22. All De Dion-Bouton motors from and including the new 8-h.p. are fitted with throttles that operate on the outlet mixture of the carburettor, and are controlled by a pedal, and also by a lever on the steering column.]

DENATURED ALCOHOL AS A NON-FREEZING SOLUTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Denatured alcohol possesses great advantages over other anti-freezing solutions in the following ways:—1. It always has a constant composition, consequently when mixed with water in certain proportions the mixture will always have the same boiling and freezing temperature. 2. It has no corrosive action on any part of the circulating system, either the metals or the rubber, consequently can be used continuously without any renewal of parts. 3. Electrolytic action cannot take place when denatured alcohol is used. Electrolysis takes place whenever a salt solution, such as calcium chloride, sodium chloride, &c., is employed, and this action probably causes more wearing away of the parts than any other, and is not confined to the radiator and pump, but also takes place in the water jackets of the engine. 4. The boiling point of denatured alcohol is higher and the freezing point is lower than that of wood alcohol, consequently a mixture of water and denatured alcohol will not evaporate as readily as a mixture of water and wood alcohol, and the freezing point will be lower. 5. There is absolutely no danger of the action of heat forming any acid which would corrode the parts. 6. Denatured alcohol does not have to be filtered before being poured into the radiator, as it contains no solid matter.

Mr. A. W. Gamage's Six-Cylinder Napier. The body, which is of the limousine type with detachable top, was built by Mr. Max Graddon, of Mildmay Park, N.

7. There is absolutely no danger of its forming a film on the radiator, thus reducing its efficiency. Glycerine when used clings to the surface of the radiator and the inside surfaces of the water joints, and on account of its low specific heat lowers the efficiency of the radiator, and also prevents the carrying away of heat by the water from the engine proper.—Yours truly,
MECHANICAL ENGINEER.

MICA WIND SHIELDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Several accidents have occurred where passengers sitting beside the driver have been seriously injured by the breaking of glass wind shields. In the case of an accident the shield is almost certain to be damaged and the glass will generally inflict damage on anyone who happens to be on the car.

Cannot mica be satisfactorily employed in place of glass? At one of the motor shows I saw a shield in which mica and glass were ingeniously incorporated, but I have never seen it employed on a car. Perhaps some who have had experience of such a shield, or possibly the makers, might be prevailed upon to give their experience in your interesting columns.—Yours truly,
A. M. D.

MR. W. G. JAMES, of the Crypto Car and Cycle Company, 14, Mortimer Street, London, W., writes:—"We have had a new motor-car tyre cover stolen from our depot. We should be glad if you would mention this in your next issue, as it may not only lead to the recovery of the tyre but also to the tracing of the thief. The following is a description of the tyre:—Hutchinson cover, No. 1633, 880 mm. diameter and 120 mm. thick. The cover has a beaded edge and is covered with leather, the top surface being fitted with fibre blocks, in which are three rows of steel studs."

THE DUBLIN MOTOR SHOW.

A MOTOR-CAR Exhibition organised by the Irish Automobile Club was opened in the Halls of the Royal Dublin Society at Ballsbridge, Dublin, on Saturday last, by the Earl of Aberdeen, the Lord Lieutenant of Ireland. The Show is much larger than that of last year, examples of all the leading British, Continental and American cars being on view, interest being increased by the presence of an Irish-built vehicle.

Interest at the stand of Messrs. Straker and Squire, is centred on the 12-h.p. Shamrock car illustrated below. The motor comprises four cylinders cast in pairs, 87 mm. bore by 85 mm. stroke, the valves being arranged on one side. The ignition is by coil and accumulator,

The "Shamrock" 12-14-h.p. Four-Cylinder Car (Messrs. Straker and Squire).

the contact maker being located on the upper end of a vertical spindle driven off the cam shaft. The spindle is extended downward to operate the oil pump. The water circulation is on the thermo-siphon system, no pump being employed. The clutch is of the leather-faced cone type. The gear-box is adapted to give three forward speeds in addition to the reverse, the transmission being by cardan shaft and bevel gear to a live axle. The brakes are all centred on the rear road wheels hubs, twin brake drums being provided to each. The vehicle is built with two-seated body, and should prove a speedy little car. The exhibit of the Ariel Company comprises three models—40-50-h.p., 30-40-h.p., and 20-h.p. The latter (Fig. 2) is the first of the new

The 20-h.p. Coventry-built Ariel Brougham. The new design of the Bonnet and the position of the Radiator will be noted.

Coventry-built vehicles, and differs in several respects from the other cars, notably as regards the shape of the bonnet and the location of the radiator. The "All Irish Car," which is made by Messrs. Chambers Motors, Ltd., is a 10-h.p. two-cylinder vehicle with horizontal engine and epicyclic change-speed gear giving three speeds forward and a reverse. The Cadillac, Star and Sunbeam cars are shown by Messrs. Turner Bros. (Dublin), Ltd., a full range of Siddleys by Messrs. Booth Bros., the Unic, Brasier and Valveless by Mann and Overtons (Ireland), Ltd., the Hotchkiss and Vulcan by the London and Parisian Motor Co., Ltd. Other cars on view include the Martini, Berliet, Panhard, Aries, West-Aster, Rover, Argyll, Napier, Humber, Daimler, Gregoire, Reo, Clement-

Talbot, Minerva, Weigel, Calthorp, Fiat, Austin, Ford, Deasy, S. P. A., De Dion, Alldays, Adams Porthos, Passe Partout, Decauville, Starling, Gladiator, Swift, Sheffield Simplex, Clement and Duhanot.

Motor tyres and non-skids are exhibited by the Continental Tyre Company, Messrs. David Moseley and Sons, Ltd.—the latter firm also displaying their Universal motor rim—Messrs. J. Spencer, Moulton and Co., the Dunlop Pneumatic Tyre Company, Ltd., the Michelin Company, and the North British Rubber Company, Ltd. The Shrewsbury and Challiner Tyre Company are present with a full range of Challiner's patent detachable rims, artillery wheels and pneumatic and solid rubber tyres. Non-skids are shown by Messrs. G. Desclee and Co., the New Motor and General Rubber Company, Ltd., Mr. W. S. Cort, of Market Harborough, Messrs. Middlemore and Lamplugh (Pegasus), Samsons, Ltd., and Messrs. J. B. Brooks and Co., Ltd.

The exhibit of the Elastex Company, Ltd., consists principally of the material with which their name is favourably identified among motorists. A removable, flange rim is also exhibited at their stand. The Midland Rubber Company, Ltd., are represented by a complete range of motor tyres in the plain, grooved, and steel-studded non-skid patterns. Included in their display is the Ajax detachable rim, which has been recently described in our columns. Cans, drums, and cases used in the transport of "Shell" motor spirit are exhibited by the British Petroleum Company, Ltd., who have lately issued a series of picture postcards depicting various motoring events in which this spirit has been used. The Anglo-American Oil Company are also present in the interest of their well-known motor spirits, while Messrs. Wm. Preston and Co., Dublin, draw attention to the merits of "Carburine."

The Fastnut washer is being shown on the stand of the company under the direction of Mr. W. H. Cook, the managing director. This device is well known in Great Britain, and will certainly attract much attention on this, its first, appearance in Ireland. The well-known Albany rotary water circulating pump is shown by the Albany Engineering Company, at whose stand is also the Cave detachable "Quick Change" rim and the "Stanley" silencer. Among the other accessory exhibits we note the Rushmore lamps, E.I.C. ignitivities, Berliet lamps, the Turco electric vulcaniser, the County Chemical Company's specialities, Stepney spare wheels, the H.F. vulcanisers of Messrs. Harvey Frost and Co., Coventry Motor chains, the Auto-vice spanner, &c., of Messrs. Avery and Roberts, Ltd., a range of Messrs. Brown Bros., "Duco" accessories, the Universal valve connector, tyre tester and battery terminals of Messrs. F. S. Nickells and Co., the Veeder odometers and the "Auto Torch" of Messrs. Markt and Co., the B.R.C. Alpha lamps and Messrs. Vandervell's ignition specialities. The Show closes to-day (Saturday).

THE ACCIDENT ON BROOKLANDS TRACK.

ONE of the most remarkable accidents, happily unattended with fatal results, which has occurred to a motorist in this country took place on Thursday of last week on the Brooklands Track. Mr. H. C. Tryon was to make an attack on the records recently set up by Mr. W. T. Clifford-Earp. Starting shortly after noon on a 60-h.p. six-cylinder Napier, he was soon attaining a speed of eighty-four or eighty-five miles an hour, and all went well until in the fifteenth lap a tyre burst, necessitating a change of wheel. The fifty-mile record was beaten by a minute, and then, in the twenty-fourth lap, a second tyre went. The car was running at the top end of the track, near the grand stand, and when the tyre burst the vehicle turned completely round three times. It then slid down to the bottom of the bank, and took a flying leap right across the road, carrying with it two telegraph posts and some iron railings, ultimately falling into a bank of sand on the opposite side. Mr. Tryon, the driver, who was the only occupant of the car, fell out into the middle of the roadway over which the track proceeds, and was picked up and conveyed to an hotel at Weybridge, where it was ascertained that no bones were broken, but that his chest was badly bruised.

The Brooklands A.R.C. has officially made known that Mr. Tryon, before his accident on the 60-h.p. six-cylinder Napier at Brooklands on Thursday last week, beat the Fifty Mile World's Record, doing the distance in 37 min. 45.9 sec., equivalent to a speed of 79.43 m.p.h., with Pratt's motor spirit. The car was fitted with "Castle" coil and accumulators.

Despite the extraordinary distance the car jumped after the second burst tyre, and the way Mr. Tryon was thrown out when travelling nearly 85 m.p.h., he appears to have suffered no serious injury, and the doctor hopes soon to have him about fit and well again. There is very little doubt that it is owing to his coolness and ability in sticking to his car right up to the last that a serious disaster was averted. The accident was caused through the back tyre bursting and then coming partly off the wheel and jamming between the wheel and the frame, so that this wheel was locked just as if a violent application of the brake had been made and the car spun round on the locked wheel. From eyewitnesses and from Mr. Tryon it seems clear that the car turned completely round upon itself two or three times before leaping off the track.

We learn that the New Pegamoid, Ltd., 144, Queen Victoria Street, E.C., are placing on the market a new cloth which is a more perfect imitation of real leather than that which has hitherto been supplied. It is the result of lengthy and exhaustive experiments, and is well adapted for motor-cars, &c.

THE OUNCE OF PREVENTION.*

CONSTANT inspection is the price of successful motor-car operation, as indeed it is with any other piece of mechanism. Inspection not only reduces the liability of those derangements which might cause imperfect operation and stoppages on the road; but, what is far more important, it in a measure forestalls those imperfections which might result in accident to the occupants or damage to the car itself. Inspection for the latter class of derangements is far more imperative than for the former, and it may be well to mention a few of the matters which should be looked to particularly with an idea of protecting the passengers and the vehicle from danger.

THE STEERING GEAR.

The steering gear, from the hand wheel to the wheels themselves, must be scrutinized with the most minute attention. Every nut must be demonstrated to be in place, and its bolt, if it have one, properly secured. The ball joints in the steering linkage should be in correct and firm adjustment. If there is much lost motion between the hand wheel and the steering axle, it should be located and, if possible, removed. Frequently an adjustment is provided to take up wear in the worm gear, or whatever irreversible mechanism is provided in the steering column. The latter should be demonstrated to be perfectly tight to the frame or floor, as the case may be. Tightness in all parts of the mechanism, but still a perfect freedom of motion of the gear, should be the desideratum. If the gear springs badly when it is operated with the vehicle at rest, it should be viewed with suspicion, and if there is a large amount of incurable backlash the worn parts had best be replaced. The irreversible mechanism at the foot of the column is generally intended to be kept packed with lubricant, and every joint and pivot should be lubricated with heavy oil. In connection with the steering gear one should try both front wheels to make sure that they are fast on their axles and that there is no possibility of their working off.

THE BRAKES.

Upon the integrity of the brakes depend the lives and limbs of the occupants of the car, and no pains should be spared to make sure that they are effective. The pull rods or cables which transmit the braking power from pedal or lever should be securely attached to the mechanism which they operate, and entirely free from interference with other parts. Adjustment must be so made that the brake is fully applied before the operating pedal or lever reaches the limit of its motion. In the case of hub brakes one should see that the brake band on one wheel acts just as strongly as that on the other. If leather brake bands are used they should be kept free from oil, but if the braking surfaces are metal oil is expected to be used upon them. There is no excuse for anyone who operates with his brakes in bad order, as their condition may be tested at any moment on the road by any motorist, no matter how non-technical he may be. Do not neglect a brake because you employ it but little, but see that it is in as good condition as the other.

LUBRICATION.

The chief causes of damage to the mechanism which may be removed by inspection are the failure of the lubrication of some portion, the loosening of some part from the fastenings which normally hold it in place, and the failure of the water circulation. Upon the lubrication of each moving part of the mechanism depends its wearing-quality, and too great care cannot possibly be taken in regard to it.

LOOSE NUTS AND BOLTS.

No matter how much care is taken to prevent the working loose of nuts, bolts and screws (and the greatest pains are taken to obviate it in the best modern cars), the constant vibration occasionally causes the slackening of these important fastenings and sometimes their complete working out and their loss, with serious consequences. Nothing but a trial with a wrench or screwdriver of these bolts and screws, covering all parts of the machine, can assure one that everything is as it should be; and here it may be well to make a few remarks as to some of the conveniences which make inspection easy and conduce to its thoroughness. The vehicle should preferably be capable of being readily stripped, so that every part is easily reached, and the engine, base chamber and change-speed gear should be provided with liberal hand holes. An incandescent lamp with wire guard and a long, flexible cable is almost a necessity of a thorough inspection, as are wrenches and screwdrivers of all shapes and sizes. One should constantly be on the lookout for nuts that have dropped off or lost their lock nuts or split pins.

WATER CIRCULATION.

The maintenance of a plentiful supply of cooling water circulating energetically through the engine jacket is necessary, if injuries to pistons and cylinder walls are to be avoided. It is a part of the work of inspection to see that the radiator is full, that no leaks have developed, and that the circulating pump is doing its full duty and is properly lubricated. The belt which operates the fan should be kept well dressed and at the proper tightness, and its fastenings should be secure.

THE CHASSIS.

In the general inspection of the car, one may well begin with the chassis. The tyres should be examined for nails or other puncture-

producing objects and the sides for evidences of rim-cutting. If any parts of the tread are cut it is sometimes possible to fasten down the chipped portions with rubber cement. The front wheels may be jacked up and demonstrated to run perfectly free, but without any serious side play. If ball or roller bearings are used the ball or roller cages must occasionally be packed with grease, and should be adjusted to that degree of tightness which secures freedom from wobble, but without the least tendency toward binding. Plain bearings require very little attention other than the occasional turning of their grease cups.

If the car has a live rear axle care should be taken that its bearings are in perfect adjustment and fully lubricated. The large nuts securing the wheels to the axles should be shown to be perfectly tight. In case the axle is chain-driven one should see that the chain is neither too tight nor loose, and that it is clean and well lubricated. The link which fastens together the two ends of the chain should be closely examined to see that it is secure. The two radius rods which adjust the chain should be set up tight, and at equal length, so as to keep the axles parallel, and the differential case should be supplied with the proper amount of heavy oil to secure constant lubrication. If the car has a shaft drive, the lubrication of the bevel gears, if attended to, will probably ensure the oiling of the differential. In case of the solid axle and double chain drive, the bearings of the wheels or the axle must be attended to, but the lubrication of the differential will probably be taken care of when the change-speed gear case is supplied with oil. The springs should be inspected to see that no leaves are broken and every nut on the clips, which secure the springs to the frame and to the axles, should be left in a tight condition, as otherwise a broken spring may be the result.

THE ENGINE.

The engine should be turned over by the starting handle, and the compression in each cylinder should be proved to be satisfactorily high. If it is not, an attempt should be made to locate the escape of the gas, which, if not being lost by the piston rings, may escape past a sparking plug that does not fit tightly or through an inlet or exhaust valve which does not seat properly. Sometimes one can determine where the loss of gas is by the sound when the engine is slowly turned. The bottom of the crank case should be removed or the hand-hole cover taken off, as the case may be, and the moving parts inspected. No perceptible looseness should be allowed in the bearings or the connecting rod on the crank shaft or upon the gudgeon pin. It is of the greatest importance that the bolts holding the caps on the big-end bearings should be tight and properly locked and the caps on the crank shaft bearings in the engine base should be left in a perfectly tight condition. If any of the valves have proved to be leaky they should be removed, together with their seatings, if these be separable, and ground in by the use of fine emery and a gentle rotary motion. The bearings of the half-time shaft should be in proper adjustment, and if any part of the engine appears to have lacked oil the reason should be ascertained. If splash lubrication is employed, the base chamber, after being put together, should be filled with the proper amount of heavy, high-test oil, and any undue escape of the lubricant through joints or otherwise should be corrected; and if the oil is fed to the cylinders and other parts through oil pipes it is well to occasionally disconnect these and see that the oil is actually delivered when the lubricator is working.

SPARKING PLUGS.

Sparking plugs should be removed and seen to be clean and uncracked and their terminals adjusted at the right distance. The contact device may be uncovered, the contacts cleaned, and the connections of the wires to it demonstrated to be tight and not liable to breakage. It is well to take a look at all the wiring to see that it is not oil-soaked or that it does not pass too near any conducting part of the car. When accumulators are employed, it is a good idea to test each cell by means of a voltmeter. The cells should be packed in such a way that they cannot shift from the motion of the car, and the connections between them should be of flexible cable, provided with proper terminals. Where a dynamo or magneto is used it should have the lubrication which the makers intend, and its commutator and brushes should be in good electrical condition. The tremblers of the induction coils must be adjusted for a rather high musical note, the adjustments set very tight, and the platinum points should be carefully brightened.

CHANGE-SPEED GEAR.

The change-speed gear, if of the sliding pinion or separate clutch system, is usually in a tight case, and care should be taken that this is kept filled to the right height with thick oil. If separate metallic clutches are provided for each speed they should be kept adjusted so as to hold sufficiently, but not to require any undue force to engage them, and the adjustments should be carefully locked at the correct points. Every bearing, gear face and clutch surface should be seen to share in the lubrication. In case a planetary gear is used the straps must be adjusted at such tensions as to secure freedom from slipping on each speed, and the case should contain plenty of lubricant. The pivots of the operating mechanism which tightens the straps should be lubricated, as well as the spool and operating fingers of the high-speed locking clutch. These gears frequently have a number of oil holes, varying with different makes, and none of them should be neglected. It may be remarked in passing that the operation of lubrication, if intelligently performed, will often bring to light, without special effort on the part of the attendant, many cases of looseness of parts, excessive

*Abstract of a lecture by Mr. Albert L. Clough before the Y.M.C.A. Automobile School, Boston, Mass.

wear and other defects. One cannot completely inspect the lubrication system without viewing, and perhaps handling, most parts of the car, and in so doing one is likely to notice anything which is out of order. One should not take for granted that a force-feed lubricator, operated either by the exhaust pressure or mechanically driven by the engine, is infallible in its workings. Oil pipes will sometimes clog, and the small pumps used in the latter type sometimes fail to draw their charge of oil. One must be sure that oil actually reaches the part intended, and to this end oil magazines and their pipes should occasionally be flushed out with petrol. Oil ways and holes must be free so as to carry the lubricant to the very point at which it is needed. One should have a variety of oil cans of proper sizes and lengths of spout, so that there may be no temptation to slight any parts of the mechanism.

If a cone clutch is employed, there seldom will be any need of adjustment, but the operating mechanism which throws the clutch in and out must be oiled. Castor oil is sometimes used on the leather facing to keep it soft and make it "take hold" properly. All operating levers and their connections, including the gear-changing lever, the spark advancer, and the throttle or accelerator pedal or lever should be proved to be perfect in their working. Petrol piping and the tank should be inspected for leaks. The carburettor float chamber should occasionally be drawn off and flushed with petrol, in order to remove any water or sediment, and the spraying nozzle and chamber should be kept free of all foreign substances.

It is impossible to give any directions for inspection which will cover all makes of cars, but a short acquaintance with any particular vehicle is sure to bring out special points which need examination frequently. If, however, all parts are carefully examined in the stable at frequent intervals, there will be very few troubles met with on the road, and it should be the aim of every conscientious automobilist to secure, by his own foresight, a clean road record. Tyre troubles and rare instances of the breakage of parts, neither of which classes of troubles can be avoided by inspection, are about all the difficulties which a good driver ought to expect while the vehicle is in service. An ounce of prevention applied in the stable is better than many pounds of cure applied under the disadvantageous circumstances which the road generally imposes.

SPARE PARTS.

After all the precautions in the way of inspection have been taken, it is well to be prepared to meet ordinary emergencies of the road, and in order to do so the tool box should be liberally and judiciously equipped with the proper tools and supplies. If a long tour is contemplated through a district where repair shops are few, quite an extensive list of spare parts and supplies had best be taken. As to what parts should be chosen, nothing but experience can determine.

But it may be said that whatever part or parts of a particular car have shown weakness should be the parts carried in duplicate. An extra inlet and exhaust valve, with their springs, should be included in the kit, together with a good supply of sparking plugs, if the jump spark is used, and an extra igniter and several sets of spark points if the low tension system is employed. If the contact maker is of the type which employs a platinum-tipped steel spring and screw, these should be carried in duplicate, and it saves considerable bother if a complete contact box is carried as a spare part, as it can readily be attached in place of the old one, and less time taken than would be required to put the old one into running condition. In case ball or roller bearings are used in the car, a set of cups and cones and a supply of balls or a set of roller cages, as the case may be, may well be included. Some people carry an extra set of springs or an extra front spring at least, but these are not likely to be needed unless the car is over-driven, and they are rather cumbersome and heavy. A good country blacksmith is ordinarily able to make new springs; at least, for temporary use in case of breakage on the road.

Extra links for the driving chain and an extra connecting link should, of course, be included, and if a chain drive is used for the pump, or magneto, or for starting the engine, a duplicate should be carried. An extra belt for the air fan, if one is used, may well be provided. One should have on hand a stock of spare nuts and bolts of the sizes used in the car. Ordinarily the supply necessary to fit all parts of the vehicle will not prove burdensome. The small springs, such as used on governors and flexible pump connections, sometimes break, and duplicates should be at hand. Spare tyres are a necessary part of the touring equipment of all automobiles, and both extra covers and inner tubes should be carried, together with a small vulcaniser, patches, cement, sand-paper, extra bolts, a pump, and one of the folding jacks which are now on the market.

In addition to whatever wrenches or spanners are required to fit special parts of the mechanism, the following tools will be found useful. A large monkey wrench, a small bicycle wrench, bar or S wrenches for standard nuts, a pair of parallel jaw-cutting pliers, a cold chisel or two, a few files of different kinds and sizes, a good jackknife, a small punch or drift pin, one of the small pocket tool chests containing a variety of tools, a large and small screwdriver, and an engineer's hammer. A pocket voltmeter will not come amiss. One can add to the equipment a pair of overalls and a piece of oilcloth to kneel or lie upon when making repairs, but these "insignia of the trade" are not nearly so often needed as they were formerly.

(To be continued.)

MR. G. BRADWELL, of 5, Filey Street, Sheffield, is the agent for the Motobloc car for the counties of York, Nottingham, Derby and Lincoln.

DETERMINING TYRE TEMPERATURES.

It is a matter of common knowledge that as the result of friction both with the road surface and that produced by the relative movement of the inner tube and cover of a motor tyre, the latter reaches a high temperature when the car is run at great speeds, but up to the present little or no attention appears to have been paid to the matter of investigating this phenomenon. Observation has shown that the tyres of a racing car reach a temperature that cannot be borne by the hand placed on the outside of the cover, which would appear to indicate that the temperature of the interior of the tyre might at times approach perilously near to the melting point of the rubber itself. In fact, some motorists have accepted this theory as being responsible for the partial dissolution of the inner tube generally termed "blowouts," but experience proves this to be erroneous, many of such injuries being nothing more or less than the result of carelessness in replacing the tube in position, as a consequence of which a portion of it becomes pinched. It is, in consequence, of interest to learn that M. Lucien Périé, secretary to the Technical Commission of the Automobile Club of France, has devised a means of investigating tyre temperatures somewhat more closely than the present method of feeling the exterior with the hand.

Writing of his experiments in the *Bulletin Officiel de la Commission Technique*, he says:—"I have combined this device by means of utilizing a Sclavander pressure indicator and a thermometer, with the aid of M. Morin, the maker of the former useful instrument. The pressure gauge consists of a needle operated by an exterior button passing through an air-tight joint and so placed as to operate the stem of the valve, while the instrument itself is designed to be screwed on the shell of the latter in place of the cap. In order to avoid the necessity of removing the instrument when it is found that the pressure of the tyre is insufficient, a side outlet has been provided on the stem of the pressure indicator. Ordinarily this is closed by a regulation style cap, which may be removed whenever further inflation is necessary. It is to this opening that I have applied my temperature-determining apparatus, which consists of a chamber communicating with the atmosphere through the medium of a pet-cock. In the centre of the chamber in question there is placed the bulb of a thermometer graduated to 120 deg. Centigrade. The thermometer is held fast in place by a packed joint and protected from injury by a casing.

In order to ascertain the temperature of the interior of a tyre immediately after the conclusion of a race, or after having been run at high speed for any length of time, it is only necessary to remove the valve cap of the tyre and substitute in its place the pressure gauge, press the button in order to permit the hot air from the interior of the tyre to escape into the chamber containing the thermometer, and a double reading may be taken—that of the pressure of the expanded air and its temperature. In order that the matter may more closely approximate the exact temperature of the interior of the tyre, it is necessary to open the petcock slightly, thus allowing the air to escape slowly. Otherwise the metal of the gauge and of the containing chamber would be apt to rob the small amount of air necessary to fill the chamber of such a large proportion of its heat as to render the reading worthless. After the air has been escaping through the pet-cock for half a minute or so, the entire apparatus reaches a uniform temperature and the reading practically represents the condition of the interior of the tyre. Experiments with the device should reveal some interesting facts in this connection, as little or nothing is definitely known on the subject of tyre temperatures apart from the fact that it is a matter of common knowledge they do get most uncomfortably hot when run very fast—a condition that is not conducive to longevity.

THE MERVYN O'GORMAN TROPHY.

RECENTLY we announced that Mr. Mervyn O'Gorman had offered a trophy to the R.A.C. for competition on the Brooklands Track or such other place as may be agreed to by the Club. The competition must be held between May 1st and July 31st, and no limitation will be placed on the form or description of the motive power of the vehicles entered, provided that it be wholly mechanical, nor will any regulation be made with regard to the kind of fuel used. The distance is to be not less than 100 miles, and the time and speeds obtaining during the race are to be noted in such a manner that the records obtained for distances less than 100 miles may be obtained and placed to the credit of those obtaining such records. As we went to press the Brooklands A.R.C. intimated that the event would be run off on August 3rd.

OBTAINING CARS BY ALLEGED FALSE PRETENCES.

A SENTENCE of six months' imprisonment was passed at the Warwick Quarter Sessions on Albert Goddard, who was charged with obtaining by false pretences a motor-car valued at £760 from the Daimler Motor Car Company's works at Coventry. The car was abandoned by prisoner at a hotel at Southwell, near Nottingham.

JOHN PARROTT, an engineer, was charged on the 2nd inst. on a warrant at Marlborough Street with having, between November 28th and December 5th, fraudulently converted a motor-car to his own use at Oxford Street, London. He had been arrested on returning from New York and was remanded.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING SPEED LIMIT.

At Kingston-on-Thames County Police Court ten motorists have been convicted of exceeding the speed limit, and fines, exclusive of costs, were imposed totalling £47. All the defendants pleaded guilty, and the batch of summonses was disposed of under the half-hour. The fines ranged from £6 to £3 according to the speed.

There is a measured furlong in St. John's Wood for motoring along which at a speed beyond the legal limit a motorist has been fined £30 and costs.

For exceeding the motor-car speed limit of ten miles per hour, at Newmarket, two motorists have been fined £3 each.

APPEAL ALLOWED.

At the West Sussex Quarter Sessions at Chichester, on the 2nd inst., before Judge Lumley Smith and other magistrates, Mr. T. E. Comins, of Rodenhurst Road, Clapham Park, S.W., appealed against a conviction at the Horsham Bench on October 12th, 1907, for unlawfully driving a motor-car on the public highway at Ruspur in a manner dangerous to the public.

Mr. Leonard Costello was for the appellant, and Mr. Horton Smith for the respondents. The appeal was made on three grounds:—(1) The decision was contrary to the weight of evidence. (2) The conviction was wrong according to law, as it was not shown by the prosecution that any member of the public was in danger. (3) Under the circumstances the fine inflicted was grossly excessive. After the evidence in support of the conviction Mr. Costello addressed the Court on behalf of the appellant, who, he said, did not rush about the country disregarding the safety of his fellow citizens, but was a quiet, ordinary business gentleman, who indulged in motoring for the pleasure of himself and his family. He submitted that the fine of £10 and costs was in a case of this kind excessive. He also suggested that the proceedings against his client were instituted by the owner of a dog by way of punishing the motorist for having killed the dog. Since these proceedings had been going on a civil action had been instituted by the owner of the dog for the recovery of what he considered the value of the animal, and he maintained that he ought not to be allowed also to penalise his client in a criminal court. The appellant, his wife, and Mr. and Mrs. F. W. Plaw having given evidence, the Chairman said he thought the matter was ripe for the Bench to decide without any speeches from counsel. The magistrates accordingly retired, and after an absence of only a few minutes they returned, and the Chairman announced that they had decided that the appeal should be allowed. The Court also decided to allow costs.

FOR HE'S A CHAUFFEUR NOW.

I went back to the village, Tom,
The spot we cherished so,
And hunted up our boyhood friends
Of twenty years ago!
The crowd who tilled the soil with us
Are scattered, I avow!
The motor craze has struck the town,
And they're all chauffeurs now!

You recollect Jim Buzby, Tom,
At whom we used to scoff!
They sold him out at auction once
To clear a mortgage off!
He's liquidated all his debts,
I can't just tell you how,
But he's become a millionaire,
For he's a chauffeur now!

I ran across old Billy Sprigg,
With Mary on his arm.
She used to be a milk maid, Tom,
Down on his father's farm.
She solemnly declared that she
Had never seen a cow,
Bill must be making money, Tom;
For he's a chauffeur now!

While rambling through the old churchyard,
A horror seized my frame!
There stood a granite monument
Which bore Jim Simpson's name.
His motor-car exploded, Tom,
I learned from Davy Slough;
No doubt, if Jim had been alive,
He'd be a chauffeur now.

The county court house which they planned,
You surely can't forget;
They broke the ground when we were boys,
And 'tisn't finished yet;
Mechanics, Tom, are pretty scarce,
As all the folks allow.
They can't get men to do the work,
For they're all chauffeurs now!

FRANK G. WELCH in the "Carriage Monthly."

TEN COMMANDMENTS FOR TYRE USERS.

WHAT might be termed the ethics of the tyre problem are embodied in the text of a cleverly devised show card which the Firestone Tyre and Rubber Company, a leading American concern, is distributing to be hung in garages and such other places as will keep it before the eyes. It is known as the "Chauffeur's Moral Code," and reads as follows:—

(1) I will not overload or overspeed my vehicle, because this will be harmful to the mechanism and tyres. I realise that a good tyre has a certain amount of "life," and if persistently overworked it cannot recover.

(2) I will always keep the brakes working evenly and the axles and wheels "trued up." I can thereby save rack and wear on my vehicle and prevent unnecessary strain on any one of the tyres.

(3) I will not allow oil or grease to accumulate on my rubber tyres, as this will eventually cause decay.

(4) I will never expose my tyres to burning heat, as the wear-resisting properties of the rubber would thus be destroyed.

(5) I will always remember to start my vehicle in a straight line before turning the steering wheel; because by turning front wheels when the vehicle is standing still, a heavy and unnecessary strain would be placed upon the tyres.

(6) I will start and stop my vehicle gradually and avoid jerky motions under all circumstances.

(7) I will not persist in running my vehicle along tram rails, as that would grind down the edges of the tyres.

(8) I will always, when possible, choose a smooth pathway, avoiding obstacles and road irregularities; and will cross tram lines preferably at an angle.

(9) As merely resetting or repairing a tyre will in many cases double its life, I will have my tyres attended to promptly when damaged, in order to secure the greatest amount of service from them.

(10) And, above all things, I will use my influence to have my vehicle equipped with the best tyres made—viz. the

COMPANY NEWS:

THE RILEY CYCLE COMPANY.—Mr. Victor Riley has been elected to the directorate of the Riley Cycle Co., Ltd., at the annual meeting of which the chairman, Mr. Basil Riley, referred to the improved position of the company as compared with the corresponding time of last year. They were now able to make and deliver cars, including the 12-h.p. vehicle, to the features of which much attention has been given of late.

TREVOR.—This company has just been registered, with a capital of £1,000, to establish and carry on schools for the purpose of providing instruction, advice, and assistance relating to motor-cars, aeroplanes, airships, and other mechanically-propelled vehicles.

ELLEHAM AUTO-CYCLE COMPANY.—£5,000. To acquire from D. Adler exclusive right to use two inventions of T. C. H. Ellehammer, of Copenhagen (1) relating to compression release valve, and (2) relating to carburettor.

FALMOUTH AND PENRYN MOTOR COMPANY.—£2,500. 23, Church Street, Falmouth.

ECCLESTON MOTOR CAB COMPANY.—£6,000. Northumberland Chambers, Northumberland Avenue, W.C.

PICKARD'S TAXIMETER.—£70,000. Agreement with Taximeter Patents, Limited, to acquire inventions for manufacture or use of carriage taximeters and similar apparatus. 17, Waterloo Place, S.W.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

IN order to remove any misapprehension as to the scheme of association, the Royal A.C. states that the General Committee to be formed under the new scheme is intended to be a body composed of representatives of the Club, of all associated bodies, and of individual associates. All these bodies are represented on this committee on an equal basis. The individual associates will be represented in the proportion of one for every hundred such associates. This committee will consider matters which may require united action on the part of motorists in the United Kingdom; the consideration of matters of general policy regarding automobilism; the safeguarding of the rights of motor-vehicle owners in the United Kingdom; Parliamentary and Local Government proceedings affecting motorists generally; the consideration of legal cases submitted by the R.A.C. or an associated body or any associate, with a view of rendering assistance if considered desirable; the arrangement of general meetings in the United Kingdom; the control of a fund comprising the capitation fees and such sums as may be contributed by the R.A.C.

A paper will be read at the Club on every Thursday evening, save one up to the first week in March. The series opened with a paper on Thursday, the 9th inst., by Mr. G. Stewart Ogilvie on "Resilient Wheels." Arrangements thereafter have been made as follows:—Jan. 23rd, Mr. G. H. Baillie on "Some Features of 1908 Motor Car Engines"; Jan. 30th, Mr. F. R. S. Bircham on "Handicapping for Motor Boat Racing"; Feb. 6th, Mr. Philip Dawson on "The Electrification of Railways"; Feb. 13th, Mr. Wyatt on "Magnets"; Feb. 20th, Mr. H. R. de Salis (Motor Yacht Club) on "The Inland Waterways of England and Wales"; Feb. 27th, Mr. Mervyn O'Gorman on "Gear Transmission"; and March 5th, Dr. William Watson, F.R.S., on some subject to be announced later on.

MOTOR UNION.

THE Sussex, Lincolnshire, Welsh, Ipswich and Suffolk Automobile Clubs and the Southend and District Motor Club have decided to support the Motor Union. The Yorkshire A.C. will continue its membership under the existing arrangement.

THE AUTO-CYCLE UNION.

THE Committee of the Auto-Cycle Union is taking steps to carry on the dinners and entertainments formerly given by the well-known "Bath Road" Cycling Club to the road-menders who work on the Ripley road. The annual dinner will be held at the Hotel Cecil on Saturday, February 15th. A council meeting will be held in the afternoon, probably also at the same place.

The scheme of association recently issued by the Royal A.C. has been brought before the Committee of the Auto-Cycle Union, which has appointed a sub-committee to consider the matter and report.

The next quarterly trial will be held on Saturday, January 25th, and will take place over the usual route, starting from the Chequers Hotel, Uxbridge, to Banbury, and back via Bicester, Aylesbury, Berkhamsted, Chesham, and Amersham.

THE CYCLE TRADE BENEVOLENT FUND.

THE negotiations that have recently taken place between the representatives of the Society of Motor Manufacturers and Traders and of the Cycle Trade Benevolent Fund have resulted in a satisfactory agreement being arrived at whereby it is intended to bring forward at the annual general meeting of the fund, to be held on the 29th inst., proposals to change the name and constitution of the fund so that members of the motor trade will be admitted on the same basis as members of the cycle trade.

The C.T.B.F. having now accumulated funds exceeding £4,000, the S.M.M.T. will make a donation of £2,000, leaving a similar £2,000 to be voluntarily donated to the fund by individual members, firms, and companies in the motor trade, in order that the motor side of the fund shall have contributed the same sum of £4,000 that has already been contributed by the cycle trade, whereupon it will be arranged that the council of the fund will comprise ten members elected by the motor trade and ten by the cycle trade. Pending that development, the £2,000 put down by the S.M.M.T. will entitle it to nominate five such councillors as against ten elected by the cycle trade.

BROOKLANDS.

THE Racing Sub-Committee, of the B.A.R.C. has resolved that the matches in the 26-h.p. and 40-h.p. Standard Class between the Métallurgique Company and Mr. S. F. Edge, and in the 90-h.p. Standard Class between Fiat Motors, Limited, and Mr. S. F. Edge, shall be run off at the Whiteauntide meeting.

The O'Gorman Trophy will be contested on August 3rd.

Mr. W. T. Clifford-Earp will attack the fifty mile record established by Mr. H. C. Tryon on the 2nd inst.

THE North London A.C. will hold its annual general meeting at the headquarters, the Fox Hotel, Palmer's Green, N., on Wednesday next.

SOUTHERN.

ON Wednesday of last week the Southern Motor Club gave a farewell dinner to their hon. sports secretary, Mr. S. W. Phillpott, at the Boulogne Restaurant, Gerrard Street, W., on his leaving London to take up a position with a motor company in the North of England. Nearly all the town members of the club were present, Mr. F. C. Pattison, sen., being elected to the chair, supported by Mr. Geo. Fisher in the vice-chair. After the usual toasts had been honoured, the Chairman referred to Mr. Phillpott's valuable work for the S.M.C. especially with regard to the open hill climb last year, and the club events, all of which he carried through with success, and assured him that he would be greatly missed with his travelling workshop and ever ready tow rope. The club could ill afford to lose such a good sportsman and worker. Other speakers followed and referred to the work done by the guest of the evening.

Mr. Phillpott, in rising to return thanks, said that the dinner was a complete surprise to him; the only intimation he had of anything being in the air was a telephonic enquiry as to whether he had "a night after Christmas with nothing on." Referring to the sporting events of 1907, he said the work was really one of the greatest pleasures of the season to him, and that he should always look back on his connection with the club with satisfaction. If any members were in Liverpool at any time he would be very glad to see them and make their stay a pleasant one. After his health had been drunk with musical honours, Mr. Phillpott left with his secretary to catch the express.

It was then proposed by Mr. Holt and seconded by Mr. Lorkin and carried *nem. con.* that Mr. S. W. Phillpott be elected an hon. member of the club.

A musical evening followed, in which Mr. G. K. Jones, Mr. Billing, Mr. Horace East, Mr. Pilling and others took part. The dinner was arranged by the riding officer, Mr. Holt.

It has been thought desirable to wind up the Southern Motor House Club, Ltd., voluntarily, as the Southern Motor Club desire to take over the club house and garage for its members. The proper steps have therefore been taken to wind up under the Industrial and Provident Societies Act, 1893, Section 58a, and at an extraordinary general meeting, duly convened and held at 5, Bromfelde Road, Clapham, Mr. J. W. Cufley, chartered secretary, 31, Landor Road, Clapham, was appointed liquidator to carry out the voluntary winding up.

CLUB FOR BELFAST.

A MEETING of motor-car owners was held in the Grand Central Hotel, Belfast, on the 3rd inst., "for the purpose of taking steps to oppose the proposed speed limit of ten miles an hour within the city boundary at the forthcoming Local Government Board inquiry, and also to consider the desirability of forming a motor-car club in order to promote and protect the interests of motor-car owners in Ulster." Mr. Vincent Craig, C.E., presided, and there was a large attendance. The chairman detailed the steps which had led to the application to the Local Government Board, and showed very clearly from the experience of English towns that the proposed restriction would be really ineffectual in averting accidents, of which only two in which motor-cars were concerned had occurred in Belfast.

Mr. J. N. McCammond, as one of the first to own a motor-car in the city, considered they should give serious opposition to the proposed speed limit, and Mr. T. Somerset proposed the appointment of a committee to oppose the proposal of the Corporation. This was seconded by Mr. Frank Workman. On being put to the meeting it was carried unanimously, and the following gentlemen were appointed:—Major T. V. P. McCammond, J.P.; Dr. Dempsey, Surgeon Kirk; Messrs. C. W. Henderson, Lloyd Campbell, F. Workman, J. Milne Barbour, Vincent Craig, Robert Workman, R. M. Chambers, W. J. M'Millen, A. Basil Wilson, R. E. Workman, C. Craig, W. H. Alexander, and J. S. Garrett (convener).

Mr. J. Milne Barbour moved:—"That this large meeting of motorists and others interested in motoring in the city of Belfast records its protest against the proposal to introduce a speed limit for motor-cars of ten miles per hour within the city boundary: that we regard such legislation as absolutely unnecessary, and as certain to defeat the very object intended to be served; while we further strongly condemn the proposal as retrograde, and calculated to place Belfast entirely out of line with all other cities in the control of motor-traffic; that we call upon the Corporation to withdraw its application for the sanction of this restriction, and, failing this, we ask the Local Government Board to refuse its sanction on every ground of public interest and safety." This was seconded by Mr. J. Tate, and carried unanimously.

A vote was then taken with regard to the formation of a club, for which forty-eight voted, there being only one dissident. It was agreed that the committee already constituted should make the necessary inquiries regarding rules and procedure adopted by other clubs as soon as they had fulfilled their duties in connection with the forthcoming Local Government Board inquiry.

On the motion of Mr. T. Ireland, seconded by Mr. W. J. M'Millen, a cordial vote of thanks was passed to the chairman, and the proceedings terminated.

EARL DE LA WARR has become president of the Crystal Palace A.C. The Lincolnshire A.C. has decided to terminate its agreement with the Royal A.C., as from January 31st, 1908.

A LOCAL centre of the Society of Motor Manufacturers and Traders is about to be formed for Norfolk and Suffolk.

MOTOR UNION road signs have been supplied to the Eastbourne Rural Council and the Lancashire County Surveyor for erection at the hill at Alfriston and at a village near Preston, respectively.

MR. H. LANE, of the Beeches, Anchorage Road, Sutton Coldfield, is taking steps to form an automobile association in Sutton Coldfield. A meeting will be held to-day (Saturday), at the Royal Hotel, with Mr. F. H. Finney in the chair.

THE SCOUT'S JUSTIFICATION.

A DECISION of considerable importance was given at Newmarket Petty Sessions, on Tuesday, when William Butler, a motor-scout, was charged with obstructing the police in the execution of their duty. Sir Charles Mathews, instructed by the solicitors to the Automobile Association, defended, and Mr. Bell held a watching brief for the Highways Protection League.

P.S. Mobbs stated that on December 16th, with constables Woods, Porter, and Bennett, he was on duty upon Bury road, Newmarket, controlling the motor traffic, and was at the end farthest from the town of a measured furlong when a car approached at about twenty-five miles an hour. He started his stopwatch and signalled to Bennett at the other end of the furlong. Just as the car got into the measured distance defendant, who was on the opposite side of the road, and wore an armlet, held out his arm. The car did not stop, and defendant got into the road and displayed a red badge. The driver at once put on the brake and proceeded very slowly. He afterwards saw defendant, who, when told he would be charged with obstruction, replied, "I have to do as I am told." At witness's request Butler produced the badge, and he saw the red side meant "drive steadier," and the white side "all clear." In the morning there was a motor trap near the cemetery. Defendant then stood at one end of the measured distance and stopped almost every car travelling faster than ten miles an hour, the speed-limit in force.

In cross-examination witness said he and Bennett were in plain clothes and the other constables in uniform. They tried to conceal themselves from approaching motorists. Corroborative evidence was given by Constables Woods and Bennett, and Harry Thompson, telegraph linesman.

Sir Charles Mathews quoted the case of Constable versus Little, and submitted that there was no illegality in preventing the commission of an offence by supplementing the warnings given by the speed limit posts. He contended that the specific instructions to and actions of the defendant were calculated to bring about the result the police aimed at, viz., the prevention of a breach of the law. No physical interference or obstruction on the part of defendant were suggested, and counsel contended that he had no case to answer.

The Chairman said the justices were not satisfied that there was sufficient evidence of wilful obstruction, and dismissed the case.

ROAD REPORTS.

KENT.—Road repairs, though always going on in the county of Kent unless prevented by stress of weather, never inconvenience motorists passing through the county. The practice of Mr. H. P. Maybury, the County Surveyor, is to lay the metal in half widths of the road, never leaving loose stones to be run through at nights. The County Council is spending considerable sums of money on road improvement, bridge widening, &c., and considerable headway is being made. We understand that for next season's work, commencing in April, 70,000 tons of hard stones, granite, &c., have been purchased as well as 21,000 tons of local material, to build up and strengthen the foundations before the granite is laid.

LINCOLN.—During the next few days the Saxilby, Yarborough, and Wragby roads leading into the city of Lincoln will be under repair, and doubtless Mr. R. A. Macbrair, the city surveyor, will follow his customary practice of having the stone rolled as soon as possible after being laid down.

INVERNESS-SHIRE.—The question of damage done to roads in the Highlands by motor-cars, and the probable cost of making roads suitable for the traffic, has formed the subject of discussion by the Inverness-shire Road Board. It is calculated that a sum of £150,000 would be required for Inverness-shire, including Skye, and it has been agreed to arrange for a joint representation by Highland counties to the Chancellor of the Exchequer for assistance.

WINCHESTER.—Among the roads under repair in this district are the following:—Winchester and Whitechurch road, between the city boundary and Three Maids Hill; Winchester and Basingstoke road, at Stratton Park; Upham and Bishop's Waltham road, between Fisher's Pond and Stroudwood.

LINDFIELD.—To abate the dust nuisance arising from motor traffic the Lindfield Parish Council recently had their roads tar-sprayed. A large quantity of dead fish have been found in the lake at the entrance to the village, and a theory is held locally, that their destruction is due to the tar washed off the roads entering the water.

AUTOMOBILE ACCIDENTS.

THE Countess of Orford had a narrow escape while motoring at Calthorpe, Norfolk, on Thursday week. The chauffeur, in attempting to avoid a collision with a horse and cart, turned sharply, and the left front wheel of the car struck a gatepost with such force that it was smashed, and the post knocked out of position. Lady Orford sustained some scratches and cuts from broken glass, and a doctor who was summoned attended to her injuries.

ONE afternoon last week Lady Gwendolin Cecil drove out alone from the vicarage at Hatfield in her electric car. Reaching a gate which leads to the private dairy, about a third of a mile from Hatfield House, she alighted in order to open the gate. She was on the point of re-entering the car when the vehicle started and knocked her down, two wheels passing over her. An employee on the estate came almost immediately upon the scene, and realised that Lady Gwendolen was seriously hurt. No time was lost in communicating with the household, and a carriage was despatched in haste to the scene of the accident. Later it was discovered that two ribs were broken, but happily no complications are likely to ensue.

AN inquest was held at Wimborne on Saturday on the body of a man named Adams, who, while crossing the road at a corner, was knocked down by a motor-car belonging to the Rev. Cyril Kindersley, vicar of Colehill. Adams died from shock, the doctor's opinion being that his advanced age and the coldness of the weather were factors which contributed largely to producing a fatal result. A verdict of

One of the Delivery Vans employed by the Bradford Corporation.

"Accidental death" was returned, and the chauffeur was exonerated from blame.

ON Saturday afternoon a London General Omnibus Company's motor-bus was passing through Walham Green when something went wrong with the steering-gear, with the result that the vehicle was immediately out of control, and collided with a cab standing at the rank.

THE chauffeur, Crawford Davis, against whom the jury returned a verdict of "Manslaughter," as recorded last week, has been remanded on bail at the Westminster Police Court.

AT Kensington on Tuesday Mr. Luxmore Drew held an inquest on the body of William Allen, age 84, of West Kensington, who was knocked down by a motor-bus in Cheapside on September 7th, and died last week from exhaustion set up by a fractured thigh. From the evidence given it appeared that the deceased stepped in front of the bus from behind a van, and although he was knocked down the wheels of the bus did not go over him. A verdict of "Accidental death" was returned.

AT an inquest at Croydon on Tuesday on Lilian Wright, 13, it was stated that she alighted from a tramcar, walked round the back of the car, and was knocked down by a motor-car and killed. Witnesses declared that the motor-car driver was not to blame, and the jury exonerated him, returning a verdict of "Accidental death."

POLICE TRAPS.

THERE is a trap in the village of Panb, near Oswestry, Salop.

THE Portsmouth road, Thames Ditton, has again been the scene of police activity against motorists.

THE trap in the London Road, Morden, is in constant operation.

MOTORISTS running through Grantham should exercise care. The police are very watchful.

FORTHCOMING EVENTS.

JANUARY, 1908.

- 11th (S.).—Annual meeting of the Lincolnshire M.C.C.
 15th (W.).—Conference of Automobile Club representatives, convened by the Motor Union, at St. Ermin's Hotel, Westminster, S.W.
 17th (F.).—Annual Dinner of the Nottinghamshire A.C. at the Victoria Station Hotel, Nottingham.
 Meeting in Belfast to consider the formation of a local automobile club.
 18th-Feb. 2nd.—Automobile Exhibition at Turin.
 20th (M.).—Manchester A.C. annual meeting.
 21st (Tu.).—Annual meeting of the Yorkshire A.C., Hotel Metropole, Leeds.
 22nd (W.).—Annual meeting of the Southend M.C.
 The Incorporated Institution of Automobile Engineers will meet at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., at 8 p.m. The following papers will be read:—"Front Driving, with special reference to Electric and Hydraulic Transmission," by Dr. H. S. Hele-Shaw, LL.D., F.R.S.; "The Front Driving of Steam and Petrol Vehicles," by Mr. R. W. Harvey Bailey, A.K.C.; and "A resumé of Front Drive Patents," by Mr. J. S. Critchley.
 24th (F.).—Annual dinner of the Scottish A.C. at Edinburgh.
 24th (F.)-Feb. 1st.—Scottish Motor Exhibition in the Waverley Market, Edinburgh, to be opened by Lord Kingsburgh.
 26th (Sun.).—Criterium de Voiturettes and Coupe de l'Exposition Trial for motor-cycles organised by the Turin A.C. and the Motor Club of Italy.
 27th (M.).—Annual general meeting of the Motor Cycling Club at 8 p.m., at the Tudor Hotel, London, W.
 29th (W.).—First lesson of the course to be given by Mr. R. S. Currie to the Ladies' A.C.
 30th (Th.).—Annual dinner of the Yorkshire A.C.
 31st (F.).—Annual meeting of the Blackheath A.C.

FEBRUARY.

- 1st (Sat.).—Annual meeting of the Lincolnshire A.C.
 2nd (Sun.).—Reliability Trial of the Motor Union of Western India.
 7th-15th.—Manchester Motor Show at Belle Vue.
 12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 15th (Sat.).—Auto-Cycle Union Annual Dinner.
 20th (Th.).—Meeting of the Essex M.C.
 Mr. H. R. de Salis on the Inland Waterways of England and Wales from the motor-boating point of view.
 24th (M.).—Motor Show at Bcmby.
 27th (Th.).—Mr. Mervyn O'Gorman at the R.A.C. on "Gear Transmission."

MARCH.

- 18th (W.).—Annual Dinner of the A.A. at the Hotel Cecil, London.
 21st (S.).—28th (S.).—Cordingley's Thirteenth International Motor-Car Exhibition at the Royal Agricultural Hall, London.

APRIL.

- Auto-Cycle Union's Tourist Trophy Race and Quarterly Trial.
 18th.—First meeting of the Brooklands A.R.C. for 1908. The full programme for the season appeared last week.

MAY.

- 10th (Sun.).—Targa Florio Race.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

- Royal A.C. Reliability Trial for Touring Cars.
 15th-19th.—Scottish Reliability Trial.

LIGHTING-UP TIMES—LONDON.

Jan.	12th—5.12	..	14th—5.15	..	16th—5.18	..	18th—5.22
"	13th—5.14	..	15th—5.17	..	17th—5.21	..	19th—5.24

THE TAXICAB IN LONDON.

THE new regulations approved by the Home Secretary concerning cabs and stage carriages retain the clause as to the minimum shilling fare for horse-drawn cabs within the radius, with the qualification that the driver may, if he so desires, notify, by means to be approved by the Commissioner, that he is willing to accept sixpence for any journey not exceeding one mile, without, however, indicating what the particular method of notification to the "fare" is to be. For horse-drawn cabs fitted with a taximeter, as with motor-cabs, the difference of fare within and without the radius is abolished. On all journeys the minimum fare is to be sixpence for one mile, or time not exceeding twelve minutes, and

the same for every subsequent mile, and 3d. for half-mile or under. Motor-cab fares are 8d. for each mile, with 2d. for each fractional quarter-mile.

BUSINESS NEWS.

A DRAWING and designing class has been opened in connection with the Motor Schools, Ltd., of Heddon Street, London, W.

ON Monday last the British Petroleum Co., Ltd., reduced the price of both "Shell" and their "760" by one halfpenny per gallon.

MESSRS. JAMES GIBBON AND SON, 98, West Nile Street, Glasgow, have secured the agency for Belsize cars in that city.

MESSRS. SELLS, the advertising agents, of 167 and 168, Fleet Street, London, E.C., send a clear and readable calendar for the new year.

MR. C. H. RUSH, 199, Piccadilly, W., has been appointed West End agent for the National Motor Academy of Boundary Road, Notting Hill, London, W.

A FURTHER proof of the popularity of the Stepney spare wheel has been provided at the Dublin Show, where over 100 cars are shown fitted with this attachment.

THE Ariel-Simplex racing car entered for the 1908 Grand Prix is being fitted with the Ajax detachable rims made by the Midland Rubber Company, Ltd., Ryland Street, Birmingham.

MR. R. G. ASH, head of the firm of Carr Bros. and Ash, Ltd., merchants, London, who are largely interested in the motor-car trade in South Africa, has left for the Cape on a brief business trip.

WE learn that Mr. R. V. Asbury has joined the Deasy Motor Car Manufacturing Company, Ltd., as travelling representative, to push the sale of Deasy cars with agents in the Midlands, the North of England, and Scotland, &c.

IN order to assist private owners as well as trading firms in disposing of second-hand cars the Cie des Magneto Simms-Bosch, Ltd., 23, Store Street, W.C., can fit such vehicles with the Simms-Bosch magneto ignition—an addition that is likely to assist their sale.

THE well-known motorist, Mr. Andrew Fletcher, of Pencoatland, has now driven his 60-h.p. De Dietrich about 3,000 miles, and writes that "she is marvellous at picking up speed; in fact, she is a revelation to me in every way."

WE are informed that Mr. H. Ramoisy is no longer connected with the Germain Car Company in England. Captain Theo Masui is now in a position to devote more time personally to this country, and early in the spring intends making an extended tour through Great Britain to introduce the new 28-h.p. Germain car to motorists in general.

MESSRS. C. GRAHAM-WHITE AND COMPANY, 1, Albemarle Street, Piccadilly, London, W., have secured the exclusive agency for the United Kingdom of Great Britain and Ireland, its Colonies and Dependencies, for the cars manufactured by the Deutsche Motoren-Fabrik and Herr Feoder Siegel, of Schönebeck, Germany, and for the former they have also secured the manufacturing rights.

THE annual dinner of the employees of Messrs. Mann, Egerton and Co., Ltd., was held at Norwich on Saturday last, when some 120 (out of a total roll of about 160), were entertained under the presidency of Mr. G. N. C. Mann (managing director), supported by Messrs. H. W. Egerton, F. A. Jackson, and A. C. Shepherd (directors), Mr. F. W. Doggett (works manager), Capt. A. W. M. Atthill (Secretary), Mr. J. H. Pennefather (Lower-toft manager), Mr. G. Redgment (Ipswich manager), Mr. H. G. St. John and others.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, JANUARY 18, 1908.

[No. 463.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

ON Tuesday a L.G.B. inquiry was held at Kingston respecting the application of the Surrey County Council for a regulation to be made limiting the pace of motor-cars at Bridge Road, East Molesey, from Hampton Court Bridge to the junction of the Walton road at Barnes Terrace, and at Church Road, Barnes, to a speed of ten miles an hour. Mr. C. Cornish, in stating the case for the County Council, said that without prejudice the County Council had intimated their willingness to withdraw that part of their application with respect to Barnes Terrace, on the understanding that the Royal Automobile Club and Motor Union withdrew their opposition to the remainder of the roads. Thereupon Mr. Rees Jeffreys, on behalf of the two bodies named, agreed to the course suggested. They thought that the two roads were thoroughfares to which Section 9 of the Act was meant to apply. One good reason for it in the Bridge Road, Molesey, was the number of concealed dangers not apparent to motorists using the road for the first time. They also felt that that portion of the Bridge Road near Hampton Court Bridge was used in the summer months more as a promenade than as a highway by the visitors. As regarded High Street and Church Road, Barnes, it was an old country road which had now developed into a main motor-bus route. The inspector (Mr. F. J. Willis) said that, in view of what Mr. Rees Jeffreys had said, it would be unnecessary for him to call any evidence, and after several of the Barnes residents had emphasised to the Inspector that their objection was more particularly to motor-omnibuses and not motor-cars, the inspector left to view the roads in question; but before doing so said that motors also included motor-omnibuses.

The Nolsy Country.

ON Monday, in the course of an inquiry on behalf of the Charity Commissioners with reference to the removal of the Ironmongers' Almshouses from Shoreditch, something was heard as to the relative noiselessness of town and country. According to Dr. Robinson, the Town Clerk of Shoreditch, rural life is now distracted by an uproarious pandemonium that seems to make the country fit only for deaf people. He complained that at one o'clock in the morning he was often awakened by the "old wheezing croaking motor-car belonging to His Majesty's Post Office." Later the cornercrake began his rasping note; then the nightingale became monotonous for a couple of hours; following which the cows, dogs, and birds annoyed him till getting-up time, when motor-cars commenced their travelling, and the dust nuisance added to the inflictions of the residents. Dr. Robinson is grateful that we have a Police Commissioner in London to exercise some kind of control over motor-buses, and apparently is grateful that the old ladies who enjoy the generous care of the Ironmongers' Company in the Kingsland Road, Shoreditch, have a reposeful oasis where their jaded spirits can rest from the noise and turmoil which seem incidental, if not essential, to this mechanical age. Shoreditch as a haven for the weary is quite a new conception of the district;

probably the Town Clerk will next be issuing a new handbook to the borough under the auspices of the Health Resorts Association.

The Advocate of Resilient Wheels.

THERE was a personal as well as a practical interest in last week's meeting at the Royal A.C. Dr. H. S. Hele-Shaw was in the chair. Mr. Marshall Hall, K.C., a keen motorist as well as an eminent lawyer, proposed a vote of thanks to the reader of the paper on Resilient Wheels, and this was seconded by Mr. A. W. Pinero, the dramatist. Mr. G. Stuart Ogilvie, who is advocating resilient wheels as a contributory factor in the economy of motoring is distinguished in walks of life other than mechanical. He is an Oxford man and a barrister, as well as a J.P. for Surrey, of which county he is a native. Beyond that he has written several dramatic works, has been a motorist for several years, and has, like so many other good sportsmen, found the delights of the mechanical details of the car particularly engrossing. He has not been content to take things, i.e., cars, as he found them, but is endeavouring to improve them—as is clear from his paper outlined on another page.

Continental Touring Made Easy.

THIS year the facilities for continental touring by British motorists are being considerably extended, whilst the difficulties often attendant on various Customs are being steadily eliminated by the enterprise of the various organisations associated with the motor world. Those who are members of the Royal A.C. are, of course, familiar with the triptique system developed by that organisation. Similar facilities have now been made available by the Automobile Association for the benefit of its members. All necessary deposits in connection with cars going from England direct into France, Germany, Holland, Belgium, or Switzerland, or from one of these countries into another, can now be made at the offices of the Association in London, the members being reimbursed at the return of the car to this country. On another page we give some particulars showing how this will work in connection with the Folkestone-Boulogne route, the way to the English coast from London being, of course, guarded by the system of the protection of motorists on the road inaugurated by the Association.

Inquisitorial Methods.

AMONG the matters of great moment with which the Croft Rural District Council concerns itself is the question of the speed of motor-cars journeying on the Great North Road, which runs through its sphere of influence. It recently officially complained to the Clerk of the Peace for the North Riding of Yorkshire, and he has promised that the matter shall be considered at the next meeting of the Standing Joint Committee. But that is not all. At its last meeting its own clerk reported that he had received a visit from Superintendent Wilson, of Richmond, who said that for a long time his officers had been watching Stapleton Bank. He wanted to know if there was any particular person or car of which they complained. Mr. Leach, the clerk in question, went on to say that the super-

intendent spoke of the futility of making general allegations, instead of bringing forward specific instances. Apparently, the police superintendent went further than seeing the clerk, for Mr. Murrrough Wilson observed that he thought "he interviewed most of the members of the Council." We do not remember to have heard of a similar instance of police officiousness. It savours more of Surrey than of Yorkshire, and we must protest against such inquisitorial proceedings. For a Council to complain of the speed at which automobiles traverse its streets is one thing; for a police superintendent to try and ascertain the name of some individual in the manner alleged is another.

The Irish Trials.

INDICATIONS are apparent that the organisers of the Irish automobile trials are profiting by experience, and the decision to announce the results of those to be held between May 11th and 16th within a week from the conclusion of the event is certainly a wise one. The 1908 contest will be on familiar "reliability" lines, the object also being to keep the sporting side of motoring before club members and the public, to demonstrate the general usefulness and reliability of the

A Run Through the Snow.

self-propelled vehicle, and to assist the buying public in Ireland. There will be three hill climbs and a speed test on the level. Marks will be awarded for (a) reliability, (b) hill climbs, (c) speed tests. Having regard to the uniformly good results in the petrol consumption tests during the trials last year, the committee have decided not to take petrol consumption as a part of the forthcoming trials. No account will be taken of tyre stops. Sections will be "open" and "limited," and the awards will be the 200 guinea Dunlop Cup "open," 100 guinea Dunlop Cup "limited," gold and silver medals in each class under conditions, and certificates of performance.

Anticipating the Budget.

In the columns of the *Sheffield Daily Telegraph*—one of those provincial journals which has always shown a due respect for the automobile—we notice a reminder of Mr. Asquith's threatened increase of taxation on motor-cars. On the occasion of the last Budget his attitude towards the necessary motor-car was somewhat bellicose, and, although he expressly declined to do any harm to the industry on that occasion, he

darkly hinted at the possibilities of the future. The fact that hostages have been promised to large sections of people in the way of expensive innovations in legislation seems to suggest that the time is near at hand when the various motoring organisations should cease their jangling and wrangling with one another in order to combat a common enemy. The Chancellor of the Exchequer is a mighty power with his party, and a "stone-waller" when various departments are hurling their claims at him; but should he seek to jeopardise the demand for automobiles by adding to the cost of running the same, he would scarcely be able to stand against the combined assault of the R.A.C., M.U., A.A., the provincial clubs, to say nothing of the R.I.A. and the C.V.U.A.—apologies to any other society not enumerated in this alphabetical formula.

Educating the Chancellor.

ALREADY motor-cars have to supply to the Inland Revenue sums considerably beyond anything that is contributed by ordinary vehicles; they also pay their quota to the registration authorities, and the annual licence for their drivers is not obtained for nothing. Now, to increase the impost would undoubtedly prove a restraining influence on business. Already the notion is abroad that the upkeep of the car—mechanical and tyres—is extremely heavy as compared with the original cost, and many people are doubtless holding back from becoming actual motorists in consequence of this impression. Figures of the actual costs of running vehicles are therefore educative and useful, since they doubtless do much to alleviate the feeling. But, when this has to be contended with, the present scarcely seems an opportune time to impose further charges on individual cars, and so add to the collective cost of the industry. M.P.'s who sit behind Mr. Asquith, and who, like Mr. C. D. Rose, are cognisant of the real position of affairs, will render good service not only to their *confreres* of the steering wheel, but also to British industry, by urging him to stay his hand against the motor-car in his forthcoming Budget proposals.

From Prohibition to Restriction.

A CURIOUS position has arisen in Argyllshire, where two years ago the Secretary for Scotland, after exhaustive inquiry, prohibited motor-cars to run on a number of roads, more particularly in the district of Ardnamurchan. This was done at the request of the County Council, which has now decided to petition the authorities to withdraw the prohibition from five of the roads, aggregating a length of thirty miles, and to substitute a ten mile limit. Probably the advisers of the Council have found from experience that motorists are a profitable race, and that the prohibition of cars over such a large area has had a detrimental effect upon the financial prosperity of the locality. The position is an interesting one, this being the first occasion on which a Council, having secured a restriction with regard to motor vehicles, has subsequently sought to modify its effect. It illustrates the educational process that is going on throughout these isles.

An American View.

MR. ALFRED REEVES, after seeing the London and Paris motor shows and making a perambulation of as much of the Continental trade as he could in a seven weeks' trip, has returned to the United States with a cold *douche* for those manufacturers there who thought that there was a shortage of motor-cars in the Old World. On the contrary, he says "many of the European makers are looking longingly towards America. The foreign makers are capable of supplying cars far in excess of the European demand, and are out in most instances looking for export outlets with more eagerness than are the American makers." There is not much consolation in such a statement for the manufacturers who had looked to this country to take any amount of new importations—a statement,

however, which does not apply to those cars from the States which are at the present time making a reputation here. One comment by Mr. Reeves is of particular interest, for, according to his view, the "London show was more interesting than the Paris exhibition in its display of engineering advance and refinement. Many of the English makers are evincing a daring and originality that is quite refreshing"—testimony to the position that Britain is gaining, if it has not already attained, in the automobile world.

Motoring in New Zealand.

MOTORING is going well forward in both islands of the colony of New Zealand, and public services in which motor-vehicles are employed are becoming popular and profitable. Recently a new tariff on automobiles was established. Whereas the customs duty on motor-cars has hitherto been very heavy—being on the basis of 30 per cent. *ad valorem* on those of foreign manufacture, or 20 per cent. *ad valorem* on cars of British manufacture—it has now been altered, and the

which gives a total of £224,862, as against only £222,114 in the corresponding month of 1906. For the whole twelve months of the past year the figures are:—Number of cars imported, 4,819; value of same, £2,080,166; imports of motor parts, £2,472,520; total, £4,552,686. For 1906 they were:—5,776 cars of a value of £2,486,337; parts, £1,885,323; total, £4,371,660. Turning now to the exports of British cars and parts, these have during the past year undergone a very satisfactory expansion. The number of complete cars shipped was 2,322, of a value of £860,353; chassis and parts were responsible for £467,325, the gross total for 1907 of £1,327,678 comparing with £820,020 in 1906, and £502,714 in 1905.

Certificated Drivers.

THE system of granting certificates for those qualified to drive motor-cars, and who also possess a simple knowledge of the law and sufficient common sense, inaugurated by the Royal Automobile Club, is being widely followed in the colonies. In the Transvaal a Mines Regulations Commission

Mr. Best, of Messrs. Inglis Brothers, Wellington, New Zealand, at the wheel of the 10-h.p. Star Car on which he won the hill-climbing championship recently held near that town.

duty on the basis of 20 per cent. *ad valorem* is charged on the bodywork only. The chassis, including wheels, is now admitted free of duty, whether fitted with a body or not, and no distinction is made between foreign or British manufacture. Evidently there are many firms in the colony capable of building bodies, but the production of the machinery of the vehicle is as yet insignificant there. Such a concession should be regarded with favour by that section of the British motor engineering industry which is seeking an outlet beyond our shores.

Motor-car Imports and Exports.

THERE was a marked decline last month in the importation of foreign motor-cars and parts into this country, as compared with November, but the total was still slightly in advance of that recorded in the last month of 1906. The number of complete vehicles which reached the United Kingdom during December was 204, their value being given at £78,698. Parts were responsible for an additional £146,794,

has reported that drivers of motor vehicles owned by mining companies should have passed some examination held by the Government mining engineer, the nature and scope of the test being left with him and the Transvaal Automobile Club to determine. At Durban, we believe, the examination for the driver's certificate is conducted by the Natal Automobile Club on behalf of the Durban Corporation; and elsewhere in the colonies the automobile clubs are acting with local authorities in doing much to secure that competent drivers shall be certificated in order to satisfy the standard of public safety.

CALLING on Messrs. Pack and Sons at their Sussex Coach Works, George Street, Brighton, the other day, we found considerable activity in the body building department, and noticed several artistic bodies for well-known chassis in the course of construction. The firm are also doing well with the automatic lever for raising and supporting bodies which was recently described in our columns.

MOTORING TOURS IN THE PARIS DISTRICT.

(Concluded from page 1000.)

STRAIGHT on from Rambouillet the route nationale leads to Maintenon and Chartres, but, circling Paris, one takes the second class road to Etampes, *via* Ablis, in all forty-three kilometers. It is a second-class road, but does not look it, and, being a byroad, one can let his car out, for there is little or no traffic to stop one, and the gendarmes hereabouts are lenient. Etampes dates from the year 604, and accordingly has a respectable old age to its credit and a history quite as worthy. Various councils of the church were held here when the church practically ruled the state, and the Roi Robert of the second race of kings built a palace here known as the Palais de Quatre Tours, and François Premier, by making the celebrated Anne de Pisseleu the Duchesse d'Etampes, did much more for its popular fame. Etampes has left to-day the Tour Guinette, a part of the chateau which existed before the twelfth century, with the churches of St. Giles and St. Martin dating from the same period, but with later Renaissance interpolations, and another church, that of Saint Basil, which owes its foundation to King Robert in the tenth century. Etampes really, take it all in all, is worth seeing, and the Hotel du Grand Monarque is not bad either; nine francs a day, not more, all found, and the proprietor has been heedful of some recent advice given by the paternal Touring Club de France, with a desirable result with respect to matters sanitary in his grandiloquently-named establishment. From Etampes to Malesherbes is a run of twenty-six kilometres through the heart of the Gâtinais, a forest grown and sylvan region. It is the most thickly wooded of any of the *petits pays* of France bordering upon the Île de France, a land of pleasant valleys and rolling hills, and all green or gold, according to the season of the year. The chief product of the Gâtinais, and in great repute in the markets of Paris, is honey. Malesherbes has a thirteenth century church and a chateau which contains some good furniture of the days of the Louis, and some Gobelin tapestries. There is also the Chateau de Rouville in the suburbs. The town is worth an hour or two, and then the road runs direct—this time a "route nationale" again—straight through the heart of the Forêt de Fontainebleau, the grandest, perhaps, and certainly the most celebrated, forest in the annals of history and art.

Fontainebleau's attractions are many and for all men, and to none more than to automobilists, for the uncounted kilometres of well-kept forest roadway have a great charm and novelty. Strike right through the forest and enter the ville by the Grande Rue, past the palace gates, and put up at the Candran Bleu for *dejeuner*. As a sight Fontainebleau's palace, the outgrowth of Louis VII. *rendezvous de chasse* of the twelfth century, is quite worth the greater part of the afternoon, when there will still be daylight enough left to make the "Grande Ronde" in the forest, including a detour to take in that little artists' village of other days—Barbizon. Have your *aperitif* here at the "Charmettes"—or tea if you affect that sort of thing—look through the closed gates into the gardens of the houses once occupied by Corot, Millet, Diaz and Bayrè, buy souvenir picture post cards to your fill, and then take the road again across the forest, twenty kilometres south-east, to Moret-sur-Loing. This is an ancient little town, with two fortifying gateways at either end of its main street, situated just over the further end of the forest. It is an

artists' sketching ground as famous to-day as was Barbizon in the past. "Les Violettes"—not a hotel, a pension or a boarding house—will care for you marvellously for six francs a day, and you will think you never met with anything quite so good for the price nor anything quite so dainty and picturesque as Moret itself, with its gates and towers, its donjon, its church and its flour mills built out over the river in real stage carpenter's fashion. It is astonishing how unreal the real thing can be sometimes! Truly Moret is a paradise for artists!

The next morning, following up the road by the Seine, just over the ridge back of Moret, you will have a delightful fifty kilometres to Provins, *via* Bray. Provins is one of the most appealingly historic small towns of France (once its population was 60,000, tenth century; to-day it is 8,000). It has a round half-dozen architectural monuments which rank supreme in their respective classes, from the famous Tour de César and the city walls to the Renaissance Eglise Ste. Croix. The hotel Boul d'Or at Provins is bound to keep one for lunch; time will pass quickly in this old mediæval town; and you might do worse. From Provins to Chateau-Thierry, in the valley of the Marne, is sixty odd kilometres, *via* la Ferté-Gaucher, with nothing much to detain one en route except the wonderfully diversified landscape through which one passes. This is the Pays de Brie, and is as famous for its cheeses as is the Gâtinais for its honey. It is a fact that

the only *reel* Brie cheese comes from hereabouts; all others are rank imitations and decidedly not so good in taste or quality. At Chateau-Thierry one is in the valley of the Marne, a highly industrious, work-a-day river like the Seine, but if possible more picturesque. Certainly there are no poplar-lined river banks quite so charming as those of the Marne. It would be an ideal river on which to journey in a motor-boat, and you could even reach the Rhine by the canal which joins the two rivers in their upper reaches. Chateau-Thierry has a first-class literary shrine in the birthplace of Lafontaine; a historic one in the ruins of its mediæval chateau, and a sporting one in the site of the annual hill-climb.

A Pretty Corner at Mantes.

So much for Chateau-Thierry, and if the afternoon is still young you can easily roll off another forty kilometres to Meaux, by the valley road along the Marne, and still arrive further on for the night's stopping place. Meaux is worth a good hour; the city of Bishops has a grand old cathedral, a charming and dainty ruined chapter house, an old Episcopal palace, a battery of curious old water mills astraddle the river, and the remains of a chateau built by the Counts of Champagne in the thirteenth century. Such a menu should satisfy the sight-seeing palate of the most exacting tourist. Villers-Cotterets is forty kilometres northwest of Meaux. It can be reached direct from Chateau-Thierry in about the same distance if it is desirable to omit Meaux. It is the birthplace of Alexandre Dumas Père and the site of an old royal chateau of the Valois, around which still hangs a certain sentimental glamour, in spite of the fact that it has fallen from its high estate and become an almshouse. The Hotel du Dauphin is decidedly the best stopping place for the night in these parts. It is entirely fitted with the famous and deservingly well-thought-of "*chambres hygiéniques*" promulgated, if not invented, by the Touring Club de France, and has got accommodation for thirty cars under cover. The house in which Dumas Père was born is pointed out with pride by every resident of the place, and it sits full on the main street. Here, and in the neighbouring town of Crepy-en-Valois, Dumas spent the early years of his life, before he went up to Paris to become the greatest romancer of his age.

The Forest of Villers-Cotterets is one of the historic forests of France. It was first set out by Francois Premier, and beneath its shade have dawdled a whole portrait gallery of historic and gallant figures, the art loving Francois, his friend Anne de Pisseleu, whom he made the Duchess d'Etampes, his discarded friend, the ageing Diane de Poitiers, who came back again later with the youthful Henri II. in her train, and finally there were Henri Quatre and his whilom friend, the fair Gabrielle d'Estrées, who had more than one clandestine meeting here. The forest is not what it once was, Napoleon III. having cut it largely down and into firewood, which he sold for a profit to himself. From Compiègne to Chantilly is perhaps forty kilometres, following for the most part the valley of the Oise, another of the picture rivers of France, but again a most industrious one. The Chateau de Chantilly shares the honours with the palace at Fontainebleau in abounding interest for the visitor. Each of them is far and away ahead of Versailles or St. Germain, though thousands visit the two latter to hundreds the former. Chantilly, at any rate, needs a guide book to itself, its attractions cannot be catalogued here. Put up at the Hotel du Grand Condé, which sounds romantic, is good and expensive, and very sporty—for the horse racing at Chantilly is, for many, the chief reason for going there at all. However, let the horse-racing go by the board, if you can—and devote yourself to the two Renaissance chateaux, the Ecuries of the Condés and the great collection in the Musée given to the State by the Duc d'Aumale. All this will take half a day—with lunch—but get on to l'Isle-Adam, or Auvers, for the night. At Auvers, at the Hostellerie du Nord, you will come across something unique in the hotel line, very simple, very Bohemian—as that term is understood of the people—for the house caters mostly for artist folk, and Parisians at that, and withal the price for everything is very modest. You may dine in the garden courtyard, under a sort of a tent, at a long table, with chickens and pigeons and cats and dogs strolling about and looking for tit-bits, and perhaps even a stray pet lamb, if the beast has not grown into a sheep by this time. If this is a little too much *en famille* and you would have more seclusion you may dine in the panelled *salle a manger* with its walls covered with pictures and *croquis* by painters from Daubigny down to various Montmartre eccentrics.

At last we have swung around the circle, in three days or five, according as to whether we have lingered by the way or made the *vitesse*, as the French chauffeur says, between towns. If one is bound south of Paris, down into the chateaux country—Touraine—it is easy to make one's way *via* Pontoise, St. Germain, Rambouillet and Chartres. If England is the objective, another enjoyable three or four days can be put in covering that historic highway from Paris to Boulogne or Calais. Usually the motor tourist rushes this in a day or less, but this is wrong, for the district is rich in interest. In outline the itinerary works out something like this: Beauvais (Hotel de France et d'Angleterre), with the most stupendous late Gothic cathedral standing above ground; Amiens (Hotel de Rhin), whose cathedral has been called the Bible of architecture; Abbeville (Hotel de France), where at any rate you should stop long enough to view the Eglise St. Wulfran. After this run along easily to Montreuil-sur-Mer, fifty kilometres, and put in the night at the Hotel de France, which bears a date of the sixteenth century over its *porte cochere*. The hotel is a rambling, creaking old structure whose only signs of modernity are in its *salle a manger* and in the electric light wires stretched along its three-century-old beams.

AN American Company has recently delivered to the Protective Department of the City of Boston, U.S.A., a motor salvage wagon fitted with a 40-h.p. four-cylinder air-cooled engine. The body has accommodation for four men and provides space for the full equipment usually carried on apparatus of this kind, which includes two short ladders, two chemical extinguishers, a life saving net, door openers, axes, plaster-hooks, &c. Each tool or other part of the equipment has its own place upon the car, special brackets or sockets being provided for each.

LAMPS FOR 1908.

AMONG the matters of importance which the motorist must consider in connection with his car the question of lighting occupies a leading place in his thoughts. Not only does safety depend upon the forward illumination but legal pains and penalties may follow any failure in the rear. As every owner knows, lamps constitute either a source of worry or of content, the latter quality being generally associated with economy. Certainly this is the case with the Polkey projectors and side and tail lamps made at the Hockey Lamp Works, Birmingham, by Messrs. George Polkey, Ltd. The firm have both experience and reputation, and their productions for the coming season have distinctive features which should attract the attention of all seeking a combination of good appearance and workmanship with reasonable cost and effective lighting. The projector (Fig. 1) is of the torpedo shape, with a projecting hood and a lens of 7½ in. diameter, the overall measurement from back to front being 10½ in. This is adaptable for either electric or acetylene lighting; in the latter

FIG. 1.

FIG. 2.

The Polkey Lamps.

case the special point of the burner consists in the two impinging arms being parallel with the reflector, with the result that, from the front, the flame appears end on, with consequent reduction of the glare to persons approaching near the lamp. Below the fine jets of the acetylene burner are cleaning needles, which clear away the carbon on the twisting of a couple of milled-edge nuts. Particular care has been given the parabolic reflector, so that the rays of light are accurately reflected.

In addition to the projector, we also illustrate (Fig. 2) one of the side and rear lamps. The set of three are of the same size and shape, and are similarly attached to the car. In the case of the tail lamp, instead of a red sight glass being provided, the whole of one of the sides is occupied by a red glass, thus conforming to legal requirements. All the lamps are thoroughly well constructed of brass, with reflectors of a specially good type. These latter are white sterling silver rolled upon copper, thus securing a permanence of reflecting merits. It will be seen that British makers of lamps have fully recognised the strength of the demand for accessories of native manufacture, and the way in which Messrs. Polkey, Ltd., have responded to the call is worthy of the spirit of enterprise that still characterises many of the older firms who have attained distinction in other industrial spheres. The lamps illustrated may be seen at the London offices of the makers, Finsbury Pavement House, Finsbury Pavement, E.C.

WEST HAM is seeking to attract manufacturers and engineering firms, and the low rates for electric power are proving helpful in this direction. Recently established concerns in the borough are the Rip Motor Company, of Leytonstone Road, Stratford, the British Alcohol Company, Ltd., motor spirit manufacturers, Wharf Street, Canning Town, and Dustabatus, Ltd., patent road material manufacturers, Hartman Road, Silvertown.

ANDOVER AND WINCHESTER.

SOME of the most delightful memories of the pioneer motorists are associated with the early trials and tribulations which were organised by the R.A.C. in the old days when it was the A.C.G.B.I. It had not aspired to become a near neighbour of Marlborough House, although, even then, it was growing great in Whitehall Court. Those pioneer tests of cars were mostly confined to the placid highways of the south, and level stretches were better enjoyed than the merry switchbacks that seemed to have been planted on Scottish hills and Derbyshire moors for the alternating sense of victory and doubt in the minds of motorists of the nineteenth century.

Of course, every car can take hills and romp over mountains in this more modern era. Radiating from the Crystal Palace, the daily runs to different venues were delightful anticipations, and often successful realisations. They were not all tame performances. Sometimes judges would rush from concealed hedgerows for brake tests, and often policemen would come from hiding places for names and addresses. There was one never-to-be-forgotten day of trapping—on the return from Winchester, when car after car was stopped, and such official records of furious driving were told that even motorists began to realise they had speedy vehicles at command.

But we must desist this reminiscential mood into which we have fallen on reading an account of how a fellow-journalist journeyed to Stonehenge from London on Pratt's motor spirit—and a 16-20-h.p. Argyll car, a successor of the car upon which we journeyed with the late Mr. A. Govan on the memorable journey already referred to. This capital description has been reprinted by the Anglo-American Oil Co., who have added some neat illustrations, the excellence of which can be seen from those we are enabled to reproduce by their permission. The route to Stonehenge, as suggested by Mr. H. Massac Buist, is as follows:—

From Hyde Park Corner to Hammersmith, Shepherd's Bush, and Brentford to Hounslow, where take left for Staines, crossing bridge there, and turning right for "Basingstoke, 29 miles." Through Egham, past Virginia Water (20½ miles from London), Sunningdale, Bagshot (leaving Bisley on left hand, presently Aldershot on left), York Town (passing Sandhurst and Wellington Colleges on right), Hartley Row, and Hook to Basingstoke. From Basingstoke by Worting, Oakley, and Whitechurch to Andover, where take right fork for Amesbury (left fork is for Salisbury), striking north-westward through Weyhill, thence south-

westward to Amesbury, and so in 1½ mile keeping straight on across Salisbury Plain to Stonehenge (79½ miles). Return to Amesbury, where make rectangular turn due southwards for Salisbury.

This is a run of eighty-nine miles. From thence it is a good journey *via* Romsey (31½ miles) to Winchester (40 miles), or the latter city can be reached in 16 miles from Basingstoke (46½ miles from London) by way of Popham and Kings Worthy. All these places deserve a visit. They have each their special interests as well as being in Hampshire, which, according to the late Grant Allen, was "the real original nucleus of the British Empire."

Winchester, historically, was certainly one of the first if it is not now the greatest of our cities. In the Roman days five important roads branched out from the place, leading to Porchester, Southampton, Old Sarum, Marlborough, and Silchester. There are many historical corners apart from the abounding interest of the cathedral. The High Street, shown in the sketch, leads to the fine statue of King Alfred, and has a grand old town hall with a projecting clock of curious workmanship. The lower storey of the building is recessed, and has a colonnade. A few steps beyond is the Buttery Cross, at the

foot of which a butter market was formerly held—in the days before the motor-car revival. In the days of King Alfred, Winchester was, to quote Dean Kitchen, "the home of all the learning and the arts known in that day, and rivalled the earlier splendour of the court of Charles the Great at Aix-la-Chapelle." Later, trade and commerce were attracted to the city, and the Guild Halls of the merchants were a great feature of its life.

When Southampton was an important port—important relatively as regards London—Winchester's commerce rivalled that of the present capital. In Stuart times it attracted royal notice, and Sir Christopher Wren was instructed to advise with regard to the design of a bold scheme to give a noble approach to the cathedral, but the demise of Charles the Second led to the abandonment of that idea.

Andover, another town selected for pictorial representation, is of a very different order to the ancient city of Winchester—although it, too, has its old almshouses, historic grammar school, and other points of architectural importance. It was a Roman station, possesses a charter dating from the reign of King John, and has a good wide market-place, well becoming in a town of agricultural prosperity. A few years ago it became notorious by reason of the severity of the fines inflicted by the local bench upon unsuspecting motorists who were trapped in the vicinity. "Hand-over justice" became a very significant phrase among sportsmen.

Hampshire is a capital county for motoring, its well-constructed roads—broad and straight in many parts—being a pleasure to all who travel by the newer locomotion. Police traps occasionally abound; but, it must be acknowledged, a better spirit has lately come over the police there, and complaint is no longer loud on that point.

"WHO'S WHO" has a niche entirely its own in the reference library, and grows more representative every year. Its accuracy has long been at high-water mark, as they observe in motor-boating circles.

THE imports of motor-cars and cycles and parts into New Zealand during 1906 attained a value of £79,821. The British share of the total was £55,010, that of the United States £10,289, Germany £1,942, and other foreign countries, £12,580.

A YOUTH who applied a lighted match to the plug hole of an empty petrol cask in the yard of a motor garage at Jedburgh, recently, was killed outright. The cask was hurled into the air, striking the lad, and producing a fracture of the skull.

The Stanley Steam Car.

SINCE we described the Stanley steam car in the *M.C.J.* of August 20th and 27th, 1904, the vehicle has steadily increased in favour, both in America, where it is built, and in this country. While the general arrangement is still the same, many improvements in the details have been introduced, and the complete description which follows will no doubt prove of general interest. Three sizes are being made, that known as the E.X. and rated at 10-15-h.p. being fitted with a two-cylinder engine 3 in. bore by 4 in. stroke and an 18 in. boiler; the F. model is of 20-30-h.p., the engine cylinder dimensions being 3½ in. by 5 in. and the boiler diameter 23 in.; the third car is of still higher power, and is the latest introduction; it is rated at 30-40-h.p., being equipped with a 26 in. boiler and an engine having cylinders 4½ in. bore by 6½ in. stroke, this being the same size as that fitted in the racing car which created world's records over the kilometre and mile on the Florida Beach in January, 1906. The general arrangement of the different types being the same, the following details may be taken as applying to all, regard being had, of course, to the fact that the dimensions of the various parts vary in accordance with the power of the car.

The engine (Fig. 1) is placed in a horizontal position underneath the rear of the car and in such a position that a spurwheel on its crank shaft meshes with a bronze toothed wheel containing the differential on the back axle. It is of the two-cylinder double-acting type, employing ordinary slide valves and Stephenson link motion. All the bearings on the engine are of the ball type, including the crank shaft bearings, crank pins, eccentric rods, straps and the guides on the crossheads. The forward portion of the engine is hung from the car by a hanger strap, whilst the other end is carried on the back axle by means of engine frame hangers and circular bronze straps encircling the back axle

Fig. 1.—Sectional View of Engine and Transmission to Rear Axle.

on either side of the differential case; these straps are free to move, to maintain the proper relation between the engine gear wheel and driven gear on the axle. One of the chief objects of this arrangement is to allow the engine and the drive on the back axle to be in correct relationship when the springs of the car are in action. The whole of the engine and differential gear is enclosed in dust and mud proof copper cases, provided with suitable sliding doors for inspection and lubrication.

The boiler (Fig. 2) is of the vertical fire tube type, tested under steam and hydraulic pressure up to from 700 to 800 lbs. The shell and bottom plate are swaged out of one piece of special steel; the top tube and plate are let in, and to make a joint an electrically welded steel ring of great strength is shrunk on round the outside of the shell. The latter is then wound with several layers of steel wire under tension to give additional strength. The end plates are drilled taper to take half-inch tubes which are expanded, these forming stays. The inside of the boiler, in fact, all the parts in contact with the water, is heavily galvanised to prevent corrosion. Both a safety valve and automatic fire cut-out are provided, the latter cutting out the burners at any fixed steam pressure. A special fusible plug is also fitted, which protects the boiler from damage in the event of a low water level arising through careless driving or other cause. This warns the driver when there is still 3 in. of water

in the boiler; the fires have then to be turned out and a new plug inserted, the whole operation being accomplished in a short time on the roadside, without it being necessary to take down the burner or other parts.

Fig. 2.—View of Bottom of Boiler, showing Superheater and Fusible Plug Connection.

The main burner (Fig. 3) consists of a round plate of cast iron having raised parallel corrugations which cross the burner plate. Transverse slots which are cut in these raised portions about ¼ in. apart form the outlets for the mixed gas and air. The pilot light is fixed by a small compartment about 3 in. long by 1 in. broad placed between two of the above raised sections, but entirely independent from them. The fuel is led to the burners first through a coil of heavy drawn brass pipe placed in the flue at the top of the boiler; it then passes to the three vaporisers, which consist of steel pipes crossing the raised sections of the burner, and emerging in three nozzles to the mixing tubes. The two outside nozzles constitute the main fire and the centre one the pilot; the supply to the latter is entirely independent, the object being for it to light up the main fires as they are turned up or down by the automatic fire cut-out or by the hand control. It is possible

Fig. 3.—View of Burner, showing Raised Slotted Sections and Final Vaporising Tubes.

to burn paraffin in the Stanley burner with certain alterations, or by using a specially-constructed burner, but this is not recommended, except where the car is to be used in counties where

difficulty is experienced in procuring the light spirit or where its high cost precludes its use.

The water passes from the water tank through a gauze strainer to the power pumps (see Fig. 4) thence either to the boiler, past the boiler check valve, or by the return pipe back to the water tank. The feed to the boiler is regulated by a by-pass valve which is placed under the steering wheel beneath the

Fig. 4.—Diagram of Water Connections.

throttle quadrant. When the by-pass valve is closed the water cannot go through the return pipe, and the pumps force it past the check valve to the boiler. When the by-pass valve is opened, the water flows through the pipes against which there is no pressure, viz., the return pipe, and the boiler check valve prevents the steam pressure in the boiler from bearing on the pumps. An auxiliary hand pump is provided in connection with the hand lever, which also actuates the petrol hand pump. When using the hand pump, the valve connected with the same should be opened, care being taken to shut this off after use, for if it be left open the power pumps will force out the plunger of the hand pump.

The steam control system is shown diagrammatically in Fig. 6. Steam passes from the top of the boiler in the centre through the main throttle, past the auxiliary throttle and through the boiler to the superheaters, which are subject to the full heat of the fire. The steam is then passed again through the boiler and into the main steam pipe, where it takes lubricating oil for the

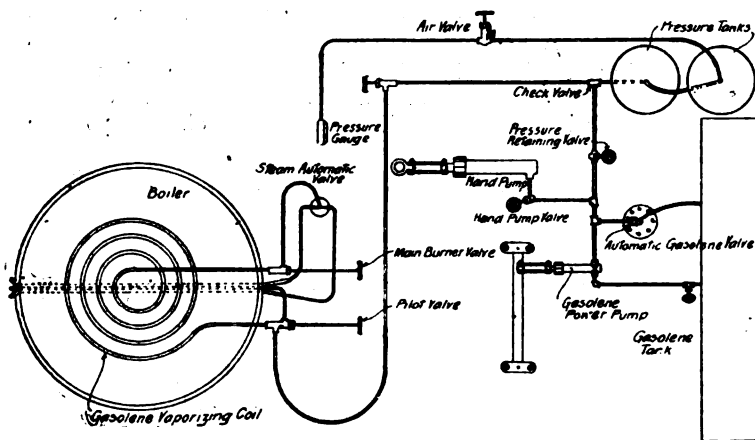

Fig. 5.—Diagram of Fuel Supply and Control System.

cylinders. The lubrication of the latter is effected by means of a small pump in connection with the lubricating oil tank, worked by means of a ratchet wheel off the pump rocker shaft. As the ratchet wheel turns, the small pump plunger is drawn out, by means of a dog and cam, sucking oil from the tank. At a given point the plunger of the pump sends a jet of oil to the steam, which is carried through the main steam pipe to the engine. The faster the car travels the more oil is supplied to the cylinders,

and vice versa. The oil tank has a capacity sufficient for from 250 to 300 miles.

The arrangement of the fuel supply system is illustrated in Fig. 5. The petrol, referred to as gasoline in the illustration, is carried in a non-pressure tank at the rear of the car. The fuel is gravity fed through a pipe from the tank to the petrol power pump, situated under the footboard and working off the same shaft as the water power pumps. It is then forced into the pressure tank, referred to below, by means of the petrol power pump. From the pressure tank it is led through a coil of solid drawn brass pipe on the top of the boiler; this heats up the petrol to such an extent that it is only necessary for it to travel through short steel pipes, across the fires to the main burner nozzles. Between the coil and the main burner vapourising tubes the petrol is intercepted by the hand main burner valve situated on the dashboard and the automatic valve, this latter cutting off the fuel supply at a fixed steam pressure.

The pressure in the pressure tank is indicated on the dash by means of a gauge, which registers up to 200 lb.; the usual working pressure which can, however, be adjusted, is about 100 to 120 lb. A petrol automatic relief valve is connected up to the pump, so that, should the pressure exceed that at which it is set the excess of petrol is led back to the main tank.

The pressure tank really comprises two cylinders arranged side by side, the bottom of one being connected with the top of the other. Supposing the tanks to be empty, and the gauge at zero, to get up petrol pressure in order to start the fire the operation is as follows:—With the hand pump, pump petrol till the gauge

Fig. 6.—Diagram of Steam Pipe Connections and Lubricating System.

registers between ten and fifteen lbs. Tank No. 2 is now nearly full of petrol, the air having been driven into tank No. 1, and, being compressed, is under a pressure, indicated by the gauge. A hand pump is now attached to the valve and air pumped into tank No 1 until the gauge indicates from eighty to ninety pounds.

If the fire were now lighted, and allowed to burn for some time, the petrol pressure would gradually drop. But it can be raised by using the hand petrol pump again.

When running on the road, the power pump supplies the petrol and keeps up the pressure; as this pump delivers an excess, an automatic relief valve is provided, adjustable as to pressure, through which the excess passes back to the supply tank.

(To be concluded.)

MESSRS. SIDNEY STRAKER AND SQUIRE, LTD., have an extensive repair shop and garage at Nelson Square, Blackfriars Road, S.E., where they are prepared to undertake the overhaul and repair of motor-cars of every class. Their machine shop is equipped with modern machine tools, and a staff of thoroughly experienced mechanics is employed.

ON Monday a motor-car driver was sentenced at Westminster Police Court to a month's hard labour for being drunk while in charge of his vehicle, and on the same day a Hammer-smith chauffeur was sent to prison for fourteen days without the option of a fine for having been in a similar condition while in charge of a motor-car in the Charing Cross Road, London, W.C.

CONTINENTAL NOTES.

The A.C.F. Grand Prix Race.

The regulations regarding the 1908 Grand Prix Race have now been adopted and issued by the French Automobile Club. The race is to be over a distance of from 700 to 800 kilometres, and held in the first fortnight in July, the date and circuit to be fixed later. Each firm will have the right of entering three cars, but manufacturers employing engines, or the same construction mechanically, under licence, or under a title which includes the same name, will not be allowed to enter more than three cars together. The entry fees are fixed at the following figures:—£200 for one car; £360 for two cars; £480 for three cars. Entries are to be sent to the Sporting Commission of the A.C.F. before February 15th. After this date and until June 1st entries will be received at double fees. In the case of a large entry list, arrangements may be made for an elimination contest. All motors taking part in the race are to be of a bore of 155 mm. in the case of four cylinders, or the equivalent in the case of one, two, three, six or eight cylinder cars. The competing cars must be of a minimum weight, in running order, of 1,100 kilog. The employment of oxygen, &c., in con-

sions for two or four-cylinder motors, and the weight not to exceed 650 kilos. The distance of the race will probably be about 350 kilos. All the French builders of small cars who have been questioned on the matter are enthusiastic about the projected race, they considering that it will tend to stimulate the construction of cheaper and lighter vehicles.

Motor Wagon Regulations in Antwerp.

As a result of some trials, extending over a month, recently made by Messrs. De Roubaix-Oedenkoven with a Renard road train in the Antwerp district, the municipal authorities of that city have just adopted the following new regulations with regard to motor lorry traffic:—(1) Motor-wagons used for the carriage of goods may not be loaded with more than 5 tons; the tyres, if made of metal, must be at least 16 cm. wide. (2) The motor-wagons must not exceed a speed of 6½ miles per hour. (3) Motor-wagons for the carriage of goods must be able to travel in both directions; they must be driven by a machinist-stoker and a helper. (4) The vehicles (trailers) must be attached to the motor by means of an articulated hook, which cannot come unfastened, and which is made in such a manner that all the vehicles follow exactly the same direction; no more than two vehicles

A French Military Motor Ambulance.

In France dogs are now being used in connection with ambulance work. The illustration given above shows some trials being made with them in conjunction with a motor ambulance recently constructed by Messrs. De Dietrich and Co.

nection with the carburettor is forbidden. All vehicles must have a reverse motion and be fitted with silencers having an horizontal outlet. The colours fixed for the various nations are as follow:—Germany, white; America, white and red; England, green; Belgium, yellow; France, blue; Italy, red; Switzerland, yellow and red. All repairs are to be made by the driver or *mecanicien*; detachable rims may be used, but the changing of wheels is prohibited. It will be permitted for the *mecanicien* to change place with the driver at the end of any lap, but only on the circuit in case of urgent necessity.

Le Grand Prix des Voiturettes.

The surprise of the past week in French motoring circles has been the decision of the A.C.F. to organise a voiturette race to be known as Le Grand Prix des Voiturettes. It is to be held over the same course as that of the Grand Prix for big cars, probably the day previous to the last-named event. The conditions will probably limit the diameter of the cylinders to 100 mm. for single-cylinder engines, with proportionate dimen-

may be drawn, and each train must be not more than 82 ft. long. The load of each vehicle is not to exceed the weight determined in Art. 1; The last vehicle must be equipped for going backwards. (5) The approach of the motor-wagon must be signalled preferably by means of a horn, but in no case by a shrill or piercing whistle. (6) Any infringement of the regulation in question to be punishable by a police fine.

A Successful Aeroplane Flight.

After many attempts Mr. Henry Farman, on Monday last, succeeded in accomplishing a flight with his aeroplane over a measured circular course of one kilometre, thereby fulfilling the conditions attached to the Deutsch-Archdeacon prize of £2,000, the trip being made in the presence of the committee. The aeroplane was kept at an altitude of from twelve to twenty feet, and made a wide sweep round the distance post without sensibly slackening speed, Mr. Farman finally alighting beyond the winning post with the same ease and precision with which he had started. The machine is fitted with an eight-cylinder 50-h.p.

Antoinette motor, and the official time for the measured kilometre was 1 min. 28 sec.

Public Services in Italy.

The Italian Minister of Posts and Telegraphs has appointed a technical commission for the purpose of drawing up a programme for a public competition of motor vehicles for the conveyance of passengers, mails, and parcels. The Minister has stated that such vehicles might become valuable auxiliaries to the railways, and that it is consequently a matter of necessity to devise a type of special automobile adapted for the postal and passenger services.

A Small Car Trial in the South of France.

The Marseilles Automobile Club is organising a speed trial of small cars for the 19th May next. The event, which is known as *Le Circuit Provençal des Petites Voitures*, is open for: (1) Cars with single-cylinder engines up to 100 mm. bore, (2) ditto to 125 mm., (3) four-cylinder vehicles up to 80 mm. bore, and (4) ditto up to 95 mm. The entry list is being limited to fifty competitors.

One of the Single-Deck Motor-Buses in Service between Havre and Quilleboeuf.

The Nice Automobile Week.

The programme of the automobile week at Nice, which is to be held in March, has now been definitely drawn up. On the 22nd there will be a kilometre speed trial; on the 23rd a "Raid du Printemps" will be held in place of the touring competition first proposed; on the 25th an elegance competition; on the 29th a flower fete; and on the 31st an automobile paperchase.

Petrol in Switzerland.

A new regulation requiring petrol tins to bear an official stamp as to their capacity was to have come into force in Switzerland on the 1st inst., but, owing to the movement organised by the importers, it has been decided to postpone the order for a year. In the meantime, the Government authorities will consult with the dealers as to the best form of petrol tin to adopt.

More Motor Cabs for Paris.

A new company is in course of formation in Paris, with a capital of £80,000, to place 200 De Dion 8-9-h.p. single-cylinder taximeter motor-cabs in service in the French capital, at the same rates as the horse-drawn vehicles. The daily receipts per cab are estimated at 35 fr. 5 centimes, of which 35 per cent.

(12 fr. 27 c.) will be the driver's share, leaving 22 fr. 78 c. for the owners. With a hundred cabs in service the working cost, including depreciation, has been figured out at 14 fr. 7 c. per cab, and with 200 vehicles at work 13 fr. 53 c.

The Liedekerke Cup.

The annual race for the Liedekerke cup, which is to be held at the end of July next on the Ardennes circuit, will this year not be run on a cylinder capacity basis, but will be restricted to cars having engines with a maximum bore of 106 mm. for four-cylinder motors, and a minimum weight empty of 1,050 kilogs. The distance to be covered will be at least 300 miles.

Racing on the Ice.

The Swedish Automobile Club, whose headquarters are in Stockholm, is organising a reliability trial of motor vehicles for the 15th and 16th February, and a speed trial on the ice for the 8th March.

A German Voiturette Trial.

It is reported that the German Imperial Automobile Club, in conjunction with the German Motor Cyclists' Association, proposes to organise a trial of voiturettes in July next. There will be three daily runs, viz., Berlin-Breslau, Breslau-Prague, and Prague-Munich. Both the Bavarian and the Austrian Motor Clubs have been officially invited to participate in the organisation, as the latter half of the course passes through Austrian and Bavarian territory.

A New Anti-Freezing Medium.

Writing to "Omnia," a French motorist recommends the use of chloride of magnesium as an anti-freezing medium. Added to the cooling water in the proportion of from 12 per cent. to 15 per cent., he claims that not only does it possess advantage over glycerine, in that the water always remains perfectly fluid, but that it has no detrimental action on metal.

Motor Vans in the German Postal Service.

Following the example of Munich, motor mail vans are now to be introduced in the postal service in Nuremberg. It is stated that thirteen vehicles are being ordered, of which nine will be continually in use and four held in reserve, in case of temporary breakdown of any of the others.

French Motor-Car Imports and Exports.

The imports of foreign motor-cars and parts into France during the eleven months ending with November last attained a value of £305,480, a decrease of £1,080 over the corresponding eleven months of 1906. During the same periods the exports of motor-cars and parts from France advanced from £5,058,040 to £5,366,040.

Motor Vehicles for Municipal Purposes.

The municipal authorities of Bourges (France) propose to replace the present horse-drawn dust-carts with motor vehicles.

Miscellaneous Items.

The municipal authorities of Berne, Switzerland, propose to add an electrical motor vehicle to the equipment of the local fire brigade.—The Furka road between Brig and Morell, in the Swiss Canton of Valais, has been closed to automobile traffic.—His Imperial Highness the Crown Prince of Germany has just ordered a Stepney spare wheel for one of his cars.—The two women motor-cab drivers in Berlin are reported to have given up the work, the reasons assigned being the cold weather and the ribaldry of the Berlin roughs.—A public motor-car service between Madrid and Getafa, a popular resort about eight miles from the Spanish capital, is contemplated.—The annual 500 metres hill-climbing contest, organised by the "Provence Sportive" of Marseilles, is to be held on April 19th next.—An exhibition of agricultural motors is to be held at Bourges, France, at the end of September or at the beginning of October next.

AT 69, Roscoe Street, Liverpool, Mr. Henry J. O'Connell has commenced business as a motor agent and dealer in accessories.

MR. ELI CLARK has a large motor garage opposite to his showrooms at 223, Cheltenham Road, Bristol, and is well able to prove of assistance to motorists in that district.

AMONGST the latest purchasers of Argyll cars in India are the Nawab Shah Yar Jung Bahadur and His Highness the Maharaja Dalgan-Jansing of the Patna State.

MR. H. L. STOCKS, of Kirkcaldy, has recently ordered a Sheffield-Simplex 45-h.p. six-cylinder limousine as a result of his satisfactory experience with the Brotherhood car he acquired about two years ago.

MR. A. SWINGLER, J.P., of Smalley Hall, Derby, informs us that the 30-h.p. Daimler referred to in our last issue is for his own private use, and is not being supplied to him by his firm for business purposes.

THE Bombay, Baroda and Central Indian Railway Company has lately put in service a number of covered trucks specially designed for the conveyance of motor-cars. They are 25 ft. long inside, so that two small cars can be carried in one truck.

WISLEY, always a popular resort with Surrey motorists in summer, was even more so last week-end, when skating was in full swing on the lake. Cars arrived in never-ending succession until round the Hut Hotel was assembled one of the largest concourses of automobiles on record.

AN interesting pamphlet has been published at Beeston and Coventry giving the opinions of many owners of Humber motor-cars as to the excellent qualities of those automobiles. A county arrangement has been devised to facilitate reference by prospective owners who may wish to test the popularity of this car in their own districts.

SOME of the resident magistrates of Ireland are calling public attention to the new Lights on Vehicles Act, 1907, which is in operation in that country as well as in the southerly part of Great Britain. At Bray and elsewhere the magistrates have asked the constabulary authorities to see that its provisions are generally observed.

"THE INDUSTRIAL MOTOR REVIEW," published on the 15th inst., contains several articles of practical value to all interested in the development of the commercial motor. Its comparative costs of horse and motor traction are an authoritative and reliable feature, and the experiences of users of motor delivery vans have distinct value.

DESPITE the many warnings given in the *M.C.J.*, as well as in our contemporaries, as to the care that is necessary to prevent the freezing of the cooling water and resulting damage to the motor, the recent snap of cold weather has brought in quite a large amount of work in the way of cracked cylinders to the various firms which make a speciality of repairing castings.

SOME of the motor taxi-cab drivers in London are of an ingenious turn of mind; one of them has devised a box arrangement over the clutch and brake pedals, so that when driving his feet are protected from the cold. Another has fitted a specially shaped iron bracket to the dash, over which he can in wet weather place the lower portion of his overcoat, and in this way keep the rain from dripping into his boots.

"PETROLIUS," in the "Morning Advertiser," quotes the interesting case at the Daresbury Petty Sessions, recently reported in the columns of the *M.C.J.*, as "very pleasant reading for motorists, for we do not often hear of motorists obtaining costs against the police; and yet, where the police are unable to establish their case, it seems only reasonable that costs should be given against them. Motorists are not infrequently brought from long distances to answer charges which the police are unable to sustain, and there is no reason why they should be denied their costs when they are the victims of such proceedings. The Daresbury case will no doubt be a useful lesson to the local police, and will not be lost on the motor trappists generally."

HERE AND THERE.

MESSRS. COOPER'S Coach Builders' Art Journal Diary for 1908 will be of considerable service to coach and motor body builders.

SEVERAL dealers in Edinburgh have been fined for keeping calcium carbide in tin vessels without having a licence for the same from the local authority.

ON all motor-cars employing the exhaust to create pressure in the petrol tank for the purpose of leading the petrol to the carburettor there is a certain amount of condensation from this exhaust which gets into the petrol tank. While in the Napier car this mixture is, of course, prevented from getting into the petrol tank by an exhaust pressure filter; Mr S. F. Edge has recently had some trials made with the view of ascertaining what quantity of liquid is, under normal running conditions, created in this way. A 40-h.p. six-cylinder car was run a distance of forty-two miles, petrol used $2\frac{1}{2}$ gallons, and the result was there was 1.4 cubic centimetres of water collected in the filter for every gallon of spirit consumed. This works out for every 100 gallons of spirit

4.93 oz. (very nearly $\frac{1}{4}$ pint) of water, which is a very material amount to get into the pressure tank, and likely to cause plenty of inconvenience. The way this possibility is eliminated in the Napier cars is shown by the accompanying illustration. A is the main body of the filter itself; B the fine gauze which prevents dirt or other harmful matter getting through to the pressure valve; C is the perforated plate which supports the gauze, and so prevents it being blown through by any violent explosion; D is the top of the filter, held on by four little screws, so as to make it easily removable to clean the gauze if necessary. At the bottom of the filter is a small tap by which any accumulation of water can be allowed to run off. E shows the pressure filter in place on the engine, while F is the pressure valve itself. Mr. Edge informs us that the general principle of this exhaust filter was suggested by Mr. Edward Kennard, of The Barn, Market Harborough, the purchaser of the first car turned out from the Napier works.

THE White Hart Hotel, at Windsor, has a Daimler motor-car, which it is letting out on hire.

To prevent the water in acetylene generators from freezing, a French motorist recommends the addition of ordinary methylated spirits to the extent of about 25 per cent.

MESSRS. A. J. WILSON AND CO., LTD., 154, Clerkenwell Road, E.C., issue a serviceable office calendar.

THE London motor-'bus strike came to an end on Tuesday morning, when most of the drivers capitulated.

A MEETING of carmen in London has passed a resolution thanking metropolitan borough councils for sanding the roads during the recent inclement weather.

THE Automobile Association patrols, as well as the police, are engaged in the effort to discover the driver of the car which caused the death of a labourer at Kenley on Saturday night.

THE question of the records made at Brooklands has been discussed by the R.A.C., who agree that a scheme for world's records should be laid before the Competitions Committee at the next meeting, and that a letter should be written to the Automobile Club of France pointing out that the R.A.C. had succeeded in timing records automatically, and therefore accurately, and inviting their co-operation in the scheme for the institution of a definite system.

THE illustration below shows a 15-h.p. Thames cab, for which Messrs. W. T. Clifford-Earp, Ltd., inform us they are finding a very good market. The vehicle, accommodating four passengers inside and one outside with driver, was the first to be tested on Brooklands track on January 2nd, and it covered the half mile, electrically timed, at the rate of 34.6 miles per hour. In addition to this it showed itself a very good hill-climber by ascending the winding gradient, on leaving the Brooklands

enclosure, on second speed, in a very thorough manner. The petrol consumption is twenty-five miles per gallon, and the roof over the driver is arranged to carry 3½ cwt. of luggage. Another special feature in connection with the cab that is claimed is that the whole of the transmission gear, including the engine, can be removed from the chassis for inspection, and put in its place again, in the same time that it takes to put a horse in the shafts of an ordinary cab.

WEBSTER'S Royal Red Book has now attained the distinction of the 121st edition, and is as free from errors as previous issues have been proved to be. It is a court and fashionable register, and, having well established itself, will doubtless be of interest to those engaged in the motor trade. Messrs. A. Webster and Co., of 43, Dover Street, W., are the publishers.

APROPOS of the cost of motoring, a very interesting letter has just been published in the "British Medical Journal" from Dr. G. Baynton Forge, M.R.C.S., L.R.C.P., of West Malling, Kent, who has run his Coventry-Humber 5,548 miles, and has kept an exact record of the cost of running during this period (covering fourteen months). The following are his figures:—Petrol, £20 15s. 4d.; oil, £6 11s. 6d.; sundries, £4 8s. 10d.; ignition, £2 6s. 6d.; tyres, £14 18s. 1d.; mechanic, £10 13s. 9d.; total, £59 14s. Dr. Baynton Forge adds that "I have never been late for nor missed an appointment or train, neither have I been hung up on the road."

IN the new fire-engine station of the L.C.C. at Trinity Road, Wandsworth, the horse has been entirely ignored, the whole equipment being by motor appliances as far as possible.

MR. W. T. LORD is having a busy time in India, whither he has gone in the interests of the Argyll car. His headquarters are at the Bombay Motor Car Company's premises, where thirty of the 14-16-h.p. Argylls are to be delivered. Other agencies are also being established in the Far East.

NOT a few motorists have met with new experiences during the recent snap of cold weather. Frozen acetylene generators have not been unusual, while many have experienced great difficulty in starting up their engines, all sorts of dodges having been tried to induce the motor to run. The necessity of a hot water or exhaust gas jacket to the carburettor has also been proved by the freezing up of those not so provided. One motorist of our acquaintance had an experience of this sort late on Saturday night last, or rather early on Sunday morning, and eventually had to invoke the aid of two policemen to help him to push the car to the nearest garage, nearly a couple of miles away!

ON Tuesday afternoon a daring robbery was effected at the Hutchinson Tyre Depot, 13, Maddox Street, W. Some person or persons unknown walked into these premises and removed a Hutchinson non-skid tyre, No. 47,000, and another plain Hutchinson tyre with leather band, but unnumbered. It is presumed that the thief had watched the depot for some time, and at the moment when all the assistants were in the offices at the rear, quietly walked in unobserved and took the two tyres away. As the number of one cover is given, purchasers of tyres should be able to notify the Hutchinson Tyre Company if these tyres are offered them for sale, and inform the police, who have the matter in hand.

AS we announced last week, motor-cars played a prominent part in the celebrations in connection with the freeing of the toll bridge at Waterford. There were fifteen cars drawn up in front of the City Hall Buildings at a quarter before midnight, and after the mayor, high sheriff, and the other members of the Corporation had got on board, a procession of cars was formed, headed by Sir Wm. Goff, Bart., chairman of the Irish Automobile Club. On the stroke of midnight they proceeded across, after the mayor had duly declared the bridge free. Practically the whole of the city turned out, and the cars had rather a lively time, getting backwards and forwards across the bridge, the crowds, in their endeavours to be amongst the first to cross, c'inging on to the vehicles, the majority of which were lent by Mr. W. F. Peare. A special vote of thanks has been accorded that gentleman by the Corporation, as they considered it rather unique that a procession of motor-cars should be the first to cross the freed toll bridge. Captain J. J. O'Neill Power, J.P., Colonel R. T. Carew, J.P., D.L., and other local gentlemen also joined the procession with their cars.

WITH regard to some of the small electric vulcanisers which are being described as suitable for vulcanising covers or tubes in conjunction with any ordinary ignition accumulator, a word of warning is given by the United Motor Industries, Ltd. Supposing the vulcaniser takes about 4 amps. of current and maintains this consumption throughout the vulcanisation; this is too excessive from an ignition accumulator of anything under 40 ampere hour capacity, or even at that capacity, and it must invariably follow that if vulcanisers are used in conjunction with accumulators whose ampere hour capacity is under 40 that the plates will very quickly deteriorate, and that trouble will ensue from buckled plates, falling of paste, &c. In order to meet the demand for an accumulator suitable for vulcanising purposes the firm named have issued an accumulator of 40 ampere hour actual discharge, or it would nominally be known as a 60 ampere hour ignition accumulator. This is especially suitable for vulcanising purposes, and the plates are specially made for rapid discharge. They are of massive construction, very carefully pasted and treated to prevent any possibility of damage due to the high discharge rate they will be worked on. This battery will be known as the "Castle" vulcanising battery, and is likely to soon become a standard accessory in the lists of the U.M.I.

SOME NOTES ON RADIATORS.

By E. T. HUMPHRIES.

THERE are many parts of a motor-car, particularly those hidden from view, that can to a very large extent be designed and carried through irrespective of all appearances, which oftentimes materially assists both the working efficiency and durability. Such remarks hardly apply, however, to radiators, as there is no part of an internal-combustion self-propelled vehicle which is so much in evidence as the water cooler. This being the case, there is sometimes a tendency to sacrifice that which would be most efficient for something which adds to the general effect and outline of the vehicle.

There is every indication that the idea of the radiator was taken from the steam-engine condenser, for in general design it is a reproduction of the ordinary surface condenser, only that its operations are somewhat reversed. In the motor-car its functions are to cool the water, which is inside the pipes, and the air on the exterior, with a fan to assist its radiation, while with the steam engine the steam is inside the pipes and the water outside and used as an agent for cooling purposes.

Before treating with the various kinds of radiators, a word will not be out of place with reference to the use of the fan, particularly in view of the fact that we are just now in the winter season. It should not be overlooked that beyond the fact that at least some power (if only small) is absorbed in driving this particular part, in very cold weather and when running fast it is oftentimes quite unnecessary and undesirable to run it at all, for if the water is reduced below a certain temperature it follows that excessive cooling of the cylinders may reach such a pitch that the economical working of the engine may be affected. For this reason a combination of fly-wheel and fan is not without its drawbacks.

It can be accepted as a general rule that the gilled pattern of radiators is more easily repaired than the honeycomb; although some makers of the latter claim that, in the event of damage, a tube can be replaced by a new one in half a minute. The gilled type is all that is required for low-powered cars, but when it is considered that the efficiency of the cooling media depends upon the size of the honeycomb block or the number of feet of gilled tube, it will be understood that for high-powered cars, such as anything over 40-h.p., the former is the more efficient. Size and shape vary very much, but for cars not exceeding the above-mentioned horse-power the outside dimensions of either type should approximately be 26 in. by 22 in. by 4 in.; above that power an additional 1½ in. depth is usually adopted. Racing and special freak cars are not taken into consideration. They are a law unto themselves. There is no doubt but what the efficiency of a radiator, particularly in hot weather, would be increased if some arrangement could be fitted on the back so as to direct the air currents into the fan. As at present constructed, much of the air is out of the range of the fan leaves, and if the fan is really of any assistance the cooling surfaces are not uniform and unequal expansion and contraction takes place, quite sufficient at times to account for leaking tubes; and owing to the different metals that go to form a radiator and its tubes, this is a very important factor. Similar troubles arose in the earlier days of the locomotive engine, when copper fire-boxes and brass tubes were used.

THE "Resileon" filled tyres had completed a run of 911 miles up to Saturday last. Non-stop runs on all save one day have been accomplished.

A 100 kilometre race was held near Buenos Ayres, Argentine Republic, on the 13th inst., the winner being M. Vanhee, who on a 15-h.p. Gladiator covered the distance in 1 h. 22 min.

MESSRS. DUTTON AND AUNGER are attempting a motor-car ride across Australia from Adelaide to Port Darwin. It took them three hours to cross a creek between Oodnadatta and Charlotte Waters, arriving there on Sunday, December 8th. They have difficulty in arranging for supplies of petrol, and have already been delayed in consequence.

SOME USEFUL NOTES.

THE separation of the parts of an engine or car that may have become tightly stuck together because of dirt and corrosion during a long period of use is often a serious problem. In such a case, nothing promises better than recourse to a fairly liberal application of paraffin, supplemented by light but continued tapping with a hammer. By directing the taps judiciously, first in one direction and then in the opposite, now to one portion of the surface and then to another, and giving them as much force as is safe, long persistence will almost invariably result in the desired separation. Fresh applications of paraffin should be made from time to time, if necessary, to insure a supply constantly in place, ready to help by its property of penetrating to the finest crevices. For bolts and nuts, shafts, hubs and collars, pins and keys, &c., this method is widely recognised by expert machinists and repairers as almost a panacea.

It sometimes happens that injury to a tyre may necessitate a more or less extensive run on the rim, in which case there follow certain inevitable results that will call for some repairing. As much as a hundred miles, even if the road is very bad, will not necessitate replacement, if particular care is used to strike all projecting obstructions at a low speed. At the end of the run, no matter how carefully it has been made, it is almost certain that there will be a few dents in the edges of the rim, which will have to be straightened out before the edges of the tyre cover can be got in place. To straighten out these kinks, and to do so accurately, is a difficult matter without special facilities, but by making a tool like that illustrated herewith it is an easy matter, remarks the "Motor Age," to bring the metal back to

its original section. The end *a* of the tool, which should be made of good steel, is ground into the exact form of an uninjured rim, as shown at *b*. Therefore, by driving it with a hammer into the bent places as shown it will readily effect proper straightening. The width of the working end of the tool should not be greater than from one-half to three-quarters of an inch, or it will not work right, on account of the curve of the rim. It will require some time to do the repair properly, but it will pay, nevertheless. After the rim has been straightened out the tool should be put under the rim and the latter tapped with a hammer to smoothen out the outside edge of the rim. Then the rim should be given coats of paint and varnish before it can be considered to be repaired in a workmanlike manner.

AMONG the many causes that may result in loss of compression in a motor is the settlement of any dirt or foreign matter in the seat of either the inlet or exhaust valves, the latter being the more prone to this trouble. Bits of carbonised oil very often fall on the seat of the exhaust valve and are pounded into the metal, causing the valve and valve seat to "pit." They, of course, do not fit closely after this, and the compression is forced out between them as a consequence. In a case of this kind it is necessary to remove the valves and grind them in.

THE fact that an engine "goes off" after a month or two of use, and yet everything, such as the ignition, compression, &c., is all right, may usually be attributed to the slight alteration in timing due to the wearing either of the tappets or valves, or both. Nothing is so important for an efficient and sweet-running engine as accurate timing of all the valves, and this is a thing frequently neglected by many people.

Correspondence.

[Letters to the Editor should be addressed to the offices, 37-38, Charing Cross Road, London, W.C.]

MOTOR BODY DESIGN AND COMFORT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We shall be much obliged if you will grant us space to say a few words in reply to your correspondent "Comfort." As is now fairly well known, we have from the commencement given special attention to the comfort of the passengers; in fact, that is one of the leading points which has been in our minds ever since we started experimenting and designing our N.E.C. cars—now some five years ago. Your correspondent says that on some cars "the rear seats somewhat overhang the back axle." This is surely a rather euphemistic way of expressing the actual facts, for on very many cars the seats entirely overhang the back axle, and the passengers' feet are actually over the back axle itself. It is certainly true that a few manufacturers have managed to improve considerably on this.

Your correspondent then says that "it may be practically impossible to bring this (rear) seat sufficiently far ahead to make a substantial improvement in the comfort of these passengers." Now this is just what we have succeeded in doing. We have designed our car in such a way that we can give more accommodation than can any other maker and still have our rear seat absolutely right forward of the back axle.

A Graphic Demonstration of the Effect of the Bonnet on the Design of the Car as a whole.

But merely putting the seat just in front of the back axle will not by itself secure the utmost possible comfort. If "Comfort" will inspect almost any car of standard design he will see that the amount of play permissible to the axle and the wheels is very small indeed, and that if these parts were allowed to have any real freedom of movement they would in passing over any rough roads smash the body to atoms. To secure comfort there must be flexibility of springs, and to allow for the consequent greatly increased movement of the axle and wheels it necessarily follows there must be a very greatly increased clearance, and it is impossible to secure this clearance in any practicable manner except by getting the back axle right out behind, clear entirely of the body and the chassis.

We should be very pleased indeed to give "Comfort" a demonstration of what we mean. The sort of trial we should like would be for "Comfort" to choose the roughest piece of road he knows, drive over it on a car of standard design and then drive over it on one of our N.E.C. cars. One cannot attempt to make clear the great difference without using what would seem to be exaggerated language. Not only would there be this extraordinary difference in comfort, but also we should dare with complete safety to drive our car over a rough road at a far higher speed than anybody dare drive a vehicle of standard design. It is quite amusing when taking out a passenger accustomed only to cars of ordinary design to see them clutch the seat in dread when our car approaches at a high speed some place on the road at which they expect to get a fearful jolting. They simply go over it without feeling that there has been any road inequality.

There are other important considerations in which the argument

is all in favour of our system, such as danger in rounding corners at high speed, to which we should like to refer, and hope you may permit us to do so at a later date, but our present letter has already got to a considerable length.—Yours truly,

NEW ENGINE (MOTOR) CO., LTD.

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, "An Interested Enquirer," asks a question as to valve setting which I am sure is of interest to a great number of amateurs. I can tell him of at least one attempt to solve the problem, viz., "Larrad's Petrol Motor Timer," which I saw and purchased at the recent show. By this instrument, which any amateur can use, an engine with adjustable tappets can be quickly set with very great accuracy, provided the cams are accurate. Whether, as the makers claim, this setting is the best possible, even supposing that fast and slow running engines should be set alike, I must leave to motor engineers to determine; but I have seen a most marked improvement in one engine by its use, and a considerable one in another, in which, owing to cam irregularity, the system could only be adopted to the extent of getting the inlets and exhausts timed accurately for opening, the closing of both being irregular. I am now experimenting on a third, and have little doubt of a good result.

The ease with which the slightest want of truth in the cams can be detected is remarkable, and I am inclined to believe that an unsuspected cause of bad running in many engines is due to a failure to grind the cams true after hardening. The makers, Messrs. Pulham and Co., of Bexhill, will, I believe, make the instrument to any setting desired, if a purchaser has a pet theory of his own. I have no financial interest in the instrument, but I have received from its use not a little instruction and benefit.—Yours truly,

AMATEUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with great interest the various methods of timing in the *M.C.J.* of the 11th. The setting of the inlet valves in the 24-h.p. Panhard is extremely interesting, as I think this engine is not a high-speed one—i.e., it is not high-speed when compared with the Minerva and others. It would be interesting to know if the Panhard have tried this engine, opening the inlet valve earlier and closing it earlier. What have Messrs. S. F. Edge, Ltd., Iris and Clement-Talbot to say on the subject?—Yours truly,

INTERESTED ENQUIRER.

[We shall be glad to publish the diagrams and particulars of the valve setting of the engines of other leading motor-car builders, if they will kindly furnish us with the necessary material.—Ed. *M.C.J.*]

A CLUB GARAGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—About this time last year you allowed me, through your correspondence columns, to place before your readers a brief description of my club, the inauguration of which had just taken place. The unique feature of this club was the provision of a workshop and a modest garage. Possibly a brief account of our first year's working may now be of interest.

The object of providing a small workshop was that many motorists and motor-cyclists in the town took sufficient interest in their machines to desire to do alterations, experiments, and adjustments, and without a workshop and possibly assistance from those more skilled in the use of tools it was very difficult if not impossible.

We find that our workshop has, on the whole, been well patronized, but much more by motor-cyclists than car owners, which is but natural, as the old-fashioned type of enthusiastic car owner, who would hardly ever allow anyone but himself to make adjustments and alterations, is becoming very rare, at any rate in this part of the country.

Motor-cyclists seem much keener on this branch of the sport, which might be termed "workshop motoring," and many considerable alterations have been made in our workshop, such as the fitting of foot-rests, two-speed gears, carburettors, &c., and even repairs to coil and accumulator attempted, whilst as a rule at least one machine is adrift for overhauling.

The storage capacity of the club premises, if not perfect, is at least very useful, and allows us to extend the club's usefulness to members in the district, who are glad to have somewhere to put their machines up when passing through the town or attending club runs or competitions, and where they can get them at any time without having to submit to the early closing arrangements of some garage proprietors. Briefly, then, our experiment with a club workshop has been successful, and in towns of large population (this has but 10,000) and engineering centres such a club should prosper enormously.—Yours truly,

R. K. HUBBARD,

Hon. Secretary Basingstoke and District Motor Club.

DETACHABLE WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your report of Mr. Tryon's exciting performance at Brooklands on January 2nd, and the fine record of fifty miles in 37 min. 45.9 seconds which he established, you mention that near the end of the distance a tyre gave out, and a delay of just under two minutes took place in changing the wheel. This is of course strictly correct, that is to say from the time the car became stationary to the time it started off was about that time, but the reason for what seems to me an abnormal length of time should I think also be given.

It is the Napier practice to change the R.W. wheels in races by bodily lifting the car on to a trestle instead of using a jack, because it is rather quicker. As a matter of precaution, although only the right hand hind tyre was down, both wheels were changed, Tryon, in the knowledge that he was only just inside the record, was impatient to get off again, and as soon as the wheels were fixed, and before the car had been lifted off its trestles he put in his clutch. Now it is not easy to lift a car with its wheels whirling round, and so Tryon had to withdraw his clutch and put on his brake before the car could be touched, and this, of course, delayed matters. Eye-witnesses tell me that the wheels themselves were fixed fully one minute before the car started off again.

Most people were prepared for the essential value of detachable wheels for a twenty-four hours' record, but it must have come as a surprise to many to learn that the world's record for so short a distance as fifty miles also depended for its making on Rudge-Whitworth detachable wire wheels.—Yours truly,

JOHN PUGH.

MICA WIND SHIELDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to some remarks in your correspondence columns, mica wind shields might be used, but they are easily damaged, a terrible trouble to clean, and the stuff has a tendency to turn yellow. I have not observed the effect of rain on mica windows. It seems to me that when an accident occurs, causing the car to stop suddenly, the passengers are shot forward, I suppose, with force proportional to the speed the car was running at. Now why cannot screens and windows be so arranged that they, too, shoot forward out of the way and stay there by means of a spring catch. Then a rail across the framing of the window would, I should imagine, effectually arrest the further progress of the passengers. Anyway, a bump will be better than a cut. Of course, there is the driver, who has the wheel to stay him; the centre window would come down on his head—well, he does it himself, I suppose.—Yours truly,

HERBERT J. CHAPMAN.

THE "FOUR-INCH" RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We should like to protest through your valued columns against the proposed abolition of the above race. If this event is allowed to fall through, we think an opportunity of a good advertisement for British manufacturers would thereby be lost. There is, in our opinion, no reason whatever why the proposed Isle of Man race should clash in any way with the 2,000 miles trial, as one would be a race, pure and simple, and the other a reliability trial. A large number of the public take more interest in a sporting event than in a reliability trial, and the proposed race will provide the only opportunity for the British manufacturer to compete on his own ground with foreign rivals. We shall most certainly compete should the race be held.—Yours truly,

ARIEL MOTORS, LTD.

WIRE WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We find that there is a rumour so persistent that it points to the probability that it is being industriously circulated by opponents of wire wheels, that these ruin the tyres through permitting water to gain access to them through the holes in the rim. If there were the least shadow of truth in this the Lanchester Company would hardly continue, after six or seven years' experience, to use wire wheels, nor would the popularity of the wire wheel be steadily on the increase. The absurdity of the suggestion is obvious when it is remembered that each nipple has a head very like the valve in a motor cylinder, and the rim is drilled and countersunk in the direction that the spoke will occupy, so that the tension on the spoke draws this nipple head down on to a very excellent seating. The tension on the spokes varies according to the design and other circumstances from 600 lb. to 1,200 lb., and in many cases even higher. It will readily be seen that water or anything else stands a very poor chance of getting through.

An examination of a rim which has been used in a wire wheel points to the same conclusion. The seating of the nipple head is absolutely free from rust, while the inside of the rim is sometimes very slightly rusty, most of the rust being round the security bolt holes and the valve hole. This is partly because the security bolts and the

valves are made of different metal from the rim, thus setting up an electrolytic action. The other reason is that when tyres are fitted sufficient care is rarely taken to see that the washers form a waterproof joint with the rim.—Yours truly,

RUDGE WHITWORTH, LTD.

CARS FOR HIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a reader of your esteemed Journal, and having a powerful motor-car at my disposal, I write asking the advice of any of your readers as to a suitable resort where the same might be let on hire to the best advantage.

Some of your subscribers living in places where motor services have not yet been established may be able to suggest possible openings likely to be successful.—Yours truly,

W. M.

DRY BATTERIES FOR IGNITION PURPOSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had so much trouble lately with the accumulators—what with broken and corroded terminals, quick loss of charge, &c.—on my car (single cylinder) lately that I am anxious to find a substitute which, although the cost may be slightly greater, will permit me to go on my way without fear or worry regarding ignition difficulties. On making enquiries I find that the De Dion Company usually turn out their small cars with dry batteries in place of accumulators, and also that a firm is supplying a dry cell known as the Helløsen. I therefore venture

Dr. J. W. Smith, J.P., of Weaverham, near Northwich, and the car lately presented to him by the inhabitants of the villages of Weaverham, Acton, Kingsley, Norley, Barnton, &c., as a recognition of his forty years' service as a medical man in the district and sixteen years' service as a county councillor. The vehicle is a 14-20-h.p. Siddleley, and was supplied by Messrs. Isaac Robinson and Sons, Motor Engineers, Northwich.

[Jeffries, Northwich.

to write to ask those motorists who have experience of dry batteries to send you the result of the same. Particularly I would like to know whether they do give the satisfaction that is claimed, and also what is the mileage which can be got out of a four-cell set say by an 8-h.p. car.—Yours truly,

L. BENTLEY.

WE have an inquiry for the address of the makers of Bartlett's generator.

THE A.C.F. GRAND PRIX RACE.—Mr. S. F. Edge writes that at present no entries have been sent in for the six-cylinder Napier cars for the A.C.F. Grand Prix Race for the reason "that no entry forms or copy of regulations have yet been received either by myself or the Royal Automobile Club. As soon as these regulations are published and approved by the R.A.C. then the question of entering will at once be dealt with."

THERE was an interesting function at the Mansion House, E.C., on Wednesday, the 8th inst., when the various winners of awards at the Milan Exhibition attended to receive the usual tangible proof of their success. Among these was the secretary of the E. M. Bowden's Patents Syndicate, Ltd., that firm having annexed a gold medal for the display of Bowden wire mechanism, &c., at the exhibition in question.

THE OUNCE OF PREVENTION.*

(Concluded from page 1014.)

SUPPLIES.

Among the supplies which should be carried, a good quantity of the best high test motor oil is the most important. Grease of the proper quality for use in cups and in packing bearings, and graphite for chain lubrication, should be included in the outfit. A plentiful supply of cotton waste and a cake of tar soap should not be forgotten. Rubber friction tape is a very handy article not only for temporary electrical insulation, but for stopping leaks in rubber pipes and in tyre repairs. A supply of annealed iron wire of medium size, compactly coiled, and a little rubber-covered electric cable may prove of value, the former in making temporary mechanical repairs, and the latter in renewing a defective portion of the ignition circuit. A little emery of rather fine grade should be provided, in case valves require grinding, and a piece of emery cloth will be found useful in brightening the electrical contacts of the ignition system. Every car should be supplied with a funnel fitted with a very fine wire gauze strainer, for use when the petrol tank is to be filled. The three supplies most necessary to the running of an automobile (excluding the cooling water) are petrol, lubricating oil, and good, lively batteries. As long as these are at hand and no part of the car is actually broken, anyone worthy of the name of an automobilist ought to be able to keep on the road. It is rather a commentary on human responsibility that there are so many stops made from lack of petrol and so many "foolish virgins." Fresh batteries are not obtainable at every cross roads, and one set at least ought to be brand new when one is starting on a long tour in "truly rural" districts. In genuine touring, when long distances are made each day, inspection and lubrication, as previously outlined, should be carried out punctiliously at the beginning of each stage.

ENGINE TROUBLES.

The most common trouble likely to be experienced on the road is a failure of the engine to develop its power. This may be total or partial, and it is necessary to locate the trouble and remove it. When an engine stops or becomes weak the chances are that the cause is defective ignition rather than anything else. With a single cylinder motor explosions which are actually missed can be readily detected at low speeds by the sound and by the unsteadiness of the motion, but when at high rates of revolution it is less easy to be sure that missing is going on, while with a four-cylinder engine it is very difficult to detect the occasional missing of one cylinder, especially when the speed is at all high.

An engine may fire perfectly when tested running light, with nearly closed throttle, at a very moderate speed, but will miss very badly when the throttle is opened widely, the spark advanced, and the speed high. There are several reasons for this: When the throttle is nearly closed a very small charge of gas is taken, the compression is low, and even a weak electric tension will cause a spark at the plug through the not very dense charge, but when the throttle is opened wide and the spark advanced so as to take place at the maximum point of the now greatly increased compression, a strong electrical tension is required to force the spark through the dense gas. Again, when the engine is running slowly the contact device makes a longer electrical connection than when it is speeded up, and a weak battery is then more likely to build the current up to the sparking point than when the connection is so brief as it is at very high speed. Sometimes, too, when the surfaces of the contact-maker are worn, the contact brush, when revolving at very high speed, may pass over the contact surface without touching it sufficiently to establish a connection. One should not reason that because an engine fires properly at low speeds, on light throttle opening, it will fire its charge regularly under heavy duty. The chances are very large that the engine which suddenly fails to develop its wonted power under these conditions is either missing charges or igniting them feebly. The carburettor is very likely to be blamed for giving a bad mixture in such cases, but it is generally innocent.

When the engine is shut down after giving weak power attention should be paid to whether it stops promptly after switching off the current. If it does not, the chances are that it is hot and has been firing prematurely. Such a condition is generally preluded by "knocking" or some signs of labour. Overheating may be caused by a failure of the cooling water to circulate properly, or by lack of cylinder lubrication, and, if the engine is found unduly heated, the circulating pump should be inspected to see that it is operating properly, and the radiator examined to see that it is full. If the latter is comparatively cool while the engine is excessively hot, it is fairly certain that the circulation is defective, and the cause of its stoppage must be sought. Some of the best cars are equipped with a gauge which shows at a glance whether the pump is developing pressure, but this does not necessarily prove that the circulating system is not clogged at some point.

In case the cooling water is doing its work properly, and yet the engine overheats, investigation of its cylinder lubrication must be undertaken, and one must be satisfied that sufficient oil is actually delivered to the bearing surfaces of the pistons. Lubrication may have failed so completely that the pistons stick when the engine is stopped. In this case cylinder oil should be injected freely until the engine is

"limbered up" sufficiently to operate upon its regular oil supply which has been restored. If the engine is found to stop promptly upon the switching off of the current it is not a case of overheating. It is a good plan to turn the engine over and note carefully whether the compression in each cylinder is of the usual strength, and whether the inlet and exhaust valves of the respective cylinders open properly at the correct times. If compression is lacking in any cylinder it may be that its exhaust or inlet valve is stuck open or that the inlet valve is stuck closed. A valve or its spring may have broken or some foreign object may have lodged on the seat of the valve. Everything appearing right in this quarter, and the engine still unable to develop its full power, the ignition is almost certainly at fault. Those cars which make use of the auxiliary spark gap, with a separate break for each cylinder, and carry the arrangement mounted upon the dash in plain view of the operator, are at an advantage over others, as the gaps may be watched and the defective cylinder identified. When the engine is somewhat slowed down on the highest speed, with full throttle, missing is most easily detected by this means. When a spark does not occur at the gap the explosion in that particular cylinder must have been missed. If no spark gap is provided it is sometimes possible to discriminate the defective cylinder by successively cutting out the sparking plugs. This may readily be done by means of a screwdriver having a wooden handle, the blade of which is made to simultaneously touch the engine and the head of the plug, which it is desired to short circuit. The engine should be speeded up as much as allowable, by means of the throttle, and the successive short circuiting of the plugs performed. When the ignition of a cylinder, which is working properly, is thus cut off the engine will slow down considerably, and will probably work somewhat irregularly, as the defective cylinder or cylinders are still in action, but when a cylinder, which is missing badly, is thus cut out the speed will be very slightly reduced, and the action of the engine will become more regular. After a little practice it is easy to determine which cylinders are doing full work and which are not.

If the missing is confined to a single cylinder the trouble is generally easy to locate and does not usually denote a general failure of the ignition system or lack of current. The sparking plug of the defective cylinder should be removed, carefully cleaned with waste dipped in petrol, and tried again, unless it is obviously broken, in which case it should be replaced by a plug known to be perfect. The sparking points should ordinarily be separated not more than a "strong" thirty-second of an inch. In case the trouble still persists, the coil belonging to the defective cylinder should be examined and the ear placed close to the trembler to ascertain that it buzzes at perfectly regular intervals and with a sound of uniform pitch. If it does not, or if there is an excessive or irregular spark between the trembler points, the trouble may be there. The points should then be carefully cleaned with emery cloth and the adjustments manipulated until the best possible action of the buzzer is obtained, and the adjusting screws made tight. In case the buzzer still fails to respond properly, it may be that the primary wire between the coil and the contact device is broken or short circuited, or that the contact device makes a poor contact for that particular coil, although this is unlikely, as some other cylinders would then probably be affected.

If, on the other hand, the trembler of the defective cylinder is working regularly and energetically, the trouble is likely to be in the secondary, and the secondary wiring should be examined to see that it is not broken and that the discharge is not taking place through some poorly insulated portion of the circuit to some metallic part of the car, thus cutting out the sparking plug. There is, too, a remote possibility that the secondary of the coil may have broken down, but this hardly need be considered. It is fairly certain that the trouble in the defective cylinder will be located at one or the other of the points mentioned.

If, instead of a single defective cylinder, there is a general failure of ignition, resulting in the stoppage of the car or very erratic operation of the engine, the natural thing to do in the case of accumulator ignition is to change the battery. Both batteries of a well kept car are always assumed to be in perfect condition at the start of a long run, and so when the second set is switched on it is reasonable to assume that it is of full power. If only the battery was at fault perfect ignition will be restored, but in case the change does not remedy the difficulty it is highly probable that one of the "common" wires may have been broken, i.e., one of the wires upon which all cylinders depend. These are the wires from the switch, and the wire or wires which connect to the engine frame and earth the system. These should be inspected to see that they are perfect, and if broken should be replaced. It is possible that the trouble may be in the contact maker. The travelling brush which makes contact with the segments may be broken or disconnected, or, in the type of contact device which use steel springs, one or more of these may have broken. After long use the metal contact segments sometimes wear down below the level of their insulation, so that the brush makes a poor contact, and the segments and their insulation then require to be turned off in a lathe or repaired temporarily with a file. Where platinum contacts are used no dirt should be allowed between the points, and they should be bright and clean. The adjustment of the screws holding the stationary platinum contacts should be set so as to give a sufficiently long and firm connection. It will generally be found that if the battery is good and the common connections are all perfect some of the cylinders, at least, will work properly.

In the rare instances in which the stoppage of the engine is not found to be due to faulty ignition, and not until all parts of the ignition mechanism have been clearly demonstrated to be in good order, the

*Abstract of a lecture by Mr. Albert L. Clough before the Y.M.C.A. Automobile School, Boston, Mass.

carburettor should be inspected. The spraying nozzle should be demonstrated to be clear by removing its covering and depressing the float so as to force petrol through it. If it is not clear, a very fine wire may be used to make it so. The float should be shown to be free in its motions, and it should be proved that it operates its needle valve properly. The air intake may have been clogged by something sucked into it from the road, and it should be examined with this possibility in view. It seems superfluous to add that the tank should be examined to see if there is a supply of petrol, and that the petrol cock should be open, but many long stoppages have been more than once occasioned on these two accounts.

CLAIM AND COUNTER CLAIM.

At the Windsor County Court, F. Brown, a cab proprietor, and J. Brown, his brother, driver, have sued James Horlick, of Gloucester, on a claim made up as follows:—Loss of use of horse, £8 10s.; loss of use of horse at £1 per week, £8; damage to harness, £1 10s.; damage to a vehicle, £4; total, £20; claim for personal injuries to John Brown, £30; total claim, £50. There was a counter claim for £25 for damage to defendant's motor-car. After hearing the case his honour in summing up, said there was a duty cast upon anyone coming out of a side street into a main road to exercise care. The point he had to decide was, was there negligence on either side? The important question was where the collision took place. He had come to the conclusion—though with some doubt—that there was negligence on the part of the defendant's chauffeur. With regard to the driver Brown, his Honour did not think the blow was given by the motor-car; he thought the plaintiff was negligent in not being able to pull up at once. He found the collision

THE USE OF AMPEREMETERS IN CONJUNCTION WITH INDUCTION COILS.

WE have received the following interesting communication relating to the use of amperemeters in conjunction with induction coils from the United Motor Industries, Ltd.:

The use of an amperemeter with induction coils is of very considerable advantage from several points of view, the most essential of which are, A, to determine and obtain synchronism of the tremblers, B, to work the coil at a safe consumption. Without an amperemeter it is absolutely impossible to get either of the results above mentioned, as without the instrument clearly and accurately showing the current the coil is taking, adjustment becomes mere rule of thumb and guess work, which is not satisfactory. It may not be generally known that the lag of trembler coils is very high, that is to say, the difference in time between when the contact is made and when the first inductive spark occurs at the plug, even with a high speed trembler such as the "Castle." The lag, of course, also increases as the speed of the engine becomes greater and runs to as high as 52 deg. of a circle. Again, the lag advances as the consumption of the coil increases. This is the most important fact in the matter, as, if one considers the question carefully, it follows that if the different units of a multiple coil consume different currents then the sparking occurs at different periods comparatively in the cylinders, instead of occurring at the same precise position of each piston in each cylinder. This means a difference in the explosive force in each piston, unevenness of torque, consequently a jerky drive and increased noise and rattle.

In order to determine the actual difference in the lag of tremblers we have constructed a special machine for the purpose, which is

Touring in Spain.—A Daimler Car at the Pillars of Alameda, at the foot of the Guadarrama Pass.

took place in the middle of the road, and he thought although there was negligence on the part of the chauffeur, the question was not without doubt. He was of opinion that Brown being an ordinary careful driver should have pulled up, that he was guilty of want of care in coming out of the Eton road at a speed that was unreasonable. His Honour found a verdict for the defendant upon the claim and for the plaintiff upon the counter-claim. Upon application costs were allowed the plaintiff on the counter claim and for the defendant on the claim, to be taxed by the Registrar.

CHARGE OF MANSLAUGHTER.

At the Central Criminal Court, on the 9th inst., Crawford Davis, a chauffeur, was indicted for the manslaughter of Maria Munday, a widow, who died in St. George's Hospital on December 24th from the effects of injuries sustained through being knocked down and run over by a motor-car which he was driving. The facts of the case have already been reported in the *M.O.J.*, and after hearing evidence Mr. Justice Bigham, in the course of his summing up, said it was impossible for him to indicate the dividing line between mere negligence and gross and culpable negligence. It was entirely a question for the jury to decide upon the evidence. Motor-cars were bewildering, and sometimes terrifying to elderly people, but they were of great benefit to the public, and were things people would have to reconcile themselves to whether they liked them or not. At the same time they must be handled with very great care, and drivers of them must remember that foot passengers had as much right to the road as anyone else. The jury found the prisoner guilty, and sentence of six months' hard labour was pronounced by the judge.

extremely simple, being a commutator with an angular segment so that the length of contact can be altered. On the same shaft is fitted an insulated high tension "live" finger, the point of which runs close to and round the face of a ring on which is marked the degrees from zero to 360. When at rest and when the commutator first makes contact the high tension spark is seen at the zero point.

A table follows giving the position of the first spark at varying consumptions and varying speeds, all other conditions being equal:—

Consumption at rest.	Consumption running.	Revs. of commutator shaft.	Length of segment.	Position of first spark.
Amps.	Amps.			
.75	...	6	...	2°
.75	...	6	...	12°
.75	...	6	...	36°
1.0	...	7	...	5°
1.0	...	7	...	16°
1.0	...	7	...	43°
1.5	...	9	...	8°
1.5	...	9	...	23°
1.5	...	8	...	50°
2.0	...	1.1	...	12°
2.0	...	1.8	...	36°
2.0	...	1.2	...	60°

Now, taking for instance a four-cylinder engine with 4 in. stroke (bore of no importance) and a quadruple coil with "Castle" tremblers. Let the firing position at the retarded point be at the top of the stroke in the cylinder, and let each trembler be adjusted to .75 amperes (not running) for No. 1 cylinder, and 2 amperes No. 2 cylinder, 1.5 amperes No. 3 cylinder, and 2 amperes No. 4 cylinder, a general adjustment

RESILIENT ROAD WHEELS.*

BY G. STUART OGILVIE, J.P.

which we might mention in our experience is by no means uncommon: we have often come across quadruple coils running at varying consumptions from 1 to 4 amperes, so that in taking this particular instance we are taking an average. Then we have at, say, full advance (reckoning on a 60 degree full advance) at 932 commutator revolutions or 1,864 engine revolutions, No. 1 cylinder firing 1.15 in. from the top of the stroke, No. 2 cylinder .97 in., No. 3 .82 in. and No. 4 cylinder .575 in.; a position of affairs which is not likely to give one the sweetest running, and which is indeed most detrimental to the life of the instrument. More mysterious knocking is caused by this than one would imagine. Again, the use of a meter enables one to gauge to a nicety the proper and safe consumption for any type of coil, once the owner has been informed of the proper consumption which is best for all-round purposes. This consumption, whatever it is, can be checked periodically, especially when any alteration to the adjustment is made in the manner of filing of the platinum points, replacing of screws, blades, or armature, when it becomes difficult to most people to adjust the tremblers to give the best results. The use of an amperemeter will decrease this work very considerably.

One cannot accurately by the sound of the trembler, nor yet by the appearance of the spark, tell if a section is performing its work properly. A good strong buzz is as likely as not due to the fact that the consumption is high, or, in other words, that the tension of the armature spring or platinum blade is too great. The appearance of the spark also is very deceptive. The length of the spark may remain about the same, but its fatness and heat may be considerably increased, and yet to the unpractised eye appear approximately the same. This will show that a meter is a most necessary factor for determining the coil output. One of the dangers of a coil consuming too much current is the general melting of the insulation both contained in the bobbin and surrounding it, resulting in a considerable attenuation of the spark, which from that time forward cannot be rectified. This attenuation is given in the figures as under:—

Continuous consumption 2½ amps.				
Starting temperature reading of thermometer 18.6° Cent.				
Time.	Temperature of wax.		Length of spark.	
Zero	...	18.6°	...	15 mm.
½ hour	...	25.2°	...	14 "
1 "	wax melting	32.4°	...	14 "
1½ "	"	36.2°	...	14 "
2 "	"	38.3°	...	14 "
2½ "	"	41.4°	...	13.5 "
3 "	"	44.3°	...	13.5 "
3½ "	"	47.6°	...	13 "
4 "	"	49.4°	...	13 "
4½ "	"	50.0°	...	13 "
5 "	50 Cent., end of thermometer reading	...	12	"
5½ "	"	"	12	"
6 "	"	"	12	"
6½ "	"	"	12	"
7 "	"	"	11.5	"
7½ "	"	"	11.5	"

This test was carried out by embedding into the insulation of the wax surrounding the bobbin an ordinary Centigrade thermometer.

It is hoped that the absolute necessity to use an amperemeter has been shown for all who have induction coils on their cars for firing the cylinders, either in permanent use with a cut out switch, or carried in the spare kit on the car. Needless to say, the "Castle" amperemeter we have introduced is specially constructed for induction coils—that is to say, it does not register the alternating currents in the primary due to the action of the condensers. It is of solid construction throughout, and has a flanged lacquered brass case with silvered dial and bevelled glass. The readings are from zero to three, which is ample for all coil purposes. The action is particularly and absolutely dead beat, and the needle is not affected even by severe vibration.

POLICE TRAPS.

A POLICE trap has been established at Maidstone Road, North Cray, near Bromley, Kent.

POLICE watchfulness is keen in the Greenwich district, as we are informed by a gentleman, well known in Shaftesbury Avenue, W.C., who was "trapped" there on Sunday.

LOCAL sportsmen in Newmarket are calling upon the police to rigorously enforce the ten-mile limit in the town.

In a recent issue we referred to the splendid record run between Bombay and Calcutta on a 24-h.p. Deasy car. We now learn the actual time was 5 days 19 hours 20 min., notwithstanding a delay of fourteen hours owing to a bad smash into a wall. The actual distance run was 1,632 miles.

THE weather in Scotland recently has been exceedingly bad, and but few motorists have had the temerity to venture out on the roads. Among the exceptions, however, is Mr. Alexander Shaw, who one day drove his 18-h.p. Siddeley car home to Edinburgh from a point forty-five miles north of Aberdeen. The roads were covered with snow and ice all the way, and scores of people were skating on the highway, on which the snow has frozen hard. In spite of the bad conditions, however, Mr. Shaw and his party travelled the 119 miles in exactly five hours.

The subject of the paper is—"Resilient Road Wheels and their Economic Relation to the Automobile." The automobile to-day—exclusive of the tyre bill—is the cheapest form of land locomotion known to man. In the recent 15,000 Miles Reliability Trials, the extraordinarily cheap mechanical upkeep of both the Hotchkiss and the Rolls-Royce cars are on record. By the courtesy of Lord Russell I am in possession of certain figures in reference to the cost of the mechanical upkeep of his 30-40-h.p. Daimler car, fitted with a heavy limousine body with an average running load-weight of 4,358 lbs. Lord Russell's figures happen to be peculiarly interesting, inasmuch as they tally almost exactly with the sum spent by myself on a sister 30-40-h.p. Daimler, carrying a slightly heavier body. In both cases the period under observation covered over 10,000 car—or about 21,000 ton—miles running. I find that Lord Russell's maintenance bill came to £45 13s. 5d., while mine totalled £46 13s. 7d. That is to say, in both cases the cost of mechanical upkeep worked out at almost exactly ½d. per ton-mile. Now, splendid as were the results of the Rolls-Royce car, I am not sure that the conduct of these two sister Daimlers—running, as I have pointed out above, under absolutely normal touring conditions in the hands of untrained amateurs—is not yet more remarkable and significant. An inherent modesty prevents my too closely insisting upon the average speed of my own Daimler car. Now let us see, again from actual figures, what was the cost of maintenance of the resilient road wheels of these cars. The total pneumatic tyre cost of these four cars appears to work out as follows:—Lord Russell's Daimler, average running weight 4,358 lb. (on Continentals), 8d. per car-mile—or, say, 4d. per ton-mile. On my Daimler, 4,760 lb. (mixed makes), 7½d. per car-mile—or, say, 3½d. per ton-mile. The Rolls-Royce, 4,435 lb. (Dunlops), 5½d. per car-mile—or, say, 2½d. per ton-mile. On the Hotchkiss, 4,748 lb. (Michelins), 6½d. per car-mile—or, say, about 3½d. per ton-mile. While on Mr. H. R. Pope's Itala car, in its record run from Monte Carlo to Havre, the average life of each driving-wheel cover sank as 244 miles, working out at 13d. per car-mile for back wheels only. Lord Russell finished his 15,000 miles on Palmer tyres with vastly better results to his own pocket. This, however, appears to have been chiefly due to the praiseworthy generosity of the Palmer Company, who presented him with seven outer covers and one inner tube either gratis or at specially reduced prices, showing a saving of £70 18s. 6d., or 40 per cent. on the entire bill. Lord Russell is also careful to point out that he has entered the cost of all tyres used as that of the 1907 price list, showing a further saving on eleven covers and six inner tubes purchased in 1906 of £36 11s., or another 20 per cent. on the entire bill. If these figures are correct, the Palmer tyre bill would average 4½d. per car-mile, or, say, 2½d. per ton-mile. We find, therefore, in every one of these cases that the cost of maintenance of the resilient wheel comes out at five times as much as the cost of the maintenance of the whole of the rest of the chassis. How far detachable rims and spare wheels (of which the Rudge-Whitworth spare wheel seems to be by far the best, if not the only engineering device) and the thousand and one other makeshifts which are being put on the market to minimise the unreliability of the pneumatic tyre, may succeed, it is difficult to say.

The essence of any practical road wheel is that it shall be capable of conveying heavy weights at high speeds over uneven surfaces, without injury to itself, its axle or the chassis and load borne thereon. Furthermore, in a power-driven wheel it is essential that the transmission gear, which conveys the torque of the engine to the road wheel, shall be protected against road shocks, and, still more, against the sudden strain of overcoming the inertia of heavy weight when starting, by some subsidiary baffling agent. To do this—1. The wheel must possess stability—lateral and circumferential. 2. It must absorb vibration. 3. It must yield to concussion. 4. It must be durable, and therefore economic. 5. It must be simple of design, accessible of detail, and easy to repair. 6. It must not, when power-driven, convey the torque of the engine through its primary resilient medium. 7. It must convey this torque through a secondary resilient medium. 8. It must distribute the axle weight over as wide a superficies of resilient material as possible. 9. It must "sit down on the road"—that is to say, resilience must be obtained without the tread of the wheel losing its friction drive off the road surface. 10. It must give fair warning of approaching collapse arising from wear or accident. 11. It must be easy of draught. 12. It must be silent in running. I would add, not as essentials, but as highly desirable qualities of the ideal wheel, that—It should be impervious to atmospheric conditions. It should be elegant and pleasing to the eye.

If, by reason of its elusiveness, compressed air is found to be an unsuitable resilient medium for motor wheels, our only alternative is a spring wheel. The new resilient road wheel is known as the Vico wheel. Subjectively every detail of the Vico wheel is new and original; objectively, the idea of a floating rim, with some form of resilient medium intercolated between the said rim and the hub member is as old as the eternal hills. The essence of the Vico wheel lies in the method of correlating these two members. Previous inventors have not made allowance for the circumferential as well as the vertical movement of any inflexible floating rim upon its hub member. Without such an allowance obviously no pivotal action is possible, because the floating rim becomes

* From a paper read at the Royal A.C. on Thursday, January 9th, 1908.

locked on the horizontal and radial line of the wheel, and is unable to follow the deflections of the resilient medium within. In other words, a wheel thus designed becomes at certain periods of each revolution a rigid wheel, bearing its axle weight upon a girder formed by the lower half of the floating rim. This circumferential allowance, then, is the novelty in the Vico wheel. Further patentable matter is afforded by the Vico buffer stop, which gives a spring drive independent of, but co-ordinating with, the action of the primary resilient medium—viz., a series of rubber rollers superimposed in a suitable race between the floating rim and the felloe of the rigid wheel or hub member. The rim and felloe are correlated for driving purposes by four sets of buffer stops projecting from the felloe of the rigid member, and so disposed, that on account of the eccentricity of the rim and felloe, they come successively into engagement with corresponding drivers attached to the rim at a practically definite point of revolution of the wheel, one set of stops disengaging with their rim drivers as the next comes into operative position. While there is thus always a direct drive between the parts, this is achieved without detrimentally affecting the resilience of the wheel or its power of accommodating itself to the varying surfaces encountered on ordinary roads. It is obvious that extreme lateral rigidity is secured by this method of correlation. In the case of a driving wheel, in which the felloe stop encounters and drives the floating rim stop or driver, the arc of contact of the stops is in the forward half of the wheel in the direction of the tread. The driving action is very effectively illustrated by considering what occurs when a driving wheel encounters an obstacle. The first result of the joint effect of the driving and resisting forces is a yielding of the buffer stops and a simultaneous pivotal movement of the rim about the pair of stops then in engagement, and, during the pivotal movement, part of the weight of the car, usually supported on the lowest point of the rim, is thrown upon the forward rim stop, with the result that, in addition to the driving effort, the weight of the car itself assists the wheel to over-ride the obstacle. The moment of this auxiliary force will depend upon a number of factors, but, generally speaking, it will increase with the speed of the car, and, within limits, with the height of the obstacle. It will also depend upon the position of the stops in engagement at the moment of encounter with the obstacle.

I cannot but think that when the public mind has once realised the manifold superiority of the wire over the wooden wheel, there will be a strong revulsion of popular feeling in favour of the all-metal wheel. The first set of wire spokes fitted to these Vico wheels were found to be rather too light, and after about 1,800 miles' running several of them worked loose and were immediately replaced at home by my servant, an ex-coachman, demonstrating thereby the extreme ease with which a wire wheel can be repaired by unskilled labour. I took the opportunity, during my absence abroad, to send the wheels back to the Rudge-Whitworth Works to have stouter wires inserted. Since then, during the last 19,000 odd ton-miles running, these wheels have never been touched except for cleaning and lubricating purposes, and are apparently as good as the day they were turned out of the Rudge-Whitworth Works.

I will now give the cost for a pair of Vico driving wheels during £10,110 car or over 21,250 power-driven ton-miles.

Cost of Vico driving wheels per car-mile, 2-262d. ...	2½d.
Cost of Vico per power-driven ton-mile ...	1d.
Cost of pneumatics on driving wheels only, on same car and under same conditions, 6-554d. ...	6½d.
Cost of pneumatics per power-driven ton-mile, 3-008d. ...	3d.
Money saved by Vico wheels as compared with pneumatics under similar conditions on Daimler car 3020, per ton-mile ...	2d.

Here, then, we have at last succeeded in establishing something like a reasonable proportion in the mechanical maintenance and the resilient wheel maintenance of a heavy and high-speed car.

COMPANY NEWS.

ALEXANDRA MOTOR CAB COMPANY.—Agreement with W. Bowden and H. S. Phillips. 59-61, New Oxford Street, W.C.

M. AND W. MOTOR SYNDICATE.—£4,000. Agreement with E. G. Williams and P. Mavrogordato. 43, Great Windmill Street, W.

BURGESS AND HARVEY.—£5,000. To acquire the business carried on by W. H. M. Burgess at 40, Glasshouse Street, W., and to carry on the business of manufacturers, proprietors, agents for and dealers in motor-cars, &c. 40, Glasshouse Street, W.

RUDGE-WEDGE.—£1,000. Manufacturers of and dealers in cycles, motor-cycles, &c. Directors must be directors or employees of Rudge-Whitworth, Limited. 34, Spon Street, Coventry.

THE LONDON AND PROVINCIAL MOTOR-CAB COMPANY.—£100. J. THOMAS AND CO. (CARDIFF).—£5,000 (£1). Agreement with J. Thomas and G. W. O. Huddart, manufacturers of and dealers in motor-cars, &c. 2, Wellington Street, Cardiff.

FROM Vauxhall Motors, Ltd., comes a copy of the first number of the "Vauxhall Magazine," a little publication which is to be issued monthly in the interests of the Vauxhall cars.

MR. R. S. BYRNE, lately with the Times System Automobile Company, Ltd., and Messrs. J. Keele and Co., and who has an exhaustive knowledge of Darracq and other cars, is open to take up a new appointment.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

IN addition to paying 5s. per annum for each of its own members into the funds of the Motor Union, the Royal A.C. has made money grants to the Union as follows:—1903, £325; 1904, £360; 1905, £980; 1906, £1,078; 1907, £610; 1908, £850. The R.A.C. has further defrayed half the cost of speed limit inquiries, &c. In 1905 the Club also contributed £500 towards the fund for the collection of evidence for the Royal Commission on Motor-car Traffic, a joint committee of the Club and the Union having been formed for that purpose.

Premises have been secured by the Royal A.C. at 112, Piccadilly, as a London address for associates, in which will be found reading and writing rooms and facilities for light refreshments.

It has been decided that accommodation will be provided in the new club premises in Pall Mall for associates.

The Expert and Technical Committee are about to submit a report on the use of studded tyres to the committee of the Club. At the last meeting of the committee it was resolved that the Dewar Challenge Trophy for 1907 should be awarded to Messrs. Rolls-Royce, Ltd., in respect of the performance of their car in its 15,000 miles Long Distance Trial.

New members of the Club elected this year include the Marquis of Waterford, Sir Maurice Fitzgerald, Bart., Sir Alfred Jacoby, M.P., Major General F. A. Ogle, C.B., Sir W. B. Forwood, Lieut. J. W. McCowen, Messrs. Alfred Mond, M.P., W. S. Graves, J.P., J. I. Parsons, J. H. Storey, J.P., E. J. Wythes, J.P., and H. S. Foster, J.P.

In addition to selling the light tradesman's car illustrated above, Messrs. Panhard and Levasseur are hiring them, at a figure which relieves the hirer of any trouble and responsibility.

Driver, supplies, garage, cleaning, and all running repairs are all included in this contract. The chassis used are of the Panhard three-cylinder 8-11-h.p. model, but any type of body can be fitted.

MOTOR UNION.

ROOMS for members of the Motor Union are provided at the Tenby Hotel, Swansea; the Grand Hotel, Leicester; and the Station Hotel, York.

AUTOMOBILE ASSOCIATION.

BEGINNING with the popular Folkestone-Boulogne route, the Automobile Association Touring Department promises efficient attention to the welfare of tourists. Not only will the South-Eastern and Chatham Railway Company both in England and—in the person of the Chief Superintendent, Major R. D. Stevens—at Boulogne (who will act as the Association's agent), do everything possible to expedite matters, but a special Automobile Association representative will be in attendance at Boulogne on the arrival of every steamer. He will wear a miniature Automobile Association button-hole badge and will take charge of the landing arrangements, pay the various small fees, arrange for driving licences, obtain petrol, &c., and be at the disposal of members for all reasonable needs. Moreover, all these expenses can be arranged with the Automobile Association London offices before leaving, so that a member need not trouble about payments in respect of his car from the moment he embarks at Folkestone to the time when he drives away on the French roads.

SOCIETY OF MOTOR MANUFACTURERS.

AT the last meeting of the Council of the Society of Motor Manufacturers and Traders regulations were considered with regard to their November exhibition at Olympia. It was resolved to abolish trial rides in the vicinity of the hall. This has been recommended by the committee of management on the ground that the use of trial cars had been abused, and constituted a nuisance to the neighbourhood.

BROOKLANDS.

FROM the Brooklands Automobile Racing Club comes a copy of the speed tables, which will be of considerable assistance to officials and others attending Brooklands track during the coming season, enabling them to ascertain at a glance the miles per hour run by the cars at the conclusion of any of the laps on the track. Half mile, mile and kilometre tables are also given.

MIDLAND.

At a meeting of the committee of the Midland A.C., held on the 9th inst., the following resolution was passed by a majority of one, the chairman not voting:—"That a special meeting of the members of this club be convened to receive and, if thought fit, pass a recommendation from the committee to rescind the affiliation agreement with the R.A.C. and the Motor Union, and to enter into a new agreement with the R.A.C. upon the lines indicated in their circular.

The club will have a smoking concert on the 1st prox., at which a cinematograph display of motor-car incidents will be given.

HARROGATE.

ON Thursday of last week the annual meeting of the Harrogate and District Automobile Club was held at the Prince of Wales Hotel, Harrogate, under the presidency of Dr. E. N. Ozanne. The report was presented by Dr. Holroyd, hon. secretary, who referred to the year as one of considerable activity. He had been in communication with the North Eastern Railway Company with regard to level crossings, and they had promised to make investigations and remedy grievances where such existed. He referred to the important case with regard to the water rate for motor-cars, which had been decided in favour of motorists, and also to the speed judging and hill climbing competitions they had made during the year. The treasurer's report showed a credit balance of £61.

Dr. Ozanne was re-elected president, Mr. J. E. A. Titley hon. solicitor, Dr. B. Holroyd hon. secretary, and Mr. Birtwistle hon. treasurer. These, with the following gentlemen, constitute the committee:—Messrs. Watney, Holroyd, Little, T. E. King, E. Solly, Blamires, Fortune, T. C. Atkinson, Scott, and J. T. Simpson.

A discussion then took place with reference to the affiliation of the club to the various motoring organisations, and eventually it was agreed to leave the matter as at present until the end of 1908, the committee to give full consideration to the problem in the meantime.

YORKSHIRE.

At the Hotel Metropole, Leeds, on Tuesday of last week, Dr. S. Rumbold gave an interesting lecture to the members of the Yorkshire A.C. on "A Tour in Normandy." There was a good attendance, over which Mr. E. H. Hepper presided. The lecture was a capital description of a tour in Normandy—a country which must ever be interesting to English tourists. In the space of three weeks the lecturer seems to have seen all the interesting sights, to have been a keen observer, a diligent student of the historical associations of the places he visited, and above all to have been an enthusiastic and capable photographer. In the latter capacity the fruits of his labours were seen in a charming series of lantern slides, which were shown by Dr. Parkinson, and which added immensely to the realism of the lecture. At the close Dr. Rumbold was accorded a hearty vote of thanks.

NORTH YORKSHIRE.

At the committee meeting of the North Yorkshire A.C., held at York, the hon. secretary reported that arrangements had been made for the erection of motor warning posts at dangerous cross-roads in Tang Hall Lane, near York. A letter was read from the Westow Parish Council, calling attention to a dangerous corner on the road from Westow to Kirkham Abbey, and the hon. secretary was directed to ask the East Riding County Council to erect the necessary warning posts. The hon. secretary reported that the dangerous corner where the Bishopthorpe road joined the York and Tadcaster highway was being improved by the Bishopthorpe Rural District Council, the necessary land for rounding off the corner having been given by Mr. Lycett Green. The Chairman submitted plans of an improvement proposed to be made at a dangerous corner at Staxton, on the road from Malton to Scarborough, and as it appeared that Lord Londesborough had undertaken to give the necessary land, free of charge, if the expense of widening the road could be defrayed from other sources, it was decided to bring the matter before the East Riding County Council with a view to their either carrying out the work or making a substantial contribution towards the cost.

SCOTTISH.

EARL CAWDOR, Mr. R. B. Haldane, M.P., Secretary for War, Sir Walter Thorburn, Col. R. G. Ramsay, Capt. Cameron of Lochiel, Mr. A. H. Nasmyth, J.P., and Miss J. M. Cunningham have been elected members of the Scottish A.C.

A draft of the Lighting of Vehicles (Scotland) Bill, which it is proposed to have introduced into the House of Commons during the coming Session of Parliament, has been finally approved by the committee.

At the meeting called on Saturday to form a club for Sutton Coldfield, a committee was appointed, with Mr. Howard Lane, of the Beeches, Anchorage Road, Sutton Coldfield, as hon. secretary *pro tem*.

IRISH.

LAST week, at the Gresham Hotel, Dublin, about 200 motorists attended the dinner of the Irish Automobile Club, over which Sir Horace Plunkett, K.C.B.O., presided.

In proposing the toast of "The King," Sir Horace referred to the motor-car trips which his Majesty had taken in the poorer districts of Ireland in 1905. The toast having been duly honoured, that of "Our Guests" was given, coupled with the names of Messrs. J. W. Orde, E. M. C. Instone, and C. W. Henderson, all of whom replied. The toast of "The Irish A.C." was proposed by Mr. Claude Johnstone, and in responding Sir W. G. B. Goff, Bart., referred to the progress of the motor business in Ireland, and mentioned that the Irish Club now had a membership of 500. A tribute was paid to the untiring exertions of Mr. E. White, hon. sec., Mr. W. Sexton, hon. treasurer, and the vice-chairman, Mr. Talbot Powell. The toast of "The Dublin Motor Show" was voiced by Mr. P. W. Cairnes, and in reply Mr. E. White referred to the number of exhibits at Ballsbridge as highly creditable having regard to the difficulties of transport. Mr. J. C. Percy also replied on behalf of the Show Committee, and the toast of "The chairman," proposed by Mr. J. Ellis Goodbody, concluded the speechmaking.

THE committee of the North Herts A.C. is of opinion that the interests of the club will best be served by supporting the Motor Union.

A GENERAL meeting of the Brighton and District Motor Cycling Club will be held on Tuesday, the 28th inst., at the Royal Pavilion Hotel. Intending members may obtain full particulars from either Mr. Harold Clifton, 68, Ship Street, Brighton, or Mr. R. W. Cartwright, 63B, North Street, Brighton, the joint hon. secretaries.

AUSTRALIAN RELIABILITY CONTEST.

THIRTY-ONE motor-cars belonging to members of the Automobile Club of Victoria took part in the Sealed Bonnet Motor Reliability Contest recently held. It took the form of a three days' trial, the routes being from Melbourne to Camperdown, from Camperdown to Ballarat, and from Ballarat to Melbourne. Twenty-nine of the competitors completed the journey.

Cars were required to travel within certain limits of speed, and the bonnets of the cars were sealed before the start each morning. One hundred points were credited for each day's run, and certain penalties for unreliability were deducted. A competitor who removed a bonnet seal forfeited ten points, and if at the finish the axle of his car was bent five points were deducted. Another five points were forfeited for each spring broken, and there were also penalties for infringements of the time regulations. A gold medal and club certificate will be awarded to every contestant who scored the maximum of 300 points, a silver medal and club certificate to each contestant who scored 280, and a bronze medal to each contestant who scored over 260 points.

The result of the main competition was as follows:—

Name.	Car.	Points Scored.
Dr. Weigall ...	8-h.p. De Dion ...	300
W. J. Proctor ...	8-h.p. De Dion ...	300
W. A. Korner ...	8-h.p. De Dion ...	295
CLASS B.		
A. H. Bell ...	8-10-h.p. Tarrant ...	300
O. Camplin ...	8-10-h.p. Darracq ...	300
H. E. Farrow ...	7-h.p. Singer ...	300
Dr. Balfour ...	8-10-h.p. Humber ...	300
CLASS C.		
H. H. Sich ...	14-16-h.p. Argyll ...	285
Captain H. Tarrant ...	12-14-h.p. Argyll ...	300
H. Franklin ...	12-16-h.p. Talbot ...	300
W. Dalrymple ...	15-h.p. Talbot ...	300
J. Moffat ...	15-h.p. Talbot ...	269
A. H. A'Beckett ...	10-12-h.p. Humber ...	290
A. O. Barrett ...	15-h.p. Talbot ...	300
C. F. Holmes ...	15-h.p. Humber ...	300
C. B. Kellow ...	15-h.p. Talbot ...	300
CLASS D.		
E. G. F. Loder ...	Cottin-Desgouttes ...	300
C. F. Millar ...	15-h.p. Talbot ...	300
E. Manifold ...	24-h.p. Minerva ...	300
C. H. Campbell ...	30-h.p. Daimler ...	300
W. B. Wilkinson ...	—	300
H. A. Currie ...	20-h.p. Rolls-Royce ...	300
R. M. Nissim ...	15-h.p. Siddeley ...	276
W. H. Davidson ...	40-h.p. Napier ...	300
H. L. Stevens ...	40-h.p. Darracq ...	300

The following competitors also completed the course, but do not receive any award:—D. Thompson, 16-20-h.p. Humber; Count von Horn, 20-h.p. Cadillac; F. Vallender, 9-h.p. De Dion; A. T. O'Keefe, 20-h.p. Darracq.

The following is the final result of the contest:—Most Meritorious Performance (trophy value £10).—W. J. Proctor, first, on 8-h.p. De Dion. Hill Climb (trophy value £5).—W. J. Proctor, first, on 8-h.p. De Dion. Speed Test (trophy value £5).—W. J. Proctor, first, on 8-h.p. De Dion. One of the conditions of the contest was that no competitor

was eligible to receive more than one prize, therefore the hill-climbing and speed trophies go to the competitor obtaining second place. Mr. W. Dalrymple, on a 15-h.p. Talbot car, secured second place in the hill climb, consequently is awarded the £5 trophy for that event. Dr. R. E. Weigall, on an 8-h.p. De Dion, having secured second place in the speed contest, is awarded the £5 trophy.

CASES UNDER THE MOTOR CAR ACT.

A QUADRUPLE SUMMONS.

James Lever, of 101, Lawes Road, Fulham, appeared before Mr. Garrett, at the West London Police Court, on the 8th inst., on four summonses for driving a motor-car in a dangerous manner on November 21st, failing to give audible warning of his approach, failing to produce his licence, and neglecting to have affixed to the car a proper identification mark. It was stated that a horse-omnibus was going along Lillie Road, Fulham, and when it had reached the junction of that road and Fulham Palace Road a passenger alighted. Just then a motor-car driven by the defendant came round the corner at a rapid pace from the direction of Putney, and before the passenger could get out of the way the car bore down on him and carried him a distance of some eight or nine yards. After the accident questions were put to the defendant and to another man, who was in the car, the latter saying that he was the owner of the car, and giving his name as John Smith, 52, Hartismere Road, Fulham. Subsequent inquiries disclosed the fact that that was a false statement, and nothing more had been seen of that man, nor was the ownership of the car yet established. The car bore a manufacturer's identification mark—A 3 R X, and that was a mark assigned to Mr. Patmore, of the Rocket Cycle Company, 45, The Broadway, Walham Green. Inspector Elliott called at that shop, and, learning that no car of the company bearing that mark was out on November 21, saw the defendant, who told him that all he knew was that on November 21st this other man, whom he only knew by the name of Smith, brought the car, with that mark on it, to his shop to be repaired, and that afterwards they rode out together to test the repairs. For the defence, Mr. Hanson urged that the whole affair was an accident. He called the defendant and two witnesses to support the theory of the defence. Mr. Garrett observed that, while morally the real person responsible for the misuse of the identification mark was the mysterious Mr. Smith, the defendant was legally liable, and he hoped that at the conclusion of the case the defendant would find Mr. Smith, and make him contribute towards the penalty. His worship imposed penalties amounting to £20, with five guineas costs.

DISMISSAL.

At the South Shields Police Court a motorist's case has been dismissed, his defence being that he was not travelling faster than the motor-buses of the North Eastern Railway Company.

EXCEEDING LEGAL LIMIT.

Four motorists were fined £5 and costs at Barnet on the 8th inst. for exceeding the legal limit at Prickler's Hill, on the Great North Road; on the same day fines of £3 were inflicted on three motorists who exceeded twenty miles an hour along Parkside, Wimbledon Common.

On the 9th inst. twenty motorists, including Mr. W. Heaton Armstrong, M.P., were fined at Kingston for exceeding the legal limit in Richmond Park.

On Monday five motorists were fined sums ranging from £2 to £5 for exceeding the legal limit at Epsom.

For exceeding the legal limit in Shooter's Hill Road, Blackheath, a motorist was on Tuesday fined 40s. and costs at the Greenwich Police Court.

REFUSING INFORMATION.

Messrs. J. E. Hutton (Limited), Shaftesbury Avenue, W.C., answered an adjourned summons, at Marlborough Street (London) on Saturday, for refusing to give information as to the identity of a person who drove a motor-car belonging to them in a dangerous manner, on October 12th, along Queen's Road, Walton-on-Thames. Mr. H. Muskett prosecuted for the Commissioner of Police. The case, which had been adjourned since December 20th, was placed before the magistrate, Mr. Mead, as one of considerable importance, as the company had absolutely refused to give Inspector Cooper any information to show who the driver of the car was. The evidence showed that only the number of the car could be obtained, owing to the furious pace at which it was driven. Two previous convictions for similar offences at Grantham and St. Neots against the company having been proved, counsel for the defence urged that the wrong official of the company, the managing director instead of the secretary, had been applied to for the required information. As a matter of fact, it was not known who was the driver of the car on the day in question. Mr. Mead imposed a fine of £30, with £5 costs.

A REAR LIGHT TROUBLE.

Frank Fox was charged at Lichfield with driving a motor-car without having a rear light. P.C. Eley said he noticed that the rear lamp was out. He whistled to defendant, who immediately stopped, and he then drew his attention to the lamp. Defendant lit the lamp, but before he had gone far the lamp went out. Defendant then went to the shop of Messrs. Jones and Co. and bought a new lamp. Mr. Jones was then called, and stated that defendant called on him at the Talbot House Garage. Fox told him that he had had a lot of trouble

on the journey from London. The burner of the lamp did not hold the wick up properly. The lamp was warm when the car stopped at the garage. He purchased a new lamp. A letter was read from Mr. Harry Tate, the comedian, stating that he regretted that the lad could not appear, as he was engaged at the Theatre Royal, Manchester, playing the part of the front legs of the elephant, which might sound ridiculous, but was nevertheless a fact. He asked the Bench to deal leniently with accused, as he was a trustworthy servant.—After a consultation the Bench decided to order defendant to pay the costs of the case, 6s. 6d., and to pay 10s. to the poor box. Mr. Jones immediately paid the amount.

DRIVING TO THE COMMON DANGER.

Ernest Garnett, chauffeur, was, at Guildford, fined £20 and his licence was suspended till it expires on March 20th, for having driven to the common danger at Thursley. The police stated that defendant drove down the hill on Portsmouth road at the rate of fifty miles an hour. Mr. Staplee Firth, who defended, elicited that there was no one else on the measured quarter of a mile, and submitted that there was no public danger. He thought defendant's employer would appeal. The chairman said defendant would be disqualified from holding another licence till December 31st.

AN ACQUITTAL.

At the Kingston-on-Thames County Bench, on Saturday, before Mr. W. Y. Cockburn and other magistrates, David Bentley, a mechanical engineer, residing at Thames Ditton, was charged with the manslaughter

The 40 h.p. Crossley Limousine which Messrs. Jarrott and Letts have just supplied to Lady Alwyne Compton.

The chassis was sent to France to have the carriage body fitted by Messrs. Drignot. The car is painted dark blue picked out with white lines, and the upholstery is finished in brown corded cloth with lace trimmings to match, fold-up extra seats of a special pattern being also provided.

of Theophilus Cooper, formerly the landlord of the Clarence Hotel, Kingston, who died from the effects of injuries sustained in a collision with a motor-car driven by the prisoner on the Portsmouth road, at Esher, on December 8th. At the inquest on the body of Mr. Cooper the jury returned a verdict of "Manslaughter" against the accused. Addressing the Bench for the defence, Mr. C. F. Gill, K.C., submitted that there was not sufficient evidence of negligent driving on the part of the prisoner to justify them in committing him for trial on a charge of manslaughter. The accident was obviously caused by the skidding of the motor-car, as it was facing the governess-car, and although it was a lamentable thing that a man should lose his life, it was not right that another should be convicted of manslaughter unless gross carelessness could be shown. Prisoner then gave evidence, and declared that what he observed first was the light of a cycle, and as he was approaching it he saw a dark object loom up suddenly in front of him. Then he applied his brakes, which made the car skid, and to stop the skidding he released his brakes, with the result that his car struck the governess-car and it overturned. At this point the chairman said the Bench did not wish to hear any more evidence. It was a case that should have been brought before the Bench, but having heard what took place they were satisfied it was a case that should not be sent for trial. Prisoner was therefore discharged.

Mr. THOMAS BUTLER, of Charnwood, Cotham Park, Bristol, has just returned from a tour in Switzerland with his Iris, and writes that he "did not come across a single covered car we could not pass on the level or on the hills."

FORTHCOMING EVENTS.

JANUARY, 1908.

- 18th-Feb. 2nd.—Automobile Exhibition at Turin.
 20th (M.).—Manchester A.C. annual meeting.
 21st (Tu.).—Annual meeting of the Yorkshire A.C., Hotel Metropole, Leeds.
 22nd (W.).—Annual meeting of the Southend M.C.
 The Incorporated Institution of Automobile Engineers will meet at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., at 8 p.m. The following papers will be read:—"Front Driving, with special reference to Electric and Hydraulic Transmission," by Dr. H. S. Hele-Shaw, LL.D., F.R.S.; "The Front Driving of Steam and Petrol Vehicles," by Mr. R. W. Harvey Bailey, A.K.C.; and "A resumé of Front Drive Patents," by Mr. J. S. Critchley.
 The annual regimental dinner of the Army Motor Reserve will be held at the Trocadero Restaurant, London.
 Inquiry at Belfast into the application of the City Council for a ten mile speed limit on all roads through the town.
 24th (F.).—Annual dinner of the Scottish A.C. at Edinburgh.
 24th (F.)-Feb. 1st.—Scottish Motor Exhibition in the Waverley Market, Edinburgh, to be opened by Lord Kingsburgh.
 26th (Sun.).—Criterium de Voitures and Coupe de l'Exposition Trial for motor-cycles organised by the Turin A.C. and the Motor Club of Italy.
 27th (M.).—Annual general meeting of the Motor Cycling Club at 8 p.m., at the Tudor Hotel, London, W.
 29th (W.).—First lesson of the course to be given by Mr. R. S. Currie to the Ladies' A.C.
 30th (Th.).—Annual dinner of the Yorkshire A.C.
 31st (F.).—Annual meeting of the Blackheath A.C.

FEBRUARY.

- 1st (Sat.).—Annual meeting of the Lincolnshire A.C.
 2nd (Sun.).—Reliability Trial of the Motor Union of Western India.
 7th-15th.—Manchester Motor Show at Belle Vue.
 12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 15th (Sat.).—Auto-Cycle Union Annual Dinner.
 20th (Th.).—Meeting of the Essex M.C.
 24th (M.).—Motor Show at Bombay.
 27th (Th.).—Mr. Mervyn O'Gorman at the R.A.C. on "Gear Transmission."

MARCH.

AUTOMOBILE ACCIDENTS.

Two men have been removed to the West London Hospital, suffering from serious injuries caused by being thrown to the ground at Hammersmith owing to a motor-omnibus colliding with the scaffolding they were on.

WHILST motoring into Cheltenham from Gloucester with four others on Saturday Mr. E. J. Boodle, of Gloucester, was thrown out of the car through a collision with a carrier's van. He fractured his skull and was taken to Cheltenham Hospital. The other occupants of the car were unhurt.

A BOY was knocked down and killed at Fareham, on Saturday, by a motor-car, which was going in the direction of Southampton. The boy was running behind a cart, and crossed the road, after the motor horn sounded, in an endeavour to save his dog, which darted in front of the car.

ON Saturday, at midnight, in Godstone Road, Purley, a motor-car proceeding towards Godstone ran into a man named Arthur Borer, of Little Roke, Kenley, who was walking in the opposite direction. He was carried about fifty yards, and the machine, not yet identified, is alleged to have passed on. The unfortunate man was picked up and

taken to Purley Cottage Hospital, where he was found to be badly injured.

WHILE Sir Alfred Hickman, ex-M.P. for Wolverhampton West, was motoring near Wolverhampton, a woman crossed the road and was knocked down in trying to avoid the car. A heavy railway lorry was following the car. The chauffeur, in trying to avoid the woman, swerved, but the angle taken was so acute that the car skidded right round, and collided heavily with the railway lorry. Sir Alfred and the chauffeur were thrown out, but escaped serious injuries. The injured woman, Mary Davis, is suffering from the shock.

ROAD REPORTS.

BANBURY.—Main roads under repair in the Banbury district during the next few weeks will be Oxford road, Bloxham road, Broughton road, Middleton road, Daventry road and Warwick road.

BRIDGE OF ALLAN.—The Secretary for Scotland has assented to the proposal for the limitation of the speed of motor-cars in Henderson, Keir and Union Streets, in the Bridge of Allan, to ten miles an hour.

LEYTON.—The Ratepayers' Association having urged that a motor speed limit of ten miles per hour was advisable in the High Road, Leyton, brought the matter before the District Council. The District Council forwarded the request to the Essex County Council, who wanted to know if any accidents have occurred in that thoroughfare owing to the reckless driving of motor-cars. And now the R.A. is endeavouring to ascertain the reasons for its request.

HELENSBURGH.—On the motion of the Provost, the Helensburgh Town Council has resolved to make application to the Secretary for Scotland to restrict the speed limit of motor-cars to ten miles per hour in certain streets in the borough.

KILMARNOCK.—At a meeting of the Kilmarnock District Committee of the County Council, Mr. Lang, the road surveyor, reported that the Fenwick to Flockbridge road was so much damaged by heavy motor-car traffic that from May last up till date the quantity of metal applied to it amounted to 2,100 tons, being 500 tons more than had been estimated for. The Chairman explained that they had agreed with Renfrew County Council to have a joint meeting with the parties who were causing the damage by heavy motor traffic. With the view of preventing dust, the Committee will lay down 800 or 1,000 yards of tarred metal in different parts of the district as an experiment.

BUSINESS NEWS.

AMONGST recent purchasers of Weigel cars are Mr. Gavin Shanks, of Coatbridge, and Mr. Leslie Fox, of Taunton.

MR. J. W. HEATH has resigned his directorship of the Albany Automobile Company, Ltd., 106, Albany Street, N.W.

AT the Dublin Show which closed on Saturday last 401 Dunlop tyres were fitted to cars and spare wheels exhibited on the various stands.

THE COVENTRY CHAIN COMPANY (1907), LTD., intimate that they have changed the address of their registered offices to Spon End Works, Coventry.

THE ANGLO-AMERICAN OIL COMPANY, LTD., inform us that they have reduced the wholesale price of Pratt's motor spirit and Anglo's 760 spirit one halfpenny per gallon.

MR. H. RAMOISY, who has just severed his connection as manager for the Germain cars, writes us from 7, Warbeck Road, London, W., that he is taking a short holiday before fixing up a new appointment.

THE motor tyre repair department of the Midland Rubber Company, Ltd., at Ryland Street, Birmingham, is excellently organised with a view to the prompt dispatch of work entrusted to the company.

MR. C. D. CLAYTON, who is well known to the motor trade in connection with Messrs. A. J. Wilson and Co, Ltd., has commenced business on his own account as a motor advertising agent and will shortly open offices in the vicinity of the Motor Club.

AT the distribution of awards at the Mansion House, London, a few days ago in connection with the 1906 Milan Exhibition, awards were handed to Messrs. Armstrong, Whitworth and Company, Ltd., E. M. Bowden, Ltd., Dunlop Pneumatic Tyre Company, Ltd., Greenwood and Batley, Ltd., J. and E. Hall, Ltd., J. E. Hopkinson and Company, Ltd., Humber, Ltd., Rudge-Whitworth, Ltd., Seamless Steel Boat Company, Ltd., John I. Thornycroft and Company, Ltd., and Willans and Robinson, Ltd.

AMONG the noticeable displays of body work at the recent Dublin Show was an Ariel car finished as a Parisian phaeton by Mr. William Vincent, of Castle Street, Reading. The vehicle is fitted with a folding Cape hood and wind screen. The colour of the body is a very choice shade of dark green, and is upholstered in a sage green leather. Another example of high grade work and material was seen in a landaulet body on a Unic chassis. This body is painted in dark green, and a very pleasing effect is obtained by lining it with black and bright crimson; the crimson line, while not being pronounced enough to be unduly obtrusive, has a wonderfully smartening effect on the whole of the colour scheme. The body is upholstered with green leather, and is fitted with a luggage extension over the driver's seat, and glass wind screen. The Shamrock car of Messrs. Straker and Squire, illustrated in our last issue, is also fitted with a very smart two-seated body by Messrs. Vincent, on whom the three bodies referred to reflect great credit.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, JANUARY 25, 1908.

[No. 464.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

NOT only are the preparations for the International Touring Car Trial of 1908 getting into shape, but manufacturing firms are anxiously watching each new item of information that comes forth with regard to its details. In order to develop the interest in the event the Royal A.C. has allowed news to filter through from Piccadilly—a policy that doubtless secures its purpose, but entails upon likely com-

petitors the necessity of watching carefully from week to week to make certain that no fact of importance is overlooked. Elsewhere we publish the latest information, and it is evident that the sub-committee that has been engaged in drawing up the regulations has not been laggard in its work. By the inclusion of the Brooklands track in the event a spectacular finish will be possible, while the Scottish A.C.'s itinerary will ensure a succession of hardships that should satisfy competitors and the public alike as to the reliability portion of the programme.

An English Minister on French Roads.

WHILE on the Continent recently with several Parliamentary friends, Mr. Lloyd George, the President of the Board of Trade, enjoyed the pleasures of motoring to the full. He motored practically all the way from London to Nice, and thus had the advantage of learning, at first hand, something of the excellent roads which are a feature of France. He was much struck with the way they manage the roadways in France, and doubtless will be able to give some useful information on the subject to Mr. John Burns, whose travels abroad have generally been on foot. Legislators have been able to realise the value of the motor-car in getting into Parliament, and apparently many of them are anxious to continue their automobile education when they have realised their ambitions.

Roadside Dangers to School Children.

AT the last meeting of the Wimbledon Education Committee an interesting discussion took place with regard to the dangers from passing motor-cars to which children proceeding to and from school are particularly liable. Ultimately it was resolved to approach the County Council as well as the Town Council on the matter. On several occasions we have drawn attention to the enterprise of some of the provincial automobile clubs in communicating with school teachers and others having influence with children as to the need of care being exercised when crossing the roadway. In France the idea has been even further developed and organised, so that a complete scheme of warning children has been devised in some important districts. If the local authorities in Surrey would give adequate attention to the subject they could do a great deal by enjoining the necessity of care in children in order to minimise the risk which they now run in crossing the high road. The matter has also received attention north of the Tweed, and suggestions for widening the roadway, reducing the angular character of the curves, and otherwise lessening the dangers in the vicinity

of the schools within their area are now before the Hawick District Committee of the Roxburgh County Council.

Motor-Cars in London.

AT the first meeting of the London County Council for the present year, the Public Control Committee reported that from October 1st to November 30th, 1907, applications had been received for the registration of 652 motor-cars, fifty-six heavy cars, and 107 motor-cycles, thus bringing the total number of these vehicles up to 17,963, 1,723, and 7,891 respectively. Changes of ownership in 442 cases had been dealt with, and the number of licences to drive motor-cars and motor-cycles issued was 2,415, bringing the total number up to 66,142. It is still contended by many registrars under the Motor Car Act that changes of ownership are not always notified, and we would again advise our readers who may dispose of their cars to take care that proper notice of such change of ownership is given to the authorities. Similarly any change in the colour of the body after the original registration should be made known to the registrar by whom the number of the car was assigned.

Drivers must be Warned.

IT is reported that another accident has occurred on the Brighton road, in which an automobile was concerned, the driver going away without waiting to render assistance. This is really regrettable, and we trust that owners of cars will impress upon their drivers not only a goodly fear of doing anything to endanger the lives of others, but also of the necessity of acting properly in the event of unfortunate accident. Nothing arouses the public feeling against motorists so much as the inhuman conduct of some isolated delinquents who have disgraced their calling. Much depends on the constant watchfulness of employers, and they should take care that their vehicles are not taken out without permission.

Front Driving.

BEFORE the Incorporated Institution of Automobile Engineers, on Wednesday, three papers were read on various aspects of the front driving of automobiles by Dr. H. S. Hele-Shaw, and Messrs. K. W. Harvey Bailey, and J. S. Critchley. Dr. Hele-Shaw advocated that more extended trials should be given to driving, steering and braking upon all front wheels. With regard to present developments he believes that the system of the four-drive vehicle has a great future in its application to heavy vehicles. Apart from prevention of side-slip, there are advantages in the case of such vehicles running in great cities with paved streets, where not only is manœuvring of great importance, but where rubber tyres are highly desirable, both to save the vehicle from shock and vibrations which occur with steel wheels on paved surfaces at even very moderate speeds, and to diminish the noise, which is found not merely objectionable by day, but almost unbearable by night. Further, the saving not only on tyres, but also on the vehicles, which may have to be accelerated or retarded possibly hundreds of times in a day, would be found to be so great as to far more than outweigh the additional cost of four-wheeled propulsion. In the course of his paper Mr.

Bailey took the Pullcar vehicle illustrated and described in our issue of November 30th, as a typical instance of good practice in front driving, claiming that vehicles thus designed are non-skidding, and consequently economical with regard to tyres. On this aspect of the question, Dr. Hele Shaw related how a few days before he had seen front-driven vehicles run a straight course over a greasy surface, while rear-driven cars had severe side-slips. The consideration of the relative values of the front and rear principles of driving is of practical importance to the industry, and the efforts of the Institution to secure its discussion by scientific and mechanical experts deserve the encouragement of the industry.

The Quaker City Contest.

RECENTLY an important Endurance Run of the Quaker City Motor Club was held at Philadelphia, when twenty-three leading types of cars participated. Among these was the White steam car, and, as frequently happens in such events, it went through to first place. The particular entrant was Mr. N. K. Sheridan, who ran the "White" the whole of the two days of the test with a clean record. In the end three cars had no marks against them and the judges decided that the trio should cover the course of 173 miles again, but in one day

Mr. H. K. Sheridan on the White Car that was first in the Quaker City Endurance Run.

instead of two. After this had been done the cars were again examined for defects in mechanical parts, the ultimate result being that the White was hailed as the winner.

Widening the Roads.

WRITING to the "Scotsman" with reference to motor traffic, Dr. John Haddon, of Hawick, suggests that one of the great dangers to horse drivers occurs on narrow roads which are often fenced with wire. He suggests that "if County Councils would have the road sweepings, which have been piled up on each side, removed, the original breadth of the road would be available. If that were done there would be enough breadth to make a parapet on one side for pedestrians and a track for equestrians on the other, leaving the road as broad as at present for wheel traffic. That could be done with little, if any, extra expense, and would mitigate the dangers of the traffic." Supplementing this view in a letter to ourselves, Dr. Haddon observes that there can be no doubt if the Scottish roads were made as wide as they were before farmers ceased to be glad to have the sweepings of the roads to put on their land, it would be much safer now that motor-cars are running upon them; but there must be a separate track in time, for without high speed the benefit of the motor-car is very slight, and the

public are down on fast driving on the roads. The widening of the road by the removal of the sweepings would make a great difference and should cost nothing if the farmers knew the value of the stuff, and this is the time to move it, when frost stops farm work. The idea is one that should be considered by those responsible for the maintenance of the public highway. It is certainly true that encroachments on the width of the roadways have been generally made during the last decade, and motorists should oppose any further reduction of the area of the track along which they pursue their way. In some districts, as suggested by our correspondent, this can easily be done at particular seasons of the year, and advantage should be taken of all such opportunities to promote safe and speedy locomotion.

In the Fog.

VIEWS are various with regard to the penetrating powers of acetylene in the fog of which we have recently had many experiences. In London it is said that the peculiar nature of the gloom which has settled over the city so frequently of late has defied the acetylene, but, on the other hand, it is claimed that this means of illumination is most effective in Scotland, where the fogs are apparently of a different nature. A correspondent when travelling from North Berwick to Edinburgh found the road made quite plain even in one of the densest fogs he had ever encountered in northern Britain by means of an acetylene lamp. Now that we have returned to something of the old-fashioned fogs, the point is of interest, and we shall be pleased, as will readers generally, to have the experience of correspondents on the subject.

The Present Controversy.

VERY interesting is the progress of the clubs' decisions with regard to taking sides in the great controversy now going forward, and, according to the latest information of an official character, eight clubs have linked themselves with the R.A.C., eleven with the M.U., and nine others have decided to continue with both organisations through 1908. Under these circumstances the controversy is likely to be continued throughout the year, both the Club and the Union striving to get the support of the latter class of clubs for 1909 and onward. Under such circumstances, and in view of the likelihood of legislation, we would suggest that there is much to be said for the leaders of the movement joining with such organisations as the Manchester Automobile Club that prefers to hope for some amicable understanding being arrived at. The tact and good sense of Mr. C. D. Rose, M.P., and Colonel W. J. Bosworth succeeded in providing a *modus vivendi* between the M.U. and the A.A. Cannot they, with the Hon. Arthur Stanley, Mr. C. H. Dodd, and a few others, secure a truce to the existing dispute? According to the present outlook it can do nothing but harm to the general welfare of the movement, hence both contestants will do well to preserve an attitude of mutual forbearance to each other.

Liability of County Councils.

THIS question of the duty of local authorities is becoming of national importance, and the variations in practice throughout the country are sufficiently serious to warrant the call for the whole question of highway maintenance and administration to be made a national question. More than that, the liability of a County Council for the condition of its roads, as determined in the case we reported a fortnight ago, should arouse the ratepayers to a sense of their own position in the matter, for any delay in adapting the roads to the new traffic may cause expense to the county funds. This was pointed out by Lord Breadalbane at the last meeting of the Highland District Committee of the Perth County Council, who said that, having regard to the experience of the Elgin Council, it would be well if the committee would look into their own position. The chairman replied that the Highland District Committee did not keep defective roads, and seemed to suggest that the matter was

almost beyond their purview. As a matter of fact the Perthshire roads are among the best in the kingdom, but that need not lead to too complacent an attitude; and County Councils should learn wisdom from the experience of less careful neighbours.

The "Evils" of the Motor Traffic.

IN order to carry out the object indicated in its title, the Highways Protection League is preparing a petition to Parliament against "the evils of the motor traffic," and it will probably be sent to Westminster in the early days of the new session. This organisation has become identified with a campaign against the motor-car, and has certainly attracted some attention in the Press; but whether its diatribes are likely to influence Parliament remains to be seen. If the League would associate itself with the movement to safeguard users of the main roads, by the removal of hedgerows which obstruct the view ahead, the rounding of corners that constitute dangers to moving traffic of all descriptions, and to securing the proper construction of roads, in view of the new conditions that have arisen, motorists would gladly aid its endeavours. But, instead of becoming recognised as the exponent of a policy of improvement

findings, but the latter are such as to prove acceptable to fair-minded persons—and certainly they controvert much of the irresponsible writing which was sent to the Press in the guise of "highway protection"—a phrase which is often narrowed to mean merely "the exclusion of the motorist."

Unrolled Stones.

At this season of the year reports frequently come to hand with regard to the unrolled stones which are found on the roadway. In many districts the surveyors rightly insist that repairs shall be made up as quickly as possible so that traffic shall not be impeded nor the life of tyres threatened. Elsewhere, however, a "happy go lucky" plan prevails, with the result that the careful driver has to go on to the footpath. Otherwise he would run great risks in dashing over several yards of loose stones, more or less pointed. And then, should the ubiquitous policeman be about, the motorist of economical mind is promptly summoned for legal disobedience. The matter is one of general importance. The provision of the Act in preventing the motorist from using the footpath was framed in view of the normal condition of the road, but when the local authorities institut-

Mr. E. E. Wagstaff at the wheel of his 28-h.p. Daimler Car which travelled from Sydney, N.S.W., to Melbourne, Victoria, in October last. The photograph from which the illustration is reproduced was taken outside the Europa Hotel, at Europa, Victoria.

of the highways, the League seems to have attained fame on account of its denunciatory attitude towards motor-cars. King Canute was not successful in commanding the waves, and the Highways Protection League will not have better luck in calling upon motor-cars to stop their running.

An Appeal to the Commission.

MR. F. H. CERRITO, who has lately become honorary secretary of the Midland A.C., has made a good start by sending a well-argued reply to the circular of the Warwickshire Highways Protection League to the County Council on the subject of motorists and their cars. He takes up the wise line that both the League and his club may be looked upon as partisan bodies; consequently anything that either may say deserves careful, if not critical, consideration on the part of those who may be called upon to decide as to the points of difference. Fortunately Mr. Cerrito is able to point to an impartial Commission that has had all the contentions *pro* and *con* before it and that has sifted the evidence, examined the witnesses, and given its decision with almost judicial authority. Probably the extremists on both sides would express dissatisfaction with its

quite a new set of circumstances in the form of unrolled metal surely magisterial discretion should prevail!

More Public Services.

THE way in which the railway companies have lately been watching the development of the various public services which have been established at seaside and other resorts indicates that they will enter more largely into this business in the future than has hitherto been the case. We learn that during the past few days one of the leading companies purchased fourteen motor-omnibuses with a view to improving the summer services, and that considerable accession of this class of traffic is likely to be noted during the coming season. It is recognised everywhere that the easy mobility of the motor-vehicle, which requires no specially constructed tracks, has rendered it easily able to supersede the derelict light railway system in some of the counties, while it will prevent money being wasted on the installation of others elsewhere.

THE trustees of the Jefferson Hospital, Philadelphia, U.S.A., have lately acquired an electrical motor ambulance.

THE STANLEY STEAM CAR.

(Concluded from page 1026.)

FIG. 7 illustrates the new glass water level indicator by which the position of the water in the boiler is determined. The water column X is connected with the boiler, top and bottom, so that the water stands at the same level in the column as it is in the boiler A. Connected with the column, about eight or nine inches from the bottom of the boiler, is a casting C, containing a chamber Z, which fills up from the water column. If the water level is above the connection, it will fill with water, but if it is below it will fill with steam. Surrounding this chamber is another chamber Y, through which the feed water is pumped on its way to the boiler through the pipe K. As the water is pumped through the chamber the contents of the inner chamber are cooled off as soon as the water is high enough to cover the connection with the water column. The indicator itself is in the form of a "U" shaped tube E, open at the top and with one side consisting of a glass tube D on the dashboard B. The other side of the "U" tube is of metal and the end of it is sealed, and inserted through the bottom of the inner chamber of the casting C above described, and extending some distance up into it. The glass tube extends several inches higher than the other end of the "U." The latter tube is filled with water so that the sealed end in the chamber is full, the water standing in the glass, when cold, an inch or two from the bottom of the glass. The operation is as follows:—As long as the inner chamber is filled with water, and while the by-pass is closed, the feed water is being pumped through the outer chamber; it will keep the water in the inner chamber comparatively cool, and the water will remain at a low point in the glass. As soon, however, as the water gets

Fig. 7.—The New Glass Water Level Indicator.

will drop again in the glass. Some of the water may evaporate out of the glass, and it is then necessary to add a little to replenish it. Some three inches below the connection on the water column is a pipe leading up through the dashboard, and in the end of which is a pet cock. As long as the water covers this connection the end of the pipe will remain comparatively cool, and if the cock were opened water would flow out. If, however, the water should get below this connection, the pipe would fill with steam, and would be burning hot, and if the pet cock were opened steam would blow off. By means of this, the operator can determine whether or not the water is getting near to the point where the fusible plug would melt. The arrangement is such that when the water is low in the boiler it is high in the glass; and, *vice versa*, when it is high in the boiler it is low in the glass. It should be added, however, that when the car is cold the water will always be low in the glass, whether or not there is any water in the boiler. Consequently, before firing up, one of the pet cocks should be opened, and the throttle valve or syphon valve opened so as to vent the boiler and see if water will flow out of the pet cock. If it will, it indicates that the water in the boiler is above that point, and the fire should not be started until the operator is certain that there is water in the boiler. The great advantage claimed for this device is that it has no moving parts, and that there is practically nothing that can get out of order. G is a pin valve to shut off the steam from the water column X so that the bottom connection into the boiler of this water column may be cleared by opening the pet cock F and blowing water through this.

The vehicles are fitted with either two or four-seated bodies, Fig. 8 depicting the 10-15-h.p. car adapted to carry four persons, the rear seat being adapted to fold up and form a luggage platform when not required. The wheel base is 7 ft. and the track 4 ft. 6 in. We may add that the British agents for the

Fig. 8.—General View of Stanley 10-15-h.p. Steam Car with Folding Rear Seat.

below the connection to this inner chamber, the chamber will fill with steam, and as it surrounds the end of the "U" it will vaporize some of the water in it, and force the water further up in the glass, thus showing that the water level is below this point: whereupon the by-pass should again be closed until the water once more falls down in the glass. Usually when the car is standing, and sometimes when running with the by-pass open, these parts will heat sufficiently to throw the water up in the glass a little. In this case, if the by-pass is closed, and if the water is above the connection, it will immediately cool it off, and the water

Stanley vehicles are Mr. F. Wilkinson, 16, John Dalton Street, Manchester, and Messrs. W. Galloway and Co., Gateshead.

ONE of the numerous results of the Prevention of Corruption Act now visible is to be seen in the following note, printed on the stationery of a provincial firm of carriage builders:—The trade custom of presenting to coachmen and chauffeurs small gratuities as an encouragement to exercise cars is observed by this firm, unless objected to by the customer.

SOME NOTES ON OVERHEATING.

THE senses vary with different people, and this is especially shown by the varying symptoms produced in the more or less fortunate motor owner when his automobile indulges in that eccentricity known as "overheating." A friend of mine always declares that he discovers the complaint by a peculiar smarting of his eyes, but the majority diagnose the disorder by a knocking sound which the engine makes on these occasions; others are not as good diagnosticians and merely appreciate the state of affairs by the engine pulling badly, and still others but when the piston seizes and search has to be made for a single four-legged horse to drag the many-horsed engine home. Well it is if the state of affairs be recognised prior to the last-named condition, so that the ignominy of being drawn by a quadruped may be obviated.

Over-heating causes excessive expansion of the incoming charge, and thus a full one is not admitted; in addition, the excessive heat results in premature ignition, and so the mixture is exploded before it is compressed and there is less force—that is, less power; furthermore, the oil which lubricates, or should lubricate, the liner or inside of the cylinder and the piston rings is burnt up, and so the piston may seize or even

that is the mechanical one in which the oil is forced by a small pump to where it is required, the pipe rarely gets blocked, as there is pressure behind it; as a result, however, of dirt and cold such may occur, or the band that works the pump may slip or break and the pump thus cease working. In the pressure form the tube conveying the exhaust gases may get blocked and thus the oil is not propelled. The sight drips of both forms of lubricator may also need adjustment, the oil of course being thicker in cold than hot weather. In the event of the pump driving belt breaking, a boot lace will in an emergency carry on the work. A patent steel spring belt is made with a protected roller fastening that answers well.

Imperfect water circulation is probably the commonest source of over-heating, especially in engines cooled by a friction-driven pump. The causes are furring of pipes due to hard water; this can be eliminated by only using distilled water, it costs but a few pence a gallon and its use eliminates one source of worry. An air lock may also prevent the water circulating and so the cooling of the cylinders. If the pump works and the water is not delivering, this should be suspected. The treatment is to open the cock at the radiators and so let out the air; if there is no cock there, a water joint must be broken, and after the water is seen to flow remake the joint with a little asbestos

Motoring in Canada.—A Typical Scene near Montreal.

the connecting rod between the piston and crank shaft may break—a catastrophe beyond roadside repair. These troubles may be considered under six headings, the classification being according to the chief causes:—1. Lubrication insufficient, or defective or improper. 2. Water circulation out of order. 3. Ignition improper. 4. Carburettor imperfect, mixture too rich. 5. Compression poor. 6. Excessive load or friction in transmission (such as a broken ball in the bearing of one of the motion shafts in the gear-box) and thus more power being required than the engine can produce. I propose to consider these conditions individually.

The lubricant itself may reach the parts that require its soothing presence, but its quality may be poor, so that it not only becomes too thin but may decompose and form pitch or grit that, in lieu of reducing friction, sets it up. The temperature in the cylinder may be 3,600 deg. F., and at the part to be oiled perhaps only 500 deg. F., still, unless the oil be a mineral one from which the tarry matters have been removed by filtration through animal charcoal at a high temperature, the lubricant will be useless, and then, as a result of the friction, serious trouble results. Again, although the lubricant may be excellent it may not reach its destination. In the Dubrulle form of lubricator,

cardboard. The blocking of pipes may ensue as a result of want of care in putting on new rubber connections; in slipping these over on to the copper piping, the outer portion of the hose may only engage and the inner part be pushed back, thus forming a valve-like obstruction to the passage of the water. The pump friction wheel may, as a result of grease or wet, slip, and so the pump not revolve sufficiently rapidly to force the water round. The vanes of the pump wheel itself may be worn so that proper pockets are not formed to catch and spin the water round. This latter trouble usually means taking the pump to pieces and fitting a new wheel. These causes of worry were fully considered in an article published in the *M.C.J.* of June 15th last. Prior to searching for these morbidities it is as well to make sure that there is water in the tank to be circulated.

With the high tension system of ignition defects are common and account for a good many cases of overheating, loose connections, partly broken wires, imperfect contact at the contact maker, whether it be of the internal or external variety, due to wear of the wipes or the fibre wheel, or the bush of the latter, imperfect contact at the trembler of coils fitted therewith, or of the trembler at the make and break on the non-trembler kind, sooted sparking plugs, broken porcelain, or exhausted

accumulators: one of these is the usual cause. Running the engine in the dark or turning the starting handle with the current switched on will usually reveal a short or an imperfect connection, which, when found, can of course be speedily remedied. If needful, each lead can be separately tested with a battery, and either a voltmeter or an electric bell. All contacts must, of course, be kept clean, especially at the accumulators; here, after polishing the terminals and screwing them on, a little grease should be applied to prevent corrosion. Earthing the plugs on the engine and shorting the contact maker will show plug mischief. The sparking points should be about one-sixteenth of an inch apart, but with run down accumulators they may be approximated a little more. Should the commutator wiper not press evenly on the fibre wheel, they should be adjusted so as to do so, or if the bush of the fibre wheel is worn so that the wheel wobbles, either a new bush should be driven on or a washer fitted so as to keep the fibre wheel square with the two to one shaft on which it is fixed. If the blocks or rollers on the wipers are worn unevenly, new ones are needed, or the old ones can be ground true on an emery wheel. It is as well to carry spare wipers, whether the contact maker be of the internal or external wiper variety, or if it be a make and break. A voltmeter or a four-volt lamp speedily shows if the accumulators are run down; if a spare set is not procurable, by closing the sparking plug points slightly, it is often possible to get the engine to run. If the platinum points on the tremblers are burnt, they should be

An Early Benz Hotel 'Bus.

trued with a fine file and then set so as to give a good buzz. In the high tension magneto the usual trouble is due to dirt at either the platinum points or on the carbon brush to the distributor; if these are occasionally cleaned, and the wires and contacts kept well insulated, trouble from this cause cannot occur. It is well to remember, however, that the magnets need remagnetizing occasionally.

With the present automatic carburettor carbon deposit on the piston or in the combustion head is rather apt to occur, and then a small portion of the deposit may become incandescent and so ignite the mixture prior to compression. A similar deposit may result from the jet in the carburettor wearing, and so making too rich a mixture. The only treatment is to systematically take down the cylinders and clean and scrape them every two or three months if the car is in continuous operation. A flooded carburettor with a blocked overflow hole may rapidly cause this condition; inspection to see that the needle valve is true and that the overflow hole is clear is less trouble than frequent taking down of the cylinders for deposit removal by scraping. Prevention being better than cure, it is as well to set the carburettor so that the engine runs with as much air as possible and to use a reliable lubricant.

Leaky valves or joints are a source of poor compression and thus indirectly of overheating. The constant grinding in of valves is not to be commended, but after a time they may become pitted and then should be taken out, carefully wiped and

ground in. But, before making the valve the bugbear of the trouble, it is as well to make sure that the valve lifters, as a result of the valve seats wearing, are not too long, and thus prevent the valves closing; even if, when cold, they do not do so they may when the parts are hot. There should be just room to pass a sheet of thin paper between the valve stem and lifter when it is down, this will be enough allowance for heat expansion. The inlet valve joints or those at the combustion head may blow, that is, allow gas to pass, either as a result of the nuts holding them in position shaking loose or through the copper asbestos rings wearing. If a little oil is smeared round a suspected joint and the engine pulled round, bubbles will reveal where the defect is, and then, if a new copper asbestos ring is not at hand, a grommet of asbestos cord rubbed up with red lead makes an efficient substitute. Another cause of loss of power is gummed rings due to too much oil blocking the grooves in which the rings should work, opening the compression cocks and pouring in either paraffin or petrol, and then pulling the engine round with the current switched off will clean and thus release the rings.

Excessive friction in transmission may certainly cause overheating; this may be due to want of efficient and sufficient lubrication in the gear-box or bevel bearings or to a broken ball in one of the bearings. The feeling of such of the latter as are accessible will, by the presence of heat, reveal the morbid one. Frequently bearings in the gear-box are oiled by the lubricant in the box itself, and this cold weather this may be too thick to reach them; the addition of a little relatively thin oil to the gear-box will obviate this source of trouble. Want of lubrication of the crank bearings is also a cause. Most cars now have an inspection hole in the crank case, so that the height of the oil there can be seen; in those lubricated by splash it should be so high that the cranks just dip in when pulled round.

To sum up, in cases of overheating it is as well to immediately stop the engine and systematically investigate the diseased state. From experience I suggest the following procedure:—1. See if there is water in the radiator or tank, if so, whether the pump is working and the water circulating; feeling one of the rubber connections will reveal if the water is delivering. Remember that an air lock may hold up the circulation; to treat this open the cock at the radiator, if there is one, if none, break a water joint or connection and so let out the air. 2. See if there is oil in the lubricator; if so, if the lubricator works, whether the pipes are free and that the oil drips. 3. Notice if engine fires regularly; if not, look for loose connection, bad insulation, wipers not pressing evenly on contact-maker, plugs sooted or porcelain broken, accumulators run down or magneto not working. 4. Examine carburettor, see if overflow hole or pipe is blocked, if jet hole worn and too large, if float floats, if needle valve is true. 5. Test compression, to see if the valves or joints leak, and if the piston rings are gummed. If engine fires prematurely the cylinder will want, on first opportunity, removing and the deposit scraped off the piston. 6. Lastly, examine bearings to see if any have fired or are hot as a result of insufficient lubrication, or a broken ball. Attention to these points, if it does not prevent, should anyway help in effecting a cure of overheating.

C. T. W. H.

MR. H. P. MAXIM, a well-known American motor engineer, writes:—"Now that the weather is down close to the freezing point, drivers and owners will doubtless experience more or less trouble in starting their cars, especially if the machine is kept in an unheated stable. I have adopted a method that is both simple and sure, and I have no more difficulty in starting my four-cylinder machine at 10 deg. below zero than I would at 90 deg. in the shade. I take an ordinary household kettle of boiling water and pour it slowly over the carburettor and inlet pipe, and by the time I have used all the water these members are warmed up. To make sure that the cold oil has not insulated the magneto shaft I squirt a drop or two of petrol on it just where it comes out of the bearing. This cuts the oil, and makes sure of a good contact for the earth return in the magneto."

THE NIEUPORT HIGH TENSION MAGNETO.

A NEW high tension magneto, which may be adapted to a motor of any number of cylinders, has lately been introduced by La Société des Allumages Electriques des Moteurs Nieuport, of Suresnes, France. The fields are composed of four U steel magnets held together at their bases by screws and bound over the tops by a brass strip. A peculiar feature is the method of incorporating the pole pieces of the field. As shown in Fig. 1, the pole pieces are directly embedded in a white non-magnetic material, and the whole is then bored out to form the chamber in which the armature revolves. In this

Figs. 1 and 2.—Transverse and Longitudinal Sectional Views of Nieuport Magneto.

way the armature is completely protected from the entrance or accumulation of foreign matter. In the side sectional elevation, Fig. 2, are shown the assembly locations of the parts. The primary and secondary armature windings are indicated by heavy and light lines respectively. The armature core is made of laminated sheet iron and the armature as a whole is mounted on D-W-F ball bearings. The two windings, the condenser and the primary circuit breaker revolve with the armature. The circuit breaker parts, shown at A and B, Fig. 3, are mounted on the rear face of the condenser casing, and the break in the cir-

Fig. 3.—View of Interrupter on Nieuport Magneto.

cuit is caused by the contact of the arm A with either one or the other of the two rollers shown at C, Fig. 2. These rollers are a part of the end casing, and it is at this point that the adjustment of the time of the spark with reference to the armature position is made. The condenser D, placed across the primary break, is enclosed in a sealed casing for its protection. One end of the secondary winding is earthed and the other is led, as shown in Fig. 2, to the grooved insulating

ring which is part of the armature. In the bottom of the groove is located a segment, with which the end of the secondary winding is connected. A spring brush at E conveys the high tension current to a second brush, which contacts a metallic ring set into the insulated rotative member F. The latter is mounted on a plain bronze bearing and is driven by the pinion G on the armature shaft. The disc F in turn carries a spring-pressed brush, which makes contact at the proper time with pole pieces set into the stationary insulating member H, on the upper edge of which are the terminals for connection to the sparking plugs. A piece of glass, I, is arranged at the centre of H for the purpose of making observations of the position of the brush carried by the rotor F. Simplicity and directness in action have been aimed at in the design of the Nieuport magneto, and it is claimed to give an exceptionally good spark at a low rotative speed of the armature.

A NEW CLUTCH.

THE accompanying illustration gives a sectional view of a leather-faced cone clutch which has just been put on the market by Messrs. Acer, Ltd., who are supplying it both for fitting to new chassis, and for improving old cars in which the clutches have hitherto been a source of tribulation to the drivers. It will be noticed that the device is provided with multiple springs, these, indeed, being one of its chief features, and not only enable rapid adjustment when required, but are claimed to give better results in practice than clutches in which only one central spring is provided. No end thrust is possible, for the design nullifies it, as will be gathered from the drawing. Attention is also directed to the large ball race ($5\frac{1}{2}$ in. centres), which takes the pull of the springs in de-clutching, and also to a second ball race

—instead of merely a plain ring—that is attached to the draw links to avoid friction when the clutch is withdrawn. Owing to the short radius at which the arms of the release lever work, only a small pressure is required on the pedal in operating. There is a universal joint installed that increases the facility of dismantling the clutch, besides making accurate alignment or whipping of the frame a matter of comparative indifference. Altogether the "Acer" clutch appears to be a well-thought-out and practical type for, in spite of an increasing fashion for other varieties, it is generally admitted that a well-proportioned leather clutch is indeed hard to beat for simplicity, robustness, durability and low cost of renewal.

A LARGE number of inquiries for pleasure cars are reported to have lately been received from Cuba, Porto Rico, Mexico and South America by a number of New York agents.

MESSRS. WALKER BROS. (Wigan) Ltd., of Pagefield Iron Works, Wigan, are storing and repairing any cars which go their way. Mr. A. J. Drake is in charge of the well-equipped workshop.

MOTORING AS RECREATION.

THE difference between play and work is often a question of temperament. Mr. G. L. Gomme, the clerk to the London County Council, regards "a change of work" as recreation; others might see in the effort to get from one pastime to another a species of work at once irksome and troublesome. We were led to this reflection on glancing through some of the 2,000 pages that constitute "Who's Who."

Although a standard work of reference, this familiar red volume is not without its entertaining side, and in the intervals of technicalities and business cares its pages may be agreeably consulted with regard to the play-times of prominent public men and women. That is the journalist's recreation. To be included in the famous volume issued by Messrs. A. and C. Black is something; for those whose biographies have thus attained authoritative publication must have become famous in some particular work of life. Their recreations are as varied as their pursuits. Mr. George Bernard Shaw, who, by the way, became a motorist at the end of 1907, and has doubtless included a determination not to be caught in a police trap among his good resolutions for 1908, declares his recreation to be "anything but work."

Others take leisure more seriously. Professor Herkomer plumps for automobilism, and Sir J. H. A. Macdonald, whose lettered distinctions occupy several lines, includes motoring in a wide range of enjoyment ranging between volunteering and arbitrating in international football disputes—the latter almost as hazardous as the mountaineering which Sir Martin Conway combines with motor cycling. Signor Marconi associates hunting, cycling, and motoring as his most alluring recreations; and Major Langrishe, who will be remembered by motoring pioneers as one of the venturesome participants in the famous 1,000 mile trial, delights in hunting foxes, yachting and motoring. Mr. Charles Cordingley, who was also a member of the 1900 pilgrimage, is described as taking his pleasures in travelling and motoring—a combination of tastes that has carried him to Algeria for the winter. Sir C. Cameron, Sir T. Dewar, and Mr. E. H. Carlile, M.P., place motoring among their recreations, the latter also confessing to farming as equally delightful. The Rev. R. J. Campbell has twin recreations in horse riding and motoring. One of the curious omissions is with regard to Lord Montagu of Beaulieu, who, if we look upon the absence of motoring for recreation as any indication, takes automobilism so seriously that it is scarcely a pastime. The motor-cycle has some strong adherents, Mrs. Kennard, the novelist, and Mr. Harold Gorst, the son of Sir John Gorst, among them. The favourite summer amusement of the lady novelist is to "go on tour and ride forty or fifty miles a day seeing the country, natives, &c." We may also claim the Hon. Stephen Coleridge as a friend of Motorism, for he takes pleasure in "all manly sports that do not involve cruelty to animals."

Several teachers at colleges and polytechnics describe motoring as among their favourite ways of spending leisure hours, notably Professor Callendar, of the Royal College of Science, Mr. J. S. Lyon, of the Royal College of Science for Ireland, who combines a taste for vocal music with petrol engine building, and Mr. Walter Hibbert, a lecturer at the Regent Street Polytechnic, who has written on electrical ignition for motor vehicles and regards experimental work as a great recreation. The recreation of Mr. J. Hargreaves, M.F.H., whose enthusiasm for motor racing has been a feature of the automobile year in the past is not given, and Dr. H. S. Hele-Shaw might have added motoring to his published pastimes of golf and mountaineering. Among the other items of social information contained in the 1908 "Who's Who," we learn that the New Zealand statesman, the Hon. J. E. Jenkinson, places bowling and motoring as his dual open-air attractions, and that Sir W. G. D. Goff, Bart., goes-a-yachting with as keen enjoyment as he goes-a-motoring.

CONTINENTAL NOTES.

Motor Scouts in France.

Following the example of the Automobile Association in this country, cyclist scouts are being put on the roads in France by the Association Generale Automobile at those points where the police have recently been too assiduous in their attentions to motorists.

Belgian Motor-car Imports and Exports.

The imports of foreign motor-cars and parts into Belgium during last year attained a value of £173,048, as contrasted with only £157,664 in 1906. During the same period the exports of motor-cars and parts from Belgium increased from £376,092 to £440,044.

Public Services in Italy.

A proposal is under consideration to establish a public motor-car service between Verolanuova and Orzinuovi (Brescia). The Italian Minister of Public Works has also received an application for authority to start motor-car services in the provinces of Verona, Brescia, Mantua, Rovigo, Vicenza, and Padua.

State Public Services in Austria.

The second State public motor-car service in Austria has just been opened between Linz and Eferding. The vehicles employed are of 35-h.p., and make the journey of 26 kilometres in 1 h. 40 min. In addition to the mails, both passengers and luggage are carried. It is intended to extend the service at an early date to Feuerbach.

A State Automobile Testing Laboratory.

The Prussian Minister of Education's Budget for 1908 includes a sum of £1,500 for the establishment of a State automobile testing laboratory. In view of the progress of the movement it is intended to devote special attention to the subject of motor-cars at the Technische Hochschule in Berlin, where the amount above mentioned is to be spent in perfecting the equipment of the existing laboratory.

The Exhibition Question in France.

At a meeting of the French Chambre Syndicale de l'Automobile in Paris last week it was decided that the annual Paris Salon should be held in December next as usual. The exhibitors are to be asked to go in for less costly stands than hitherto, but at the same time the organisers are not to relinquish any offer to render the general setting of the exhibition one of elegance and brilliance. An endeavour is also to be made to reduce the number of free entries to the Salon, while the exhibitors at the show shall, it is proposed, share in any profits that may be made.

An Alcohol Motor Competition.

The French Automobile Club, with the co-operation of the Ligue Nationale Contre l'Alcoolisme, is organising a trial of motor-car engines solely using denatured alcohol as fuel. The tests, which will commence on June 1st next at the A.C.F. laboratory at Levallois, will comprise (1), a six hours' run on full load; (2), three hours' running under half load; and (3), an equal period running light. The awards will have regard to (a) the weight and power of the engines in horse-power kilograms, under the best working conditions, and (b), the consumption in litres per horse-power hour, at the maximum power developed. One day will be allowed to the competitors to fix their engines on the testing benches, and a second day for any preliminary trials to see that everything is in order. Entries at £4 per engine are to be sent to the A.C.F., 3, Place de la Concorde, Paris, before the 15th May next.

The A.C.F. Grand Prix Race.

So far fifteen cars have been definitely entered for the A.C.F. 1908 Grand Prix race, viz., three each Germans (Belgium), Benz (Germany), Fiat (Italy), Weigel and Austin (Great Britain). The Sporting Commission of the A.C.F. has decided that even if too large an entry list is secured no elimina-

tion contest shall be held, but that the number of cars per firm shall be cut down to two instead of three. Quite a number of new drivers will, it is expected, be seen at the wheels of cars in the contest, while many of the old brigade will be found driving under fresh colours. Thus Jenatzy is not included in the Mercedes team, which will consist of Messrs. Salzer, W. Poegge and Lautenschlager. Duray, Rougier and Minoia, the latter from the Isotta-Fraschini works, will form the De Dietrich team; Sisz, Caillois and Dimitri that of the Renault Company; the Clement-Bayard team will be made up of Rigal, Gabriel, who has hitherto been with the De Dietrich Company, and Hautvast, the old Pipe driver; while for the Panhard cars the drivers are Heath, Demogeot and Cissac. The first of the trio has driven for the firm before, Demogeot has hitherto been known in connection with Darracq vehicles, while Cissac will be remembered for his series of record-breaking runs on a Peugeot motor-bicycle on Blackpool promenade.

£72 for two, and £100 for three, and at double these rates until June 1st next. Three Isotta-Fraschini and three Gregoires have already been entered for the event. It is stated that the engines of the first-named cars will have four cylinders 62 mm. bore.

Miscellaneous Items.

A COMPANY has just been formed in Dusseldorf with a capital of £5,000 and the title Die Deutsche Elektromobil Gesellschaft "Fram," to acquire and develop the electrical vehicle patents of Sr. E. Cantono, of Rome.—A motor-car exhibition is to be held at Prague, Bohemia, from the 22nd to the 26th March next.—The annual Dutch motor-car exhibition opened in Amsterdam on the 17th inst., and will continue to the 26th inst.—A new anti-freezing compound known as motoglycerol has lately been put on the market by La Société des Huiles de Nanterre, of Nanterre, France.—It is reported that a company has been formed at Janina, Turkey, for the establish-

The French Airship "Ville de Paris," which last week successfully made the journey from Sartrouville to Verdun, a distance of about 135 miles.

Le Grand Prix des Voiturettes.

The French Automobile Club has lost no time in issuing the rules relating to the voiturette race which is to be run the day preceding or following the A.C.F. Grand Prix in July next. The contest will be over a distance of between 350 and 500 kilometres, and be open for cars with engines of a maximum cylinder dimension as follows:—Single-cylinders up to 100 mm. bore, two-cylinders up to 78 mm., three-cylinders up to 68 mm., and four-cylinders up to 62 mm. The cars must weigh, in running order, but not including water, spirit, tools, or spare parts, a minimum of 600 kilog., and must carry not more than two persons side by side. Neither the use of detachable rims nor wheels will be allowed. Firms may each enter three cars, but the A.C.F. reserves the right, in case of an unusually large number of entries, to reduce the number to two. Entries will be received up to February 15th at the rate of £40 for one car,

ment of a public motor-car service between that town and Preveza.—According to a return issued by the Automobile Club de la Sarthe, fifty-nine accidents due to horses took place in that Department of France during the final quarter of 1907, causing the death of ten persons and injuries to fifty-seven others. Motor-cars only caused four accidents during the same period, and from these no deaths resulted, and but four people were injured.—A motor-car exhibition which will run to February 2nd was opened in Turin on the 18th inst.—A number of Brasier 12-15-h.p. four-cylinder taximeter cabs are about to be placed in service in Bordeaux.—Mr. Henry Farman was entertained at a banquet at the A.C.F. club house in Paris on Thursday last week by the French Aero Club, when Messrs. Archdeacon and Deutsch de la Meurthe each presented the intrepid aeronautist with a cheque for £1,000—the prize he won by the successful flight on his aeroplane.

MOTOR TYRE SECURITY BOLTS.

THE Palmer Tyre, Ltd., have drawn our attention to the important question of the number of security bolts which should be employed in connection with motor tyres, and the spacing of them. They inform us that complaints are occasionally received of tubes bursting suddenly while the car has been turning a corner at high speed, and, upon investigating such cases, they have invariably found that the trouble has been entirely due to an insufficient number of bolts being used, or those employed being badly spaced. The valve, contrary to the general opinion, does not fulfil any of the functions of a security bolt. The subject appears to be so little understood by users, or appreciated by car manufacturers, that the Palmer Tyre, Ltd., have prepared the following table showing the correct number and spacing of security bolts for different

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

sizes of wheel and tyre. The particulars given apply to other types in addition to Palmers:—

Size of Tyre in mm.	10-spoke Wheels.				12-spoke Wheels.			
700 by 65	4 bolts as Fig. 1				4 bolts as Fig. 3.			
700 by 75								
750 by 75								
800 by 75								
700 by 90	4 " " 1				4 " " 3.			
760 by 90								
810 by 90								
870 by 90								
910 by 90	5 " " 2				5 " " 4.			
810 by 100								
870 by 100								
815 by 105								
875 by 105	5 " " 2				5 " " 4.			
915 by 105								
820 by 120								
850 by 120								
880 by 120	4 " " 1				5 " " 4.			
920 by 120								
895 by 135								
935 by 135								
	5 " " 2				6 " " 5.			

The 100 mm. tyres, being designed to fit 90 mm. rims, are deeper in proportion to the width of rim than other sizes, and,

therefore, require a larger number of security bolts. It is important that the bolt holes should be drilled exactly central between the edges of the tips of the rims. It is not unusual to find wheels in which the bolt holes are as much as 3-8 in. out of centre; in such cases the bolt only holds the bead of the cover on one side, and there is a risk of the head of the bolt being broken off owing to the unequal strain set up.

EGYPT AND THE HOLY LAND.

N EARLY eight years ago, when planning a tour of the world with his Napier motor-car, the question of a drive in Egypt and the Holy Land was uppermost in the mind of Mr. C. F. Glidden, but at that time very little information could be obtained as regards the condition of the roads for motor-cars in the vicinity of the historic places. Information is now less scanty. During the past five years several hundreds of miles of new roads have been constructed in the Turkish possessions on the eastern shores of the Mediterranean, opening up both Egypt and Syria. To explore these new fields with his car, Mr. Glidden proposes to establish headquarters at Alexandria, Egypt. From this city drives can be made to many places of note. In a western direction, by the aid of the compass, he will venture well out on to the Libyan Desert, beyond the recently discovered city of Abu Mina, over the billiard-table-like surface of the desert, which extends for two hundred kilometres. Branch drives can be made to the coast, and south, further into the interior, to the oases and camps of the nomad tribes. Returning to Alexandria, he can follow up the Nile Delta to Cairo. Cairo is 130 miles from Alexandria, and the drives in Northern Egypt on the desert to the oases, and return journey, ought to total about 500 miles. Drives south and east of Cairo to the Pyramids of Gizeh, thence across the desert to those of Abusir and Sakkara, can also be accomplished. A good road runs from Cairo to Suez.

It would be a hazardous undertaking to drive from Cairo to Jerusalem across the desert, as the Syrian coast is cut up by unbridged streams running down from the mountains, and the trail is principally a pack caravan route, often infested with hostile Kurds, and the sand of the desert in this section of Syria is soft and deep. It will, therefore, be necessary, in order to reach Syria, to ship the car from Egypt to Jaffa, from which place a good road runs to Jerusalem, the Dead Sea, the River Jordan, and other points of interest. To reach Upper Syria the motorists must return to Jaffa and sail to Haifa, motoring from this point over the mountains of Samaria to Nazareth and the Sea of Galilee at Tiberias. Returning, and sailing from Haifa, their next point in Syria will be Beirut. From this place they are assured of a good road to Damascus; across the Syrian desert to the ruined city of Palmyra, and possibly to Babylon and the Euphrates, making a total drive in Syria of 1,500 miles. Carriage now run across the desert, which is smooth and hard from Bagdad to Aleppo, and on this route there have been established post houses with sleeping and dining accommodation.

MESSRS. PACK AND SONS, carriage builders, George Street, Brighton, have lately fitted a handsome limousine-landaulet body to a 35-45-h.p. Renault chassis to the order of Colonel Shaden, of Rushall Beacon.

COL. ERSKINE and the officers of the 3rd V.B. Northumberland Fusiliers have been testing a motor wagon designed by Sir W. G. Armstrong, Whitworth and Co., Ltd., for the conveyance of troops and baggage. The wagon is constructed primarily as a char-a-banc to carry twenty-five troops fully equipped with rifles and ammunition, together with the driver and two officers. Some 10,000 rounds of reserve ammunition, a stretcher, and various tools and appliances have also their apportioned places, and all accessories are amply secured. When the wagon is not required for troop transport it can in the space of a couple of minutes be transformed into a flat lorry with sides, and will take in that form three tons of material.

THE motor-car is being introduced into Bradford.

THE Durham Motor and Engineering Works have a garage opposite South Ealing Station.

MESSRS. RUSSELL AND Co. have a well-appointed garage at Dryad Street, Felsham Road, Putney, S.W., where accommodation is available for twenty large cars.

THE authorities of the Royal Naval Barracks, Portsmouth, have lately acquired a steam motor-wagon for conveying blue-jackets' luggage and stores from the barracks to the Dockyard.

ADDITIONAL premises in Renfield Street, Glasgow, have been acquired by the County Chemical Company, Ltd., of Birmingham. They have now a licence for the storage of ten tons of carbide in Glasgow.

MR. E. RICHARD, who is known to most motorists who visit Brighton, is retiring from the management of the Hotel Metropole in that resort. He has been responsible for the Metropole for the past eighteen years.

A LARGE showroom in Northumberland Street, Newcastle-on-Tyne, has been taken by the Percy Cycle Company. This adjoins their motor garage, and will be the headquarters of their business in the letting of motor-cars on hire.

WITHIN a fortnight of being equipped with motor appliances the new fire station in Trinity Road, Tooting, was the scene of a fire, some petrol having become ignited. The new motor fire-escape and first aid appliance were seriously damaged.

A CANADIAN correspondent reports that there is a promising outlook for the sale of motor-cars in north-west Canada. A number of ranch owners in the Calgary-Edmonton district are now using motor vehicles in connection with their work.

THE Yachting Committee of the Automobile Club of France have worked out the times for the mile and kilometre records established at Evian by the "Lorraine-Dietrich" of M. Perignon, and find them equal to a speed of 55 kilometres 816 metres an hour.

THE value of the motor-cars and parts exported from the United States during the eleven months ending with November last is returned at £1,091,108, as compared with only £833,406 in the corresponding period of 1906. England was responsible for no less than £334,336 of the total, Canada being second on the list with £229,112.

THE Daimler Motor Company have just issued an interesting paper model of their 30-h.p. car. This affords a graphic means of illustrating the construction of this vehicle, and provides an instructive lesson in the anatomy of motor-cars. The Daimler Company would be glad to send a copy of the same to any of our readers who care to apply.

WE learn that Mr. H. Luff-Smith, who has for many years been connected with the Wolseley Tool and Motor Company, is starting on his own account as a motor-car agent at 6, High Street, Shrewsbury, where, in addition to a depot, he will have garage accommodation for a large number of cars. Mr. Luff-Smith has also secured the sole district agency for the Siddeley vehicles.

AT a recent meeting of the executive committee of the American Automobile Association the following definitions were adopted:—An international race is a race where the entrants are respectively named by and represent any two or more of the recognized national affiliated automobile clubs of the world. A national race is a race where the entrants are respectively named by and represent any two or more of the automobile clubs affiliated with the American Automobile Association.

ARGYLLS HAMPSHIRE, LTD., of Castle Road, Southsea, have sent us a sample of a new motor-tyre valve recently devised by a local inventor, Mr. W. Richards. The valve, which is contained in the main body, is a steel ball with spring. Mr. Richards claims that it will fit existing tyres, and that each valve is separately tested up to 300-lb. pressure. Easy inflation is also one of its merits, and it is very positive in action, while another important feature is that there are no loose parts liable to get lost when changing tubes.

HERE AND THERE.

A NEW garage is about to be opened in Westgate Street, Cardiff, by Mr. C. Winsor Bowen.

A NEW motor fire engine is to be obtained for the Preston Circus fire station at Brighton. The chassis is to be purchased

from the proceeds of the sale of disused appliances, and the body is to be built by the firemen.

UNDER the title of the Kraftfahrer Vereinigung Deutscher Aertzte, a society of German doctors who use motor-cars has just been formed in Berlin.

THE Weldless Steel Tube Company, Ltd., of Icknield Park Road, Birmingham, send a list of their motor tubes, and also a calendar in which art and industry are well combined.

THE Great Western Railway intend starting a motor-car service in May next between St. Clears Station and Pendine, passing through Laugharne, which will be the headquarters of the service.

ONE of the conditions which the Watch Committee of Sheffield have insisted upon in granting a licence for the motor-car in that town is that there is to be no "undercutting" of horsed cab fares.

THE Couple-Gear Freight Wheel Company, of Grand Rapids, U.S.A., has secured an order from the U.S.A. War Department for the construction of a heavy motor-wagon for use in the field service of the American army.

IN connection with the article entitled "Some Notes on Induction Pipes," published in the M.C.J. of the 14th ult., the

accompanying illustration, taken from the "Motor Age," is interesting as showing the arrangement of inlet pipes adopted by the designers of several American six-cylinder cars.

MR. W. T. LORD has arrived at Calcutta from Bombay on his Argyll car which ran over 2,000 miles, according to Smith's milometer, about 300 of which were spent in giving various interested persons in various places short trials. The journey by road from Bombay to Calcutta, via Agra, is approximately 1,700 miles. The actual time spent on the road was 77½ hours, including odd runs, the average speed being 25·69 miles per hour.

AS a special accommodation to passengers from the U.S.A. who wish to use their own automobiles in touring abroad, the North German Lloyd Steamship Company have arranged to carry motor-cars, going over and returning to Europe, at a comparatively low cost. Under the new conditions passengers may ship their automobiles on steamships sailing from New York on Thursdays, and by taking the express steamships sailing on the following Tuesdays find their cars waiting for them at Plymouth, Cherbourg, or Bremen.

A COPY of the Automobiltechnischer Kalender and Handbuch der Automobil Industrie for 1908 is just to hand from Herr M. Krayn's Verlag, Berlin, W. This is the fifth year of publication, and this work, while specially intended for use in Germany, will be found to contain much useful information for motor engineers in this country. The various components of motor-cars are described and illustrated, as also are accessories, the up-to-date character of the book being indicated by the inclusion of the new Bosch low-tension sparking plug and the 1908 models of several German motor-car firms.

THE question of widening the well-known Lion Bridge, Alnwick, is being discussed locally.

THE Canterbury (New Zealand) Automobile Association has held a South Island Reliability Trial.

A NEW motor-bus service has been commenced from Willesden to Victoria Station, W., via Kilburn High Road.

MR. A. DIGNASSE has arrived in Bombay with the 35-h.p. Sunbeam, for which Messrs. Hill, Sawyer and Co., of that city, are agents.

THE London Road Car Company is about to dispose of stabling and other premises which, between them, accommodate about 800 horses.

BETWEEN forty and fifty motor-cars have taken part in a P.S.A. motor meet organised by Mr. Harry Tate from the Midland Hotel, Manchester.

THE Shamrock Cycle Company, of Brunswick Street, Dublin, have installed plant for gear-cutting and also for case-hardening—a fact of importance to motor repairers in the Emerald Isle.

FROM Messrs. H. Coltman and Sons, of the Midland Iron-works, comes a neat catalogue giving illustrations and particulars of the new 20-h.p. car they have lately placed on the market. We hope to refer to this in a later issue.

THE C. F. Weeber Manufacturing Company, of Albany, U.S.A., have recently introduced the tool illustrated herewith to facilitate the removal of exhaust valves from petrol motors. As will be seen, the tool consists of a flat steel bar A, which is so shaped that one end of it rests on top of the exhaust valve, while the other is provided with a series of holes in which cotter pins can be placed, which act as pivots for the lever B. A sliding

collar C acts as a pawl in conjunction with the ratchet arrangement D, which is integral with the lever B. The inner end of the lever is forked so that it can be placed under the valve spring retaining washer. A slight pressure on the outer end of the lever forces the spring upward, at the same time pulling down on the bar A and holding the valve against lifting. The collar and ratchet retain the advantage gained and keep the spring compressed, so that the valve key at E can be easily removed.

THE catalogue for 1908 of the Royal Starling and Imperial Starling cars of the Star Cycle Company, Ltd., of Wolverhampton, comes to hand in a form easily accessible for reference, the specification and illustration of both vehicles giving prospective motorists a good idea of the leading features of these moderately-priced cars.

THE Motor House send a copy of their Car Review and Register, in which we notice that nearly 300 vehicles are offered for sale. Not only are the specifications given, but illustrations add to the effectiveness of this list, which indicates considerable activity as well as enterprise on the part of the great establishment in Euston Road, N.W.

A CERTIFICATE has been issued by the R.A.C. with reference to the 484 mile run of a 12-14-h.p. four-cylinder Krieger petrol-electric cab entered for official observation by Mr. F. Combemale. The average daily mileage was 69; the petrol consumption was $33\frac{1}{2}$ gallons, showing an average of .0414 gals. per ton mile, the average ton miles per gallon as 24.12, and the average car miles per gallon as 10.44.

MESSRS. PRYCE CROW, LTD., are carrying out motor repairs at their works, 55, Oxford Street, Swansea.

A MOVEMENT is being projected in Cornwall to present the Bishop of Truro, Dr. C. W. Stubbs, with a motor-car.

COLONEL W. J. BOSWORTH suggests that the pageant which is to be organised in London this year should be held at the Crystal Palace.

THE West Ham Corporation is about to instal a motor ambulance in its fever hospital at Plaistow. Estimates are to be obtained for a 10-12-h.p. chassis.

LORD AND LADY TALBOT OF MALAHIDE have placed an order with the Wolseley Company for a standard four-cylinder 18-h.p. Siddeley car, to be equipped with a limousine landaulet body.

THE chief item in the programme at a Brixton music hall, on Monday, was the appearance of the Countess Randow, a Russian lady, who allowed a 36-h.p. Argyll car (which, with the occupants seated in it, weighed nearly two tons) to run over her ungloved hand, then her foot, and eventually across her body.

A FIRE occurred recently at the Cleveland Car Company's fine new garage at Darlington. Fortunately the building had been installed with the Pearson Automatic Fire Alarm, which immediately notified the outbreak to the Darlington Fire Brigade, who were on the spot within three minutes of receiving the alarm. The fire was quickly extinguished.

ANXIOUS to make himself affable, a young man at a gathering in the suburbs started a conversation with an old gentleman of choleric appearance, who happens, according to the "Daily News," to be a magistrate in a certain district in Surrey. The old gentleman complained of the "bus delays owing to the strike, and the young man remarked "You should try an automobile." "I prefer to try those who do," replied the magistrate testily.

INSTEAD of attempting to depict by printer's ink the colours which purchasers may nominate for their cars, the Locomobile Company of America is issuing a supplement to its catalogue in the form of a colour sample card. This bears twelve stripes finished with the actual colours as used on the cars, including four shades of red, four greens, two blues, a grey, and a striped yellow. In addition to giving the true colours, the card has a further value, according to the Locomobile Company, in that it "tends to limit the customer's ambitions to combinations which have been found to be in good taste and to colours that have been proved sensible, thoroughly practical, and durable."

A DISPUTE has occurred between the Hambledon District Council and the National Trust for Places of Historic Interest, with regard to the use of Hindhead Common. Hindhead is 897 feet above the level of the sea, and the Hambledon District Council has been in the habit for many years of using stone from Hindhead Common for the maintenance of its main roads. Now the Trust, in the exercise of its new powers, is seeking to restrain the Council from the indiscriminate digging of stone on the common. Its main objection to the Council's action is that the appearance of the locality is spoiled by the holes that are dug and the heaps of debris that are left lying about. The Council, on the other hand, asserts its right to continue to use the Hindhead Common stone for its roads, as it did long before the common was acquired for the Trust.

THE Automobile Club of America has recently installed at its premises in New York a dynamometer for the purpose of testing the power delivered at the driving wheels of cars, so that an accurate estimate of the efficiency, hill-climbing power, and speed can be obtained. This instrument, the dynamometric portion of which is of the absorption type, is the invention of Dr. Schuyler S. Wheeler, and gives direct readings for drawbar pull, maximum gradient taken, speed in miles or kilometres, and horse-power. No calculations are necessary to determine results, the required figures being read off instantly from a very large chart fixed on the wall of the testing room, wherein are shown curves that have been arrived at after a long series of mathematical calculations and practical tests. The dynamometer is installed at the ceiling of the seventh floor, while the chart room and rollers are on the eighth.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE SETTING OF VALVES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note several of your correspondents have written and seem to be very interested on the subject of timing petrol engines. During a great many years I have made a special study of the timing of inlet and exhaust valves, also the ignition, and in trying to find out the different methods used by makers for what we may call the "lead" given to the above. My experience tells me that the majority of engines are not set relatively exact one to the other, that is to say, No. 1 cylinder may have a certain lead, No. 2 has got the same as No. 1, and possibly No. 3 has not got the same as No. 2, and No. 4 is probably a little different to the others.

I have made a speciality in my works of the resetting and timing of the exhaust inlet, also for the magneto and accumulator ignition, and I have found in the majority of cases that one can very soon increase the power of an engine if it is set mechanically right. After an engine has had a certain amount of wear it invariably (and almost without exception) gets wrong, and unless it is adjusted by someone who understands it, the engine does not pull as it should. The continual tapping of the tappet lifters in many cases prevents the valve from opening enough, especially in the case where the inlet valve is mechanically operated, and consequently the cylinder does not get enough mixture. One can very often test this by the simple method of putting the thin blade of a knife between the lifters and their valves, and invariably the engine will pick up speed, showing the difference it makes. Also the cams on the half time shaft get worn and the valves open and shut too early or too late, according to the way and the amount they are worn. This also destroys to an enormous extent the power of the engine, and the only way to put this right is to have the engine and timing properly seen to every few months by someone who understands it, and then, and only then, will the engine give off its full power.

I notice some of your correspondents recommend the Larrad timer. In using this I should advise them, if possible, not to use it in connection with the clutch, because there is usually a certain amount of play between the male part of the clutch and the engine, hence it does not register exactly right.—Yours truly,

W. G. WINDHAM, Capt.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With further reference to this interesting question, the letter from "Amateur" is of interest, though it does not get over the difficulty. I believe that the device he mentions is a good one, though I fail to see how the manufacturer or inventor of it can claim that it is absolutely accurate; it is simply the old story of "I'm right, and you're wrong."

I am convinced from practical experience that not only should high and low speed engines have different settings, but, given two engines of the same make and exactly alike in every particular, one will sometimes be found to run better and give off its power with different timing of the valves to the other. Now, if a fixed standard was adopted for this engine, as "Amateur" would seem to suggest, by the use of such an instrument as he mentions, there is no doubt in my mind that both engines would not be timed to the best advantage. There surely should be no difficulty about the cams in a modern machine shop; in several I have visited, both in England and on the Continent, the cams (solid with the shaft) are tested through a gauge for shape to 1-2,000th of an inch, and against a kind of lifter, similar to the ordinary roller and tappet, for lift, this lifter actuating a pointer reading to 1-2,000th of an inch.—Yours truly,

INTERESTED ENQUIRER.

DRY BATTERIES FOR IGNITION PURPOSES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Noticing Mr. L. Bentley's inquiry with respect to efficiency of dry batteries, my advice as a motorist of long standing is, most emphatically, have nothing to do with them, they cannot be relied upon, and give no warning of a run down; a dry battery may run you fairly well to-day, but to-morrow you may be "held up."

It is not the first trouble of an accumulator that renders them uncertain and troublesome so much as the continuous risks incurred consequent upon sending them to be charged. I have overcome all my difficulties by charging my own, and for some time I have used a parallel set of Boron primary batteries; they have given me every satisfaction, and I would not be without them. If Mr. Bentley procures for himself a set of these cells, he will be able to keep his accumulators in perfect condition, which will serve him far better than any dry battery.—Yours truly,

C. COLLIN.

ELECTRIC VULCANIZERS AND ACCUMULATORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—On page 1,030 of the Journal for January 18th you publish a word of warning re electric vulcanizers from the United Motor Industries which we cannot agree with, as the Hay electric vulcanizer manufactured by us gives perfectly satisfactory results with any first

class accumulator of 30 amp. capacity, and we have not felt the need of a special cell to do the work.

During the last Olympia Exhibition the demonstration of the vulcanizer was carried on with 30 amp. cells, and these at the end of the show were in perfect condition, and are now in use at our London depot still doing good work.

Any motorist having small accumulators should put them in parallel, and thus increase his amp. hour capacity without raising the voltage.—Yours truly,

THE COUNTY CHEMICAL COMPANY, LTD.
Motor Dept.

WHAT TOWNS NEED GARAGES?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—If any of your readers will give advice on the following point I shall esteem it a very great favour. I am an engineer, having served my apprenticeship in loco works, and, in addition, had a successful college course. I have spent some months recently working in a motor repair shop and besides have been making a study of motor-cars for the last few years.

It is my intention to start a garage and repair shop somewhere in the country. I shall have one or two cars for hiring and complete plant necessary for all repairs and complete overhauls.

Mr. Henry Farman, who last week travelled a distance of a kilometre on his aeroplane.

From a Caricature by Mich

[in the "Auto."]

My object in writing this is to ask if any of your readers can advise me as to the best part of the country to go to. It must be a place without a great deal of competition to begin with, as my capital being limited, I cannot afford to wait long for business.

I have been strongly advised to try Devonshire, because of the large population of wealthy people resident in the surrounding district. I am rather afraid that such a county will be very well catered for already.

If Devonshire is not advised, will someone tell me a good place in which to start a high-class repair shop, conducted on strictly engineering lines. I may mention that I do not fear competition from ironmongers, plumbers, tinsmiths, &c.—Yours truly,

L. S. M.

SOME DESIRABLE FEATURES ON CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In spite of the fact that we are now in 1908, and many of the 1908 models have made their appearance, there are, I venture to think, many of them which are wanting in some very desirable features. Consider first of all the petrol tap. Even now we find it hidden away in some very awkward place; this may not strike some people as being a very bad feature, but it is, as it is really most important to have this tap accessible, as, in the event of the carburettor for any reason catching fire (which does occasionally happen), the petrol tap should be immediately turned off, otherwise a large conflagration may result. Then there is the petrol gauge. How many

1908 cars are supplied with this very useful refinement? The manufacturers think nothing of putting quite a nice gauge glass for the lubricating oil tank, but the petrol tank is very rarely so supplied, and consequently any attempts at checking fuel consumption are attended with a good deal of trouble and calculation, which a graduated gauge would render entirely unnecessary.

Another point. Is the circulation pump altogether desirable? They certainly are not so troublesome as they were a few years ago, but then they are a source of trouble, and surely it is better to omit them, if possible, and the experiences of Renault and Minerva and others in this direction appear to conclusively prove that a pump is unnecessary.

Now for a lubrication refinement. It probably sounds strange, but it is nevertheless true, that of the 1908 models shown at Olympia there were far more cars with the sight-feeds unmarked than those with them marked! In one case there was a 1908 model with them unmarked, while the 1907 were marked! With six or seven sight-feeds to attend to, and sometimes several more, it is most necessary to know where they feed to, as otherwise one gets careless and runs them all about the same, with the probable result of flooding the back axle with oil, which eventually gets on the tyres and ruins them.

There are other little affairs which might be mentioned, such as accurate marking of the flywheel for valve and ignition setting—rarely found on any car; proper tools in the kit for fitting the various parts; a tool for lifting valve springs so as to easily withdraw the cotter, and many other little refinements which would take too long to enumerate, but the above-mentioned are certainly worthy of the manufacturers' consideration for the 1909 models.—Yours truly,

S. R. B.

A Public Motor Service in Roumania.—The Scheibler Single-Deck Bus which recently started running between Bucharest and Baltatesti.

A STANDARD NOMENCLATURE FOR STEERING GEAR PARTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to suggest that the Institution of Automobile Engineers would be doing a good and useful work were it to devote some attention to the giving of definite names to the various levers, bars, &c., which go to form the steering mechanism of a modern motor-car. At present considerable confusion exists owing to this want of a standard nomenclature. If the Institution were to agree on such a scheme and issue a sheet giving an illustration of the various parts and the names decided upon, they would be quickly adopted by both manufacturers and users and prove extremely useful.—Yours truly,

R. J. BRADLEY.

A CARBURETTOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 10-12-h.p. Alldays car purchased in July, 1907, which is causing me a great amount of trouble, and I shall be glad if you will advise me as to the remedy. My difficulty is that I cannot get a proper (or an even) mixture for each cylinder, as there are two petrol jets and no proper air control. The two automatic air valves require re-adjustment for every change of temperature, and, although the car runs magnificently when everything is just right, I cannot depend on it from one hour to another.

I have proved the coil to be all right by putting it on a heavy delivery van for a week's work with full loads up hills. Would it be advisable to fix up an ordinary carburettor with one spray and proper air control?

I may also add that when I run the engine free it goes quite well and each cylinder fires regularly without any missing, but when I get on the road and put it to work on a moderate rise, and with the throttle well open, one of the cylinders commences to misfire. Please advise me as to the best method of dealing with this trouble.—Yours truly,

"O 2916."

[The fact of this carburettor having two jets and two automatic extra air valves should not prevent a perfectly satisfactory result being obtained. Besides the two automatic spring controlled valves, which are situated on the inlet pipes, between the mixing chambers and the cylinders, there is, we believe, a pipe which provides the main air supply around and under the jets, and this pipe is common to both. We suggest that if there is not a means of controlling this main air supply already installed, it will be as well to have one fitted, so that it can be worked by the driver by means of a small lever, say on the dash, or else on the steering column. This is not an expensive arrangement, and will probably get "O 2916" out of his trouble with the carburation. It occurs to us that it will be just as well to also examine the commutator, as, although the coil has been proved all right, it is just possible that the contacts are worn on the commutator, and that the roller jumps them when the motor is running full speed with the throttle open.]

A LUBRICATION DIFFICULTY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you make a suggestion what is the cause and how to remedy it, viz.:—One of the feeds on my Rover car suddenly stops dripping, and after I have shut off the oil from the drips for a second or two it commences to drip again, and then after a short time refuses to drip. I shall be much obliged if any of your readers can help me.—Yours truly,

DRIP.

[We think the erratic behaviour of our correspondent's lubricator is to be attributed to nothing more mysterious than the presence of some foreign substance, that will probably be found in the upper portion of the lubricator. We recommend him to disconnect the supply pipes and take out the needle valves, and to thoroughly rinse out the lubricator with paraffin. Owing to the small passage through which the oil has to feed, when it is set to pass the needle valves at the rate of only a few drops per minute, it takes but a very small obstruction to interfere with its flow, and if the substance is of about the same weight as the oil it will jog up and down, sometimes allowing oil to pass and at others arresting its passage.]

ACCUMULATOR QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad of any assistance you can give me in the following matter. My accumulator runs down more quickly than it did. I have used it for eighteen months without change of acid. How often is it advisable to change it, and what is the best specific gravity? What injury, if any, is done by neglecting to change the acid? The accumulator is placed just above and behind the cylinder under the bonnet. Does the heat tend to make the water evaporate and the acid to become stronger? I have, as occasion required, filled up the loss with one of strong acid to six of water. Is this about right? Does the rate at which the trembler buzzes have any effect upon the force or completeness of the explosion in the cylinder?—Yours truly,

A. J. ELLIS.

[It is advisable to change the acid in an accumulator at least every twelve months, or more often if it has been recharged frequently. The proper specific gravity for new acid added to cells is 1.190 degrees, and after charging this rises to 1.200 or more. By neglecting to change the acid no injury is done to the accumulator, but it will not give such good results in use, the voltage will be low and it is more likely to sulphate. An accumulator should for preference be placed in as cool a position as convenient, but being close to heated parts would not cause any appreciable evaporation, though this will always require attention, as acid is lost by spilling, by gassing when on charge, and by evaporation to a certain degree. When the liquid is lost by spilling it should be replaced by fresh acid of the right specific gravity, but if it is lost by gassing or evaporation it may only require the addition of a little distilled water to avoid the acid in the cells getting too strong. This can only be settled by testing the strength of acid with a hydrometer. The rate of vibration of the trembler increases or decreases the strength of the spark, and a good hot spark at the proper moment is always a factor which makes for efficiency, but it may not have an absolute effect if a good spark is already obtained at a slower rate.]

THE A.C.F. GRAND PRIX RACE.—We have received from Mr. S. F. Edge copies of a correspondence he has had with the Secretary of the R.A.C. with regard to the rules just issued by the A.C.F. regarding the 1908 Grand Prix race. Mr. Edge takes exception to Rule 17, which authorises the use of interchangeable rims but forbids the employment of detachable wheels and adds that "if such a legitimate contrivance as our detachable wheel be barred from their race it is impossible to enter any Napier cars for the Grand Prix."

OIL v. WATER FOR PETROL ENGINE COOLING.

WE have been furnished with particulars of some tests on motor-car radiators with water and oil as the cylinder cooling medium recently made by Mr. H. B. MacFarland, M.M.E., professor of applied mechanics and thermo-dynamics at the Armour Institute, Chicago, at the works of Messrs. Knight and Kilbourne, Chicago, in the interest of the Owen Thomas Motor Company. The tests were made, first, to determine the effectiveness of different surfaces and velocities of air and liquid with both water and oil, under similar conditions; and, second, to compare the efficiency of the Owen Thomas oil cooling system with water cooling in the same engine. Oil cooling has been used as the cooling medium on an American built petrol motor traction engine for a number of years, but the Owen Thomas is claimed to be the first motor-car specially designed to use an oil cooling system. We are informed that complete specific heat and other physical tests of the oil were made for the company by Prof. C. M. Wilcox and Mr. Virgil Oldberg, also of the Armour Institute, to obtain the preliminary data upon which the oil cooling system was based.

In conducting the tests care was taken to conform closely to automobile conditions. Each trial lasted for several hours, and the whole series extended over three weeks. In all thirty-five separate tests were made. In order to get the same effect of air impact on the radiator as when a car is running at various speeds, a current of air was forced against the radiator by means of a blower, direct connected to an electric motor, with a rheostat arranged to give air velocities of from five to forty miles per hour. The water was pumped through the cylinder jackets in the usual way, and the weight of water pumped per minute ascertained, as well as the temperature of the water on entering and leaving the radiator. The velocities and temperatures of the air at the front and the back of the radiator were measured, and the actual horse power developed by the motor was determined by means of a Prony brake. Pipe connections were made from the top of the radiator to a petrol engine which was used to heat the water or oil, and from the bottom of the radiator connection was made to either of two weighing tanks.

Using water in the jackets, four types of radiators were tested under the same series of velocity and temperature conditions. The radiators varied greatly in total radiating surface and in their proportion of wetted radiating surface to extended radiating surface. Radiators Nos. 1 and 2 were alike, except that in No. 1 the extended surfaces were sweated on by dipping the radiator into a hot solder bath, while in No. 2 the surfaces merely had close mechanical contact. No. 1 proved to be 10 per cent. more efficient, owing to this difference in construction. The following table shows the performance of the four radiators:—

Radiator No.	Heat Dissipated (Heat Units).	Temperature Drop (Degrees).
1	593	25.4
2	536	21.7
3	727	28
4	950	32.2

Comparisons of the results obtained with radiators composed entirely of wetted surface with those obtained from radiators having a large proportion of extended surface indicated that the heat dissipated by the extended surface is but a small percentage of that dissipated by the wetted surface, and that in most radiators the extended surface could be materially decreased with little or no decrease in the cooling effect. Increasing the initial temperature of the cooling water entering the radiator not only greatly increased the initial efficiency of the engine but also the dissipating effect of the radiator. It was found that increasing the air velocity in front of the radiators from ten to fifteen and then to thirty miles per hour produced very little increase in cooling effect, and in the velocity of the air at the back of the radiators. The temperature of the air at the last-named point was generally low and indicated that the depth from front to back could be increased with advantage.

In the test the radiators were plugged to prevent loss by evaporation, and the temperature of the water was carefully kept below the boiling point. Whenever much power was taken from the engine the temperature rose quickly, and it was possible only to run for short periods under these conditions. This point did not appear when oil was used, as the boiling point of oil is about twice that of water.

When oil was passed through the radiator instead of water the results were entirely different. In fact, the radiator giving the poorest results with water gave the best results with oil. A careful study of the circulation in different types of radiators and of the thermal properties and capacities of oil and water soon made it evident that the conditions of circulation for the two were far different.

The complete results of the test with oil-cooling will be made public at a future date, together with the tests of the motor designed especially for oil-cooling. The conditions imposed by the piping connections and jacket details of the motor designed for water cooling did not permit the test with oil to be carried to the limit, but, as a matter of fact, the motor in question did better with oil than with water after the best conditions of oil circulation were determined. A good comparison of the

result obtained with the two fluids respectively is furnished by the last test of one radiator. These results were as follows:—

Fluid.	Heat Dissipated (Heat Units).	Temperature Drop. (Degrees).
Oil	700	12
Water	490	25

Another radiator gave the same cooling effect with a temperature drop of 40 deg. for water and 18 deg. for oil. All the radiators used were standard makes, designed for use with water. Mr. McFarland concludes that the tests indicate that the best radiators using oil on this system are 50 per cent. more effective than when using water under ordinary conditions. The engine also can be made more efficient, because oil can be used at a much higher temperature than water without boiling. An indirect advantage of the oil cooling system is claimed to be a decrease in the mechanical losses of the engine with an increase in temperature. The following table of friction losses in a 40-h.p. engine at different water jacket temperatures is given to substantiate this claim:—

Temperature of water from jacket...	69° F.	150° F.	185° F.	203° F.
Loss on horse power	7.1	5.5	5.0	4.5
Mechanical efficiency	85 %	88 %	89 %	90 %

ROAD REPORTS.

AYRSHIRE.—The Ayrshire County Council have decided to make application to the Secretary of State for Scotland to restrict the speed

Touring in Holland.—The Exchange, Amsterdam.

of motor-cars passing through the villages of High Fenwick and Minisham to ten miles an hour.

BOSTON.—Nearly all the roads in this district of Lincolnshire are under repair, and at the present time are in bad condition owing to the frost. It will probably be another six weeks before they are anything like in proper condition for motoring. No work will be carried out on the roads through the town. Caution signs have been erected throughout the district and should be observed, and Mr. G. E. Clarke, the Borough Surveyor, draws our attention to the railway crossing on the main road from Grantham and Sleaford, about one mile before entering the town. The rails there are super-elevated and adjoin a hog-backed bridge, which is very bad on the springs.

HAMPSHIRE.—The "Hampshire Chronicle" is one of the few papers that give regular reports as to the roads which are under repair in the district. It will probably be another six weeks before they are anything like in proper condition for motoring. No work will be carried out on the roads through the town. Caution signs have been erected throughout the district and should be observed, and Mr. G. E. Clarke, the Borough Surveyor, draws our attention to the railway crossing on the main road from Grantham and Sleaford, about one mile before entering the town. The rails there are super-elevated and adjoin a hog-backed bridge, which is very bad on the springs.

HAWICK.—Mr. W. Graham, road surveyor, has submitted an elaborate report to the Hawick Council on the conference of Scottish road surveyors, held in Glasgow, when the question of motor-car traffic on the roads was discussed. He remarked that the ratepayers in that district had as serious a task before them as any other district in Scotland. While the life of road metal used to be from eight to nine years, it was now from three to four years at some places.

HORSHAM.—The sharp corner where King's and Wimblehurst roads at Horsham meet is to be removed with a view to minimising the risks to traffic.

THE Lancashire Steam Motor Company, of Leyland, near Preston, has changed its title to Leyland Motors, Ltd. For several years past the company has been building petrol as well as steam vehicles, so that its old title was somewhat of a misnomer.

CLUBS AND ASSOCIATIONS.

NOTTINGHAM.

THE eighth annual dinner of the Nottinghamshire Automobile Club, which was held at the Victoria Station Hotel, Nottingham, on Friday last week, proved a very enjoyable and interesting function. Mr. Chas. Hardy, the president of the club, was in the chair, and about 200 ladies and gentlemen attended, including the Mayor of Nottingham (Councillor J. T. Spalding), the Sheriff (Councillor W. H. Carey), Mr. A. Richardson, M.P., the Chief Constable (Mr. P. S. Clay), Colonel H. C. L. Holden, R.A., F.R.S., Col. Bosworth, Captain R. K. Bagnall-Wild, R.E., Dr. Hogarth, and Messrs. A. Barlow, E. P. Hooley, A. R. Atkey (vice-chairman), Julian Orde, Stenson Cooke, E. M. C. Instone, P. Richardson, H. Bircumshaw, M. Ross Browne, and Booth Granger (hon. secretary).

Following the loyal toasts, Mr. A. Barlow proposed "The City and County Authorities," stating that motorists owed a great deal in the favoured and enlightened city of Nottingham to the authorities, and they felt very sorry indeed for those unfortunate people who happened to drive motor-cars in such benighted counties as Sussex and Surrey. They could assure Col. Bosworth that they had no need for his assistance in Nottinghamshire, for the authorities had always done their best for motorists. The Nottinghamshire Club had always endeavoured to see that the members should use the roads in a considerate manner, and if any member of the club was proved upon clear evidence to have used the roads badly, he would meet with very short shrift at the hands of the committee. The Mayor (Councillor J. T. Spalding) in responding stated that in Nottingham there was no bye-law to interfere with the speed of motorists. They relied on the common sense of those who drove cars. They must recognise that motors had come to stay, and they could not stand against the advance of science. Mr. R. B. Bagnall-Wild, J.P., and Mr. P. S. Clay (the Chief Constable) also acknowledged the compliment. Mr. Bagnall-Wild remarked that magistrates had only one thing in view—the safety of the public; while Mr. Clay's speech was in his usual humorous after-dinner vein and showed a friendliness to automobilism which was greatly appreciated. He stated that during the past year the police had had no trouble from motorists in Nottingham.

The toast of "The Royal Automobile Club" was submitted by Mr. A. R. Atkey, who congratulated the parent organisation upon gaining its title of "Royal" since they last met. Colonel Holden, who first replied, said that the Royal Automobile Club was not merely a social institution. Its duties on the one hand were to the public, the larger body, and on the other hand to the manufacturers and the users of automobiles. The motor industry, both for the purposes of pleasure and commerce, would not have advanced as it had done but for the work of the various automobile clubs of the country. Mr. J. W. Orde, the secretary of the R.A.C., also responded. They had entered, he said, on a new phase of automobile politics, and the Notts Club had been the first to back them up. When this body was formed in 1900 by Mr. Atkey and a few other stalwarts, it almost immediately affiliated itself with the Royal Automobile Club. Referring to the differences between the Motor Union and the Royal Automobile Club, Mr. Orde said the latter had now 3,300 members. The Notts, Irish, Kent, Midland, Norfolk, Northampton, Wolverhampton, and Ladies' Clubs had notified them of their intention to associate themselves with the R.A.C., and these represented 1,757 members. The Auto-cycle Union, which included the Auto-cycle Club and thirty-two other clubs, had also sent in their notice that they would become affiliated, and these represented a further membership of 2,000. The Scottish Automobile Club were to hold their meeting on the 24th inst., and he was informed that it was their intention to associate themselves with the club, and this would bring them another 1,000 members. The total membership of the Royal Automobile Club and its associates would then be 8,636. So far as he knew, the clubs which had sent in their adherence to the Motor Union were Ipswich, Lincolnshire, North Hertfordshire, Sussex, and the Welsh, with a total of 607 members. Four clubs—Bedfordshire, Harrogate, Shropshire, and Yorkshire, with a total of 579—had notified their intention of remaining under their existing agreements. There were, however, 120 clubs in the country, so that they had only heard from a very small percentage; but, with the lead that the Notts Club and the others had given, there was no doubt that the majority of the clubs of the country would decide to associate themselves with the Royal Automobile Club.

Mr. Booth Granger, the hon. secretary of the Notts A.C., in proposing "The Motor Union and the Automobile Association," said that, although they had separated themselves from the Motor Union, they still hoped to be friends. The Motor Union, he understood, had decided to form a Notts Committee and the Notts Club certainly wished them every success in their endeavours. The Automobile Association had done splendid service to motorists throughout the country, but they hoped their methods would never be required near Nottingham. Colonel Bosworth, who responded, said that it was a byword that the sweet reasonableness and sportsmanship of the authorities in Nottinghamshire made the life of the motorists a happy one. Colonel Bosworth described the action of the motorist who knocked down and killed a man at Kenley, and drove on without stopping, as detestable, and deplored by every motorist, and stated within a few hours of the accident the association's agents and scouts were watching over 12,000 miles of roads for a car that was alleged to have been damaged. This only showed that the

association did something occasionally which helped the police, and did not hinder them. Mr. Stenson Cooke also responded.

The toast "The Notts Automobile Club" was honoured on the proposition of Captain R. K. Bagnall-Wild. Mr. Charles Hardy, in reply, said he hoped the members of the club would in the future, as they had done in the past, drive with consideration. They must not drive as if with the idea that they had "bought the earth;" they must consider other people on the road, and by doing that they would help the growth of the automobile cause. Mr. E. M. C. Instone proposed the toast of "The Visitors," to which responses were given by Mr. A. Richardson, M.P., the Sheriff (Councillor W. H. Carey), and Mr. E. P. Hooley. Mr. Richardson thought the decision of the Royal Club to discontinue licences for competitions on public roads, unless the local authorities were in perfect agreement with them, was perhaps wise in view of a passage of the Budget speech of last April. There was little doubt that the motor industry would be dealt with by Parliament during the coming session. He hoped their action would be such that there would be no damage to their pleasure and especially to the industry, which employs so much labour and in which so much capital is invested, and he believed nothing would lead to such a result unless through an outraged public opinion.

The health of the chairman was drunk with musical honours, the acknowledgment by Mr. Hardy concluding a very enjoyable evening, a word of thanks being due to Mr. Booth Granger, the hon. sec., for the most complete arrangements he had made, and which included an excellent musical entertainment.

ROYAL.

THE legal department of the R.A.C. has now been constituted and will give legal advice free of charge to all members and associates.

The following clubs have resolved to associate with the R.A.C., viz., Irish, Kent, Norfolk, Northants, Notts, Wolverhampton, and the Ladies' A.C.

MOTOR UNION.

THE Union has made arrangements whereby the Triptyque will be at the disposal, free of charge, of all its members who intend travelling on the Continent. The Triptyque enables car owners to deposit the Customs duties on their cars in London instead of at the frontier stations of Continental countries.

According to an official *communiqué* from the secretary the following clubs will retain membership of the Motor Union, viz., Bedfordshire, Blackpool, Dorsetshire, Derby and District, Harrogate, Ipswich and E. Suffolk, Lincoln, Motor Cycle Union of Ireland, North Herts., North London, Southend and District, South Devon, Sussex County, Sheffield, South Wales and Monmouth, Welsh, Wilts, and Yorks. In some cases the recommendations of the committee have to be ratified by the members.

AUTOMOBILE ASSOCIATION.

ALREADY applications are being made for seats at the Automobile Association's third annual dinner on March 18th next, in the Grand Hall, Hotel Cecil, London.

MR. H. C. PICKERING, St. Brelade, King's Norton, is the hon. secretary of the newly-formed Worcestershire M.C.C.

AUTO-CYCLE UNION.

FOR the Auto-Cycle Union's quarterly trial to-day (Saturday), starting from the Chequers Hotel, Uxbridge, twenty-six entries have been received in the bicycle class and three in the passenger class.

The Competitions Sub-committee has decided to recommend to the General Committee of the Union that this year's International Motor-Cycle Tourist Trophy race shall be again run on a fuel consumption limit as follows:—Single-cylinder machines, 100 miles to the gallon; multi-cylinder machines, eighty miles to the gallon.

BLACKHEATH.

THE fourth annual report of the Blackheath Automobile Club gives a full record of the useful work done during the past twelve months by this organisation, which has sixty-two active and four hon. members. In addition to the ordinary runs, a number of sporting events were carried out, and it is hoped to make the programme for 1908 equally attractive. With this idea in view, those fixtures which merely comprised a run out to a certain place will be abandoned, and meetings with some definite object in view, such as a hill-climbing competition, speed judging competition, &c., will be substituted. The balance-sheet shows an income of £159 and balance in hand £24.

The annual dance of the club took place on Saturday last, when about 120 members and friends assembled, Mr. Leonard Beadle, the hon. sec., acting as M.C.

KENT.

AN extraordinary general meeting of the Kent A.C. was held at the Royal Crown Hotel, Sevenoaks, on Saturday last, to consider the following questions:—1 (a). Whether this club be in future affiliated to

the M.U. or, (b). Associated to the R.A.C. under the scheme for that purpose. 2. If it be resolved that this club be in future affiliated to the M.U. the following words in Rule 1 be deleted:—"affiliated to the R.A.C." and "affiliated to the M.U." inserted in their place.

Sir David Salomons, Bart., the president of the club, was in the chair, and was supported by the following members of the committee:—Messrs. C. J. Morgan (Chairman), W. Willis, T. H. Nash, W. E. Brewerton, Capt. Page (representing the East Kent Committee), and G. M. Kenyon (hon. sec.). There was a large and representative attendance of members, to whom Sir David Salomons explained the situation that had arisen.

Mr. Willis then moved the following resolution, being the recommendation placed before the members by the committee:—"That the Kent Automobile Club be associated to the Royal A.C. under its association scheme." This was seconded by Mr. H. Gardner.

A long and interesting debate ensued, in which the following members took part:—Messrs. T. H. Nash, A. Booth Hearn, A. R. Norman, C. J. Morgan, W. Wylie, J. D. Siddeley, C. E. Wright, H. T. Englehardt, and Capt. Page. The president and the hon. secretary answered various questions raised during the discussion. The resolution moved by Mr. Willis was then put to the meeting and was carried unanimously. The hon. secretary was then instructed to give formal notice to the M.U. to terminate the agreement.

The Hon. Secretary then referred to the work done in the past by the Motor Union and Mr. Rees Jeffreys, and proposed the following resolution, which was seconded by Mr. H. Gardner and was carried unanimously:—"That the Kent A.C. regrets the necessity for severing its connection with the Motor Union, but tenders to that body its appreciation of the good work hitherto done by the M.U. in the cause of automobilism in this country.

Mr. C. J. Morgan, the chairman of the club, proposed a vote of thanks to Sir David Salomons for taking the chair, and for his keen interest in the welfare of the club. This was carried with acclamation, which Sir David suitably acknowledged.

HEREFORDSHIRE.

THE Herefordshire A.C. has, through Messrs. Perry, Thornton and Schriber, accepted from Mr. Henry Ford a twenty-guinea challenge cup for the big open hill climb, known as the Frome Hill climb. The cup will be known as the Henry Ford Trophy, and will be won outright by the successful competitor. The basis of the award will be time in seconds occupied in climbing the hill, multiplied by pounds sterling declared catalogue price of the competing car, the winner to be that car showing the least total.

LINCOLNSHIRE.

SIR H. B. BACON, BART., will preside at the annual general meeting of the Lincolnshire A.C., to be held at the Great Northern Hotel, Lincoln, on the 1st prox. A long agenda has been prepared, and Major J. A. Cole will give a report with regard to affiliation to the Motor Union. In the annual review reference is made to the successful meeting of the M.U. which was held at Lincoln last May, and to the various social events held during the season.

During the year forty-nine new members have been elected to the club, the membership of which is now 227. The balance in hand is £97, and altogether the outlook for the future is most gratifying to those who have been responsible for the organisation of the automobile movement in Lincolnshire.

MANCHESTER.

THE annual general meeting of the Manchester Automobile Club was held at the Midland Hotel, Manchester, on Monday.

Mr. J. A. Morris, president of the club, was in the chair. The report and accounts for the past year were adopted, and the following officers were elected for the ensuing year:—President, Mr. A. E. Jones; vice-presidents, Messrs. T. W. Grace, J. A. Morris, and F. Smith; captain, Mr. A. E. Crowdy; honorary treasurer, Mr. J. Hoyle-Smith; committee, Messrs. T. W. Grace, J. A. Morris, F. Smith, F. R. Hesse, G. B. Heywood, A. G. Hogg, — Kershaw, D. A. Parkyn, S. Wallwork, and T. M. Young, with the president, captain, and honorary treasurer *ex officio*.

A discussion took place with regard to the breach between the Royal A.C. and the M.U., to both of which the Manchester Club is affiliated, and it was unanimously resolved to support a proposal to use the united influence of the provincial clubs in order to bring about a reconciliation between the two bodies.

WITH a membership roll containing 260 names, a cash balance in hand of over £183, and a record of highly successful work during the year, the committee of the Manchester Motor Club had every reason for being on good terms with themselves at the annual meeting.

It was decided to leave over to a future meeting the question of the club's affiliation with the M.U. or the R.A.C.

The officers for the current year are:—President, Mr. A. J. Bell; vice-president, Mr. J. Higginson, jun.; captain (car section), Mr. H. W. Cranham; sub-captain, Mr. E. Jones; captain (cycle section), Mr. O. Grosse; sub-captain, Mr. J. Fraser; hon. treasurer, Mr. P. H. T. Butler; hon. secretary, Mr. A. J. Moorhouse.

SHEFFIELD.

THE report of the committee of the Sheffield and District Automobile Club for 1907 shows that the membership roll has risen from 125 to upwards of 160, the balance at the bank being now £93.

During the year various road authorities have been approached with regard to the condition of their roads, and we notice that a scheme is on foot for widening the bottom of the dangerous hill from the Hathersage road, leading into Grindleford.

In the report reference is made to the various sporting events held by the club, and a new scheme is suggested by which honorary district secretaries or representatives might be appointed in such localities as Chesterfield, Doncaster, Rotherham and Worksop to awaken local interest in automobile affairs.

The annual meeting of the club will be held at the King's Head Hotel, Sheffield, on the 27th inst.

SHEFFIELD AND HALLAMSHIRE MOTOR-CYCLE CLUB.

THE annual general meeting of this prosperous club was held at headquarters, Mr. J. H. Hall in the chair. A large number of members put in an appearance, and after the minutes of the last meeting had been passed, and the accounts for the year adopted, a long discussion took place re affiliation to the Auto Cycle Union, the meeting being practically unanimous in favour of affiliating, but as certain matters are not yet definitely settled between the A.C.U. and R.A.C.,

An Accident which Might Have Happened.

it was decided to leave the matter over, and call another meeting to consider the scheme in detail in a few weeks' time.

A new rule was passed admitting hon. members at an annual subscription of 2s. 6d., lady members also to be admitted upon payment of the same amount; and it was suggested that some special competition be held for lady members during the coming summer.

The following were elected officers for this year:—President, Mr. John H. Hall; vice-presidents, Messrs. J. Haslam, W. Watts, H. Bisby, W. Hill, Brooke Shaw; hon. secretary, Mr. T. F. Turner; trials secretary, Mr. Gould; hon. treasurer, Mr. W. H. Hill; committee, Messrs. Dakin, F. Dover, Vale, J. W. Ardern, F. Farrar, W. James, C. R. Honey, Kay, Sawyer, J. A. Fairer, Tarrant, Oliver; auditors, Messrs. C. Champion and Dakin.

WEST ESSEX.

THE members of the West Essex Automobile Club held their first annual dinner at Ilford under the presidency of Mr. B. F. Wickens. Mr. J. W. Yates-Fish was in the vice-chair; and the guests included Mr. Rees Jeffreys, Mr. F. Straight, Mr. J. S. Brown, of Helmsford, Mr. Reynolds, secretary to the Essex Motor Club, and Mr. Warnery, secretary to the Southend and District Motor Club. About £50 worth of prizes were presented by Mrs. B. Foster Wickens, including a shield given by the President, and won by Mrs. W. E. Gunnett for 1907-8. In replying to the toast of "The Club," the Secretary announced that in 1905 there were only twenty-eight members, in 1906 fifty-one, and 1907 seventy.

MR. W. C. MOSS, who is known to many readers in connection with Messrs. Moss and Woodd, is prepared to accept an engagement.

CASES UNDER THE MOTOR CAR ACT.

RECKLESS DRIVING.

At North London Police Court, William Henry White, motor-car driver, of Lewisham, has appeared to four summonses, before Mr. Fordham—(1) for recklessly driving a motor-car, (2) for not giving audible and sufficient warning of his approach by bell or other instrument, (3), for failing to stop when he knew an accident had occurred, and (4) for not obeying the signal of the police to stop. He was fined £11 11s., the magistrate characterising it as a very serious case.

Robert Pickstone, chauffeur, living at Chelsea, was summoned, at West London Police Court, for driving a motor-car in a reckless manner in Earl's Court Road, and for failing to give warning of the approach of the car. The magistrate imposed penalties amounting to £12 with three guineas costs.

DISMISSAL.

A chauffeur in the employ of the "Newcastle Chronicle" was summoned for having driven a motor-car in the Westgate Road, Newcastle, in a manner dangerous to the public having regard to all the circumstances of the case. The Lord Mayor dismissed the summons.

EXCEEDING LEGAL LIMIT.

Frederick Craig, chauffeur to Mr. Marshall Hall, K.C., was summoned at Croydon on Saturday for driving at excessive speed in London Road, Morden, on December 23rd. He was defended by his employer. Police-constable 687 V, who timed the car over a measured distance, said its rate of speed was just over twenty-seven miles an hour. Defendant when stopped said his speedometer registered twenty miles, but he could not watch it every minute. In cross-examination by Mr. Marshall Hall, witness admitted that the "trap" was at the bottom of a hill, but the actual measured distance was level. He started his stop-watch with his thumb. Mr. Marshall Hall said he contested the case on principle, he being the owner of the car. His wife was inside, and, being nervous, defendant was never allowed to go too fast. He (the chauffeur) was a public school man, and had taken to motor-driving because he was subject to consumption. He (Mr. Marshall Hall) appeared there because he felt it to be a duty to the motorists who, like himself, took infinite pains not to annoy the public. The car was specially designed to prevent dust and had a speedometer attached, which he had frequently checked to ensure its accuracy. The Act was never meant for short-distance timing like in the present case. His view was that the Legislature never intended it to be enforced as the police were doing it now, stopping a motorist at the foot of a hill. He usually took one hour and twenty minutes to get to town from Ashstead Park, but the journey that day was twenty minutes longer. He suggested that the police had made a mistake, especially as the stop-watch was started with the thumb instead of in the correct way, by the first finger. Defendant said that before leaving Ashstead Park he had special instructions to be careful. When he stopped the speedometer registered twenty-two or twenty-three miles, which was due to having just come downhill. Mrs. Marshall Hall, who was in the car, deposed that the instructions as to careful driving were carried out. By a majority the Bench imposed a fine of £3 3s. and 9s. 6d. costs. The Chairman (Alderman R. V. Barrow) remarked that the Bench had been pleased to see Mr. Marshall Hall. Mr. Marshall Hall: Thank you; but I am sorry I cannot say the same about the majority of the Bench.

For travelling at a speed of thirty-nine miles an hour at Isfield on January 5th, Lionel Martin has been fined £7 10s. and costs by the Horsham Bench. Defendant pleaded that his speedometer was broken at the time. At the same court a fine of £5 and costs was inflicted on Ernest Carnell for travelling at a speed of thirty miles an hour. Mr. Staplee Firth, who defended, maintained that there was an element of doubt in the case, there being conflicting testimony on both sides.

DANGEROUS SPEED.

At the Shoreham Petty Sessions, on Monday, a case against Herbert Hardy, of Sheffield, was adjourned for a fortnight, in order to secure the presence of the defendant.

Before the Borough Justices of Winchester, on Friday last, Mr. H. G. Smith was summoned for driving a motor-car in a manner dangerous to the public and also for not stopping when an accident had happened. Mr. Staplee Firth defended and a number of witnesses were called for the prosecution. A lively cross-examination of these was conducted by Mr. Firth, intended to show that police evidence with regard to certain tracks which it was alleged were made by the defendant's car was not so clear as might have been presumed. After consultation was his brother magistrates the chairman of the bench announced that there was insufficient evidence to convict the defendant of driving in a manner dangerous to the public and they dismissed the second summons.

MR. A. E. OAKLEY has resigned his appointment as general manager of the Beaufort Motor Company, Ltd., and under the style of Messrs. Albert E. Oakley and Co. has commenced business on his own account as a motor-car and accessory agent at Allsop Street, Upper Baker Street, London, N.W. He has purchased the Beaufort Company's stock of spare parts for Beaufort cars, and has also made arrangements with the manufacturers which will enable him to secure quick deliveries from time to time. At the depot plant is also available for carrying out all classes of repairs, while several well-appointed and powerful cars are available for hiring out purposes.

THE INTERNATIONAL TOURING CAR TRIAL, 1908.

THE regulations for this trial have now been completed. The sub-committee was composed of two representatives of the Royal A.C., two representatives of the Society of Motor Manufacturers and Traders, with Mr. E. H. Cozens-Hardy, vice-chairman of the Expert and Technical Committee of the R.A.C., as chairman. The regulations were approved by the full Trial Committee on Thursday of last week, with a few slight alterations, and will be submitted to the Committee of the Club for adoption on Wednesday next. The R.A.C. and the Scottish A.C. have been in communication in regard to the regulations, and representatives of the Scottish A.C. have attended several of the meetings with the object of comparing the two sets of regulations in order that these might be in complete agreement.

The basis of the 2,000 miles trial is time lost in minutes. In reckoning the time lost, fractions of minutes will count as minutes, except on the timed hills and at Brooklands. As already intimated, the competition will finish with a race of about 200 miles on the Brooklands track. Cars will be started for the race by classes, and in accordance with their respective time records on their arrival at Brooklands, plus the number of minutes corresponding to the number of gallons of fuel taken on board for the purpose of the race at Brooklands. By this means the car of each class which first passes the winning-post at Brooklands will have won the first prize in its class, and the result will therefore be made known immediately, which is, of course, an advantage from the spectators' point of view.

The Royal A.C. will award a cup to the winner of each class and a certificate will be given in respect of the performance of each car, whether it completes the trial or not, and the club reserves the right to publish any certificate. The regulations are particularly strict as regards the driving of the cars on the road. The speed in towns and villages has to be reduced, and in no case may a car be driven to the danger or inconvenience of other users of the highway. Infringement of this regulation subjects the competitor to disqualification, and if a competitor is disqualified he loses all right to any award, notice or record.

It is proposed that the cars shall leave London for Glasgow on the morning of Thursday, June 11th, and from Glasgow follow the routes of the Scottish Trial and be under the management of the Scottish Club until the end of the Scottish trial, after which they will proceed to Brooklands track under the direction of the Royal A.C. by a route to be hereafter published.

THE RESPONSIBILITY FOR BREAKDOWNS.

THE story of a journey in a motor-car from Chichester to the Ascot Races was related before Judge Scully at the Chichester County Court, on the 15th inst. It was a claim by Mr. T. S. Adcock, motor engineer, of North Street, Chichester, against Mr. Henry Humphreys, of the Globe Hotel, Chichester, for £4 4s., for the hire of a motor-car. There was a counter-claim for £7 16s. In opening, Mr. Tompkins, for the plaintiff, said Mr. Adcock lent a motor-car with a driver to the defendant to go to Ascot Races. It was claimed by the defendant, he believed, that there was a guarantee that the motor-car should take him and his party to Ascot in time for the races and back at a certain time. That, however, was denied by the plaintiff. The question was whether the plaintiff was liable for accidents to the motor-car which he was totally unable to avoid, the car being in a proper state to go on the road. The plaintiff, in giving evidence, said the car was hired in June, 1905, at an agreed charge of £4 4s. The previous night to the hiring he drove the car with the driver up Goodwood Race Hill to test the brakes. The driver, Carpenter, gave evidence. He said he was formerly in the employ of Mr. Adcock, but was now in the 1st Searchlight Company of the Royal Engineers, at Aldershot, and driver for the captain of his company. He described the journey to Ascot, and said the stoppages were wholly due to tyre troubles. There were four persons and a large hamper on the car besides himself. Owing to being mis-directed on one occasion they went out of their way six or eight miles.

After the defendant's evidence Mr. Bew addressed his Honour for the defence, and said if this was a contract for hire there was an implied warranty that the car was reasonably fit for the journey, and if it was a contract for carriage, the contract not being performed through failure of the plaintiff, the defendant was entitled to perform it himself and charge the cost.

Mr. Tompkins argued that it was a contract for the hire of the car for the day, and that the tyre trouble was unavoidable.

His Honour upheld the contention of Mr. Bew, and said that whatever the cause of the breakdown was, excessive heat or undue weight of the party, he did not know, but the plaintiff was informed of the purpose for which it was wanted. He said nothing against the competency of the driver, as a driver or mechanic, but it was clear he had not a reasonable knowledge of the road, and a considerable time was lost in consequence. He gave judgment for the plaintiff for £4 4s. on the claim, and for the defendant for £6 10s. on the counter-claim, the latter being the sum mentioned in a letter by the defendant as the amount of the expenses which had been incurred. Replying to Mr. Bew, his Honour said there would be costs on the amount each party recovered.

WE hear that the Benz Company are about to introduce a new 12-18-h.p. four-cylinder car.

THE CONFERENCE OF CLUBS.

A LARGELY-ATTENDED conference of local and provincial automobile clubs was held on Wednesday of last week, at the St. Ermin's Hotel, Westminster, S.W., "in order to give the affiliated clubs the fullest opportunity of acquiring information respecting the position arising from the withdrawal of the R.A.C. from the membership of the Motor Union, and of expressing their views as to the future policy of the Union." The conference was open to the chairmen, hon. secretaries, representatives of the clubs on the General Committee of the Union, and any other delegates appointed by the committees of the clubs.

Mr. C. H. Dodd (Berkshire A.C. and Chairman of the Emergency Committee of the Union) presided, and referred to the efforts made to arrange peace between the two bodies. The Union had set to work to reorganise itself to meet the new situation, and it had been decided to recommend that an Executive Committee should be formed which should stand behind the chairman and the secretary in connection with all matters of policy. This Executive Committee had not hitherto existed, and it must strengthen the hands of the General Committee. The scope of the work open to the Union was absolutely unlimited. It was unfettered, and it would be able to carry out that work through various sub-committees.

Earl Russell opened the discussion. The Union was prepared to carry on the organisation of provincial motorists in this country as it had done in the past, and it was prepared to conduct the whole of its business by a committee on which the provincial clubs were represented in direct proportion to their membership. That meant that the supreme and controlling body of the Motor Union would remain, as it had been in the past, simply the representatives of affiliated clubs and of individual members of the Union. What the General Committee of the Union would do would depend entirely on the voting of its members, who would control the business. The ordinary legal and legislative work with which the union was extremely well acquainted would be continued in future as in the past. The union had had the best opportunities and facilities for dealing with local authorities and forwarding local interests throughout the country. He thought the conference would also know that the union had had the important experience of dealing with motor legislation. He concluded by asserting that the provincial clubs should have absolute liberty and self-government.

Among those who continued the discussion were Messrs. Blewitt (Midland), E. H. Myddleton-Gavey (Sussex), J. H. Reeves (Kensington), R. W. Buttemer (West Surrey), Godfrey Lowe (Lincolnshire), J. Barber (Sheffield), J. Potter (Blackpool), W. Bourke (Berkshire), Rev. J. H. Short (Cardiff), Thompson Willows (South Wales), A. Armitage, J. P. (Somerset), and T. W. Grace (Manchester). The latter moved the following resolution:—"That the provincial clubs are of opinion that unity of automobile organisations is at present absolutely essential, and it is imperative that a new agreement between the R.A.C. and the M.U. should be entered into, so as to avoid the certain disintegration of the motor forces of the country that is sure to be otherwise felt, and the R.A.C. be requested to appoint a committee to meet a committee representative of the provincial clubs to consider the terms of such agreement."

This was seconded by Mr. J. E. Hodgkin (North Eastern) but it was agreed that it should not be put to the meeting. Dr. Hopkins Walters (Berkshire A.C.) said he wished to put it strongly to the Conference that the strength of the affiliated clubs rested in their unity. Whatever the Union did, the important thing was that there should be as little overlapping as possible, and that they should endeavour to ascertain what the policy of the other body was. He did not think there would be any great differences upon essential points. He was glad that Mr. Grace's resolution was not put, because they were simply met in conference, and the result of the discussion was to be conveyed by the representatives of the clubs to their members in the provinces. Then at the General Committee on the 29th they would be able to express the views of their organisations, and that was the time when they would be able to decide upon important matters of principle.

A vote of thanks to the chairman closed the proceedings.

POLICE TRAPS.

THE Blairgowrie District Committee recently met at Cupar Angus, when it was reported that the County Clerk had written saying that a number of constables had been specially told off to test the speed of motor-cars. The Chief Constable of the county is to be asked to report as to the hire and purchase of stop watches for the police.

AT Ewell the police trap is in frequent operation against speedy motorists.

ISFIELD now has its police trap, leading to the Horsham court.

A TRAP has been established by the police at Crook Log, Bexley Heath.

THE police have a trap at Great Ponton, on the Great North Road, victims of which appear at the Grantham (Spittlegate) Petty Sessions.

MR. JAMES GALLAHER, of Gallaher, Ltd., has placed an order with the Daimler Company, through Messrs. Leslie Porter, Ltd., Belfast, for a 30-h.p. live axle "Birdlip" limousine car, with a 9 ft. 6 in. wheelbase. The company have also received an order from Messrs. Koller, Caspary and Co., Christiania, Norway, for a 42-h.p. "Daventry" limousine car.

AUTOMOBILE ACCIDENTS.

DR. THOMAS has made inquiry at Paddington Coroner's Court with regard to the death of Jane Blackett, aged 77, who was knocked down and fatally injured by a motor-car. Frederick Butler, a porter, said that the old lady started to cross Edgware Road just as a motor-car was approaching at an ordinary rate of speed—about eight or ten miles an hour. The driver attempted to get round her, but she hesitated, stepped back, then went forward again, and was knocked down by one of the mud-guards of the car. This evidence was confirmed by other witnesses, who said that no blame could be attached to the driver, as immediately he saw the deceased he put on both his brakes and made every effort to avoid her. Death was due to injuries to the ribs and skull, and a verdict of "Accidental death" was returned.

LADY MARSHALL was driving in her motor-car across Blackfriars Bridge, London, when the vehicle collided with a coal-van, the offshaft of which passed through the front glass panel of the car and was broken off. The horse in the van was thrown down on to the pavement. Lady Marshall fortunately received no injury, but, being anxious as to the condition of her chauffeur, she accompanied him to St. Bartholomew's Hospital in one of the City electric ambulances. He was found to have a badly injured shoulder, and was detained.

A MOTOR-CAR fatality has occurred at Boughton, between Canterbury and Faversham. Mr. E. J. Philpot, a motor and cycle agent, was in the act of turning the starting handle preparatory to returning to Canterbury, when the vehicle, the gear of which had apparently been left in, started forward and ran over him, inflicting fatal injuries.

A MOTOR-CAR fatality is reported from Hindhead. Mr. James Halley, an inventor, of Crouch End, was walking along the Portsmouth road, attended by a nurse, when a motor-car belonging to Sir Archibald Macdonald, Bart., approached from the direction of Liphook. Mr. Halley,

The Star Six-cylinder Live Car Axle recently completed by the Star Engineering Company to the order of their Agents in Singapore for a Chinese Mandarin.

The vehicle, which is fitted with a luxurious limousine body, also by the Star Company, has a standard six-cylinder motor, 4½ in. bore by 5 in. stroke, and two ignitions, Simms-Bosch high-tension magneto and synchroised coil and accumulator.

designedly, got in the way, and the efforts of the nurse to drag him away in time were unavailing. The driver of the car applied his brakes and swerved to the side of the road, but it was too late to avoid a collision. The car struck Mr. Halley on the head, knocking him down and inflicting injuries to the skull. He was taken to the Haslemere Cottage Hospital, where an operation was performed, but he succumbed to his injuries. At the inquest on Tuesday a verdict of suicide whilst of unsound mind was returned, the motor-car driver being exonerated from blame.

MR. TROUTBECK held an inquest at Westminster, on Monday, concerning the death of William Drury, of Clevedon Place, Eaton Square. Harry Woolben, a clerk, of Eaton Place, said that on Friday he saw a motor-car approach at a walking pace in Sloane Square, from three to five miles an hour. The deceased was standing in the roadway, and when he saw the car he seemed confused and undecided what to do. He swerved when the car got close to him, "made a grab" at the front of it and was knocked down. At that time the car was hardly moving. The driver sounded his hooter several times. The jury returned a verdict of "Accidental death."

A MOTOR-CAR accident occurred on Tuesday between Helsby and Frodsham, Cheshire. Mr. Gilbert Blackburne, the eldest son of Colonel Ireland Blackburne, Hale Hall, Lancashire, was driving his own car, when about half-a-mile from Helsby it skidded and the wheel came off. He was thrown out, and sustained a broken thigh. His chauffeur's face was cut.

FORTHCOMING EVENTS.

JANUARY, 1908.

- 24th (F.).—Annual dinner of the Scottish A.C. at North British Station Hotel, Edinburgh.
 24th (F.)—Feb. 1st.—Scottish Motor Exhibition in the Waverley Market, Edinburgh, to be opened by Lord Kingsburgh.
 26th (Sun.).—Criterium de Voitures et Coupe de l'Exposition Trial for motor-cycles organised by the Turin A.C. and the Motor Club of Italy.
 27th (M.).—Annual general meeting of the Motor Cycling Club at 8 p.m., at the Tudor Hotel, London, W.
 Annual general meeting of the South Wales and Monmouthshire A.C.
 29th (W.).—First lesson of the course to be given by Mr. R. S. Currie to the Ladies' A.C.
 30th (Th.).—Annual dinner of the Yorkshire A.C.
 31st (F.).—Annual meeting of the Blackheath A.C.
 Last day for receiving nominations for the representatives of individual members upon the General Committee of the Motor Union.

FEBRUARY.

- 1st (Sat.).—Annual meeting of the Lincolnshire A.C.
 2nd (Sun.).—Reliability Trial of the Motor Union of Western India.
 4th (Tu.).—I.I.A.E., Dr. Hele-Shaw's address to graduates' section.
 5th (W.).—Annual dinner of the Bradford A.C.
 6th (Th.).—R.A.C., Mr. Philip Dawson on the Electrification of Railways.
 12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 15th (St.).—Auto-Cycle Union annual dinner at the Hotel Cecil, London.
 20th (Th.).—Meeting of the Essex M.C.
 21st (F.)—29th (Sat.).—Manchester Motor-Car Show at Belle Vue.
 24th (M.).—Motor Show at Bombay.
 27th (Th.).—Mr. Mervyn O'Gorman at the R.A.C. on "Gear Transmission."

MARCH.

- 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 21st (S.)—28th (S.).—Cordingley's Thirteenth International Motor-Car Exhibition at the Royal Agricultural Hall, London.

APRIL.

- 48th.—First meeting of the Brooklands A.R.C. for 1908.

MAY.

- 10th (Sun.).—Targa Florio Race.
 11 (M.)—16 (S.).—Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

- 11th (Th.).—Probable start of the International Touring Car Trial of the R.A.C.
 15th—19th.—Scottish Reliability Trial.

LIGHTING-UP TIMES—LONDON.

" 26th—5.36	28th—5.38	30th—5.41	Feb. 1st—5.46

COMPANY NEWS.

CHESHAM AUTOMOBILE SUPPLY COMPANY.—£10,000. Agreement with W. E. Middleton and P. C. Middleton. 5 and 6, Eccleston Place, S.W.

TURNER'S AUTOMOBILE WORKS.—£5,000. To take over business of builders, constructors, and repairers of motor-cars, vans, and automobile vehicles carried on by W. Turner and R. H. Wright at Rusholme, Heald Grove, Rusholme.

ENFIELD AUTOCAR COMPANY.—At Birmingham, an extraordinary general meeting of the Enfield Autocar Company, Ltd., has been held, at which it was decided to wind up the company voluntarily. Mr. Thomas Evans (the chairman) pointed out that the directors considered this the best plan, in order to protect their assets, which had been threatened by the action of numerous creditors. They had not lost faith in the concern. So far as production went success was assured; all that was now required was £50,000 additional capital. Mr. T. D. Neal, the receiver appointed by the debenture-holders, stated that the total liabilities on January 6th were £108,258, of which £24,673 was due to debenture-holders and £83,585 to shareholders. The assets as a going concern were £69,889, leaving a deficiency of £38,369, which was equal to 9s. 2d. per share, making the face value of the shares at the moment 10s. 10d. In order to provide sufficient to pay the debenture-holders and creditors in full, they could afford to write down the assets to 32 per cent. of their value as a going concern. There were four methods open to them each of which involved the finding of cash to the extent of at least £25,000, and, in addition, the assumption of the payment of the present liabilities amounted, approximately, to £25,000. One was selling the concern to an existing company, and with this in view negotiations had been opened in two

directions. Mr. Neal was appointed liquidator, and a committee was elected to report on the suggested schemes.

KNIGHTSBRIDGE AUTOMOBILE COMPANY.—£2,000. 26, The Manor House, Marvlebone Road, N.W.

SPARE MOTOR WHEEL OF AMERICA, LTD.—The statutory meeting of this company was held on Tuesday, Mr. R. L. Wood presiding. He referred to the works in America fitted with machinery capable of turning out 10,000 wheels a month, and said there were over 300,000 registered car owners in the States. The report was seconded by Mr. H. J. Thomas and adopted unanimously, as was also a vote of thanks to the chairman.

LIMITED PARTNERSHIPS.

W. B. CHIPPENDALE AND CO.—Aeronautical engineers, &c. 56, Parkhurst Road, N. Partnership for seven years, from January 8th, 1908. General partner: W. B. Chippendale. Limited partner: L. Harding.

FROM "TRUTH" PILLORY.

Kingston County Petty Sessions. Before Mr. W. Y. Cockburn and the Rev. A. E. Baavan. J. Jarrard, charged with being drunk while having the care of three horses and a dray load of beer. Fined 10s.

Kingston County Petty Sessions. Before the same magistrates. Eight defendants charged with exceeding the motor speed limit in various parts of the division. Each fined £5 and costs.

THE CROYDON MOTOR FATALITY.

THE first steps have been taken in elucidating the circumstances surrounding the death of Edward Borer, of Kenley, who died from injuries caused in Croydon by a motor-car driven, it is alleged, by Duncan A. Brown, a chauffeur, of Hayes Court, Kenley. At Croydon Police court Brown, who is in the employ of Mr. Stewart, of Malvern, Kenley, has been charged with manslaughter, and remanded, the Bench agreeing to accept bail.

BUSINESS NEWS.

THE Stern Sonneborn Oil Company, Ltd., have a special oil for the air-cooled cylinders of motor-cycles which has been giving good results.

THE Canada Cycle and Motor Company have opened a depot at 20-22, Adelaide Street West, Toronto, for the sale of their Russell cars.

MESSRS. MARPLES, LEACH AND CO., electrical engineers, of 6, Victoria Avenue, Bishopsgate Street Without, London, E.C., have sent us a neat and useful little 6 in. slide rule, duplicates of which they will be pleased to send to any of our readers on application.

MESSRS. HYSLOP BROTHERS have moved into a large new garage at the corner of Shuter and Victoria Streets, Toronto, Canada. The garage proper is on the ground floor and has a total floor space of no less than 10,000 sq. ft. A large lift has been installed to transport cars to the top floor for repair purposes.

THE exhaust cut-out is such a valuable assistant for tackling extra stiff hills that it is a pity it should so often entail so much noise in driving. The noise is apparent, too, even when the cut-out is not actually in operation, owing to these fittings rarely being gas tight when closed. To obviate this, the E. M. Bowden's Patents Syndicate, Ltd., have just introduced a new pattern with a special valve—practically an inverted exhaust valve—which entirely precludes any escape of gas.

THE Touring Information Department of the Continental Tyre and Rubber Company is open to give tourists the fullest information with regard to journeys on the Continent, especially in France and Germany, and intending tourists in the first named country may obtain on application the Continental French Guide Book, published at 2s., which is compiled in a similar manner to the English edition, and for tourists in Germany, the specially prepared German map and atlas giving distances in kilometres, together with all other necessary information, from the Continental Tyre and Rubber Co., Ltd., 102 to 108, Clerkenwell Road, E.C.

MESSRS. IRIS CARS, LTD., of Bird Street, Oxford Street, W., have sent us a copy of an attractive coloured picture entitled "A Cabinet Minister," they have just issued, depicting an Iris car leaving the Palace Yard of the Houses of Parliament at Westminster. The artist, Mr. Philip Dadd, has succeeded in depicting a realistic motor-car in conjunction with historic surroundings and lifelike representation of everyday circumstances occurring in this busy spot. Messrs. Iris Cars, Ltd., will be pleased to send a copy of the picture free of charge to any of our readers who care to apply for the same.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, FEBRUARY 1, 1908.

[No. 465.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

IN opening the Edinburgh Motor Show, Sir J. H. A. Macdonald, K.C.B. (the Lord Justice-Clerk), made reference to the growth of the British motor-car industry, in which Scotland has naturally had a place. Naturally, Sir John became reminiscent, as he has a right to do, having been one of the voyageurs on the 1,000-mile pilgrimage. Later in the day, at the annual dinner of the Scottish A.C., he referred to a census he had taken in London, where he had the opportunity of observing how many private cars there were as compared with private carriages. On one morning on the Embankment there were 234 cars to 147 carriages, and during the day all through the town there were 510 motor-cars to 242 carriages, the totals being 744 cars to 389 carriages. In fact, this advance in the number of automobiles in daily use is one of the notable things that strike every comer to our city as significant of progress.

Motors and the Army.

LAST week a further testimony to the value of the Army Motor Reserve was given at the regimental dinner of the corps held in London. Incidentally, in proposing one of the toasts, Lieut.-Col. Mark Mayhew, who presided, mentioned the fact that the distance travelled on their cars by officers of the A.M.R., whilst employed on military duty last year, was equal to almost five times the circumference of the earth. Several of the military authorities spoke as to the good work that had been done, and General Sir W. G. Nicholson, Quartermaster-General of the Forces, mentioned that the employment of mechanical transport on active service was at present receiving the consideration of the Army Council, and in the deliberations on the subject the experience of officers of the Reserve would be extremely useful. Certainly the position of the automobile in military affairs is well assured.

Automobile Education.

It is gratifying to learn that the authorities of the University of Sheffield recognise the growing interest in motor matters. Those concerned with the welfare of the town are able to realise what an important bearing the automobile industry may have upon the progress of Sheffield. Attention may be drawn to the fact that, appreciating the immense and rapidly growing demand for special alloy steels, many eminent Sheffield firms of steel producers have organised departments to deal entirely with this line, and to study in detail the requirements of motor manufacturing. The University classes in metallurgical research, therefore, are very popular. It is, however, to the newly-organised classes specially arranged for—(a) motor-car owners, (b) chauffeurs and students, by the University authorities, that we would call particular attention. Many professional and other gentlemen, who would otherwise be car owners, are often slow in adopting the automobile owing to their lack of sufficient technical knowledge to enable them to dispense with the services of a chauffeur, or, if a chauffeur is employed, to enable them to judge if their proper interests are being served by him. With the object of overcoming this difficulty,

a series of lectures have been organised, in which it is intended to impart to the would-be motorist a sound grounding in the technical points of the modern motor-car. In addition to an already noteworthy engineering laboratory equipment, a 25-h.p. chassis is available for demonstration purposes, and a petrol engine fitted with magneto ignition has been purchased with which to carry out the necessary demonstration on ignition, carburation, location and repair of faults, &c., &c. It is further shortly intended to commence a series of lectures on motor-car design in the interests of young engineers and draughtsmen interested in the subject, and it is hoped to obtain the assistance of the professors of chemistry attached to the University in the study of carburation, exhaust gas analysis, &c. The classes are under the direction of Mr. A. W. Reeves.

The Event of 1908.

As we have already announced, preparations are well forward in connection with the International Touring Car Contest to take place in Great Britain during June next. The Scottish Club will control that portion of the route in North Britain, or, to be precise, from Glasgow, where the Scottish Trial will really commence. While the basis of marking in the Scottish Trial is entirely different from that of the 2,000 miles Trial, the rules of both have been considered by the Joint Committee of the two clubs, so that there shall be no actual conflict. Those of the Scottish event are to be issued simultaneously with those published by the R.A.C. for the 2,000 miles Trial, and we understand that the committees of the two clubs have arranged a basis of elimination of entries, should such be necessary owing to their exceeding the number which it is possible to accept.

The Letter H.

MERTHYR TYDFIL will be constituted a County Borough on April 1st, and the L.G.B. has assigned to its Council the letters HB for the purposes of motor-car registration. The letter H seems to have been reserved in the first place for additional registrations, as beyond the single H, which is the identification mark for Middlesex, it has only been used as a first letter in the cases of HT, the South Riding of Tipperary, and HS for Renfrew. As the final letter of the identification mark it appears in Norfolk, AH; Buckinghamshire, BH; Derby, CH; Walsall, DH; Hanley, EH; Gloucester, FH; Donegal, IH; Northampton, NH; and Berwick, SH. Those interested in the curiosities of motor-car identification marks should send to the office of the M.C.J. for a copy of our identification card, which will be sent post free to any reader making early application.

Motoring in India.

THERE was quite a gathering of the clans at Bombay when Mr. W. T. Lord set out from there recently to make the trip to Calcutta on a 14-16-h.p. Argyll. He intended to travel from station to station under ordinary touring conditions, accompanied by Mr. Charles Wildbore and a native servant, who would also act as interpreter. From several points of the journey come news of progress, and some of the incidents *en route* were decidedly interesting. Shortly after

leaving Agra—the road running parallel with the narrow-gauge railway to Cawnpore—he was hindered by a herd of buffaloes. One night he stayed at an inspection bungalow at Monomow. There were bungalows about every twelve miles, but food was unattainable in towns. Luckily he and his companions were able all through to supplement the larder by the gun and rifle, there being no lack of buck, chinkara, duck and partridge. He failed to get petrol at Cawnpore, and as the Argyll would not assimilate the drop of Scotch whisky he gave her, he slept in the tonneau while the mechanic travelled by other means into Lucknow for the necessary spirit.

London to Edinburgh.

As usual, the Motor Show at Edinburgh has again incited many intrepid motorists to dare the elements in chill and foggy January. This year new interest was given to the time-honoured jaunt to the north by the test given the new English-built model of the 20-30-h.p. Lorraine-Dietrich car. It was driven by C. Bianchi, and a start was made from London at 6.20 p.m. on Friday of last week. As soon as the outskirts of London were reached a dense fog was encountered, and

Messrs. Bianchi and C. Lamb leaving Great Marlborough Street, London, W., for Edinburgh on a 20-30-h.p. British-built Lorraine-Dietrich.

progress was considerably hampered. Going northward the fog thickened, and at Bawtry, in Yorkshire, the passengers had to dismount and take turns in leading the way afoot, lamp in hand. Later the gloom lifted somewhat, and then better advance was made until the car eventually reached Edinburgh at 3.30 p.m. on Saturday last. Under the climatic conditions that prevailed record making was out of the question, but the British car worthily sustained the reputation of the French vehicles of similar name.

Benzol as Fuel.

MR. A. E. CROWDY, who represents the Wolseley Company in Manchester, has for some time past been carrying out some experiments with the use of benzol in place of petroleum spirit in petrol motor-cars, and while the tests have not been of sufficient duration to enable him to make any conclusive deductions, he has kindly furnished us with some interesting information. Mr. Crowdy writes:—"As you may know, there are two separate and distinct spirits (benzol) on the market at the present time, one of which has a large percentage of sulphur,

which makes it unfit for use in motor-cars; the other, the spirit which I have been using, is quite free from all trace of sulphur, and gives excellent results. I find in actual practice, that the aperture of the jet in the carburettor requires to be at least .004 in. smaller in a four-cylinder engine with a bore of 100 mm. than that used for petrol, and also that the air supply requires to be slightly increased. When the carburettor is correctly set, the engine starts without any difficulty, and appears to give as much power as if petrol was being used, whilst at the same time considerably more mileage may be obtained to the gallon, by reason of the smaller jet and extra air supply. So far as I have been able to ascertain, there is no deposit resulting from the use of this benzol, neither does it exercise any adverse effect on the working of the engine. It is perhaps not generally known, that the carburettor fitted to the Wolseley-Siddely cars of to-day is so constructed that it is possible, by making small adjustments, to use (1) spirit which has a specific gravity of .710, (2) spirit which has a specific gravity of .760, and (3) rectified benzol. The relative cost per gallon of these spirits in the North of England is approximately as follows:—(1) .710 spirit, 1s. 2d.; (2) .760 spirit, 1s. 1d.; (3) benzol, 1s." Later on Mr. Crowdy intends to make some very careful consumption tests, using ordinary Pratt's spirit of a specific gravity of .710 as a standard for the comparison, and at the same time hopes to get the comparative b.h.p.

A Police View of Traps.

A SAD accident in which a motor-car was associated seems to have led to a kind of panic among the City Fathers of Belfast, and their application for a reduction of the speed of all motor-cars passing the town to ten miles an hour has produced something of a Gilbertian situation. For the Police Commissioner regards his powers under the Motor Car Act as amply sufficient to protect the public. In fact, he told the Inspector at the inquiry that the proposed restriction would rather weaken the position than otherwise. The administration of the new by-law would certainly necessitate the employment of more policemen to discharge this special duty, which would mean increased cost on the ratepayers for no advantage that he could see. The introduction of police traps was not conducive to good feeling towards the police. In the fatal accidents that had occurred the juries had especially exonerated the drivers from blame, and in each case the speed was below ten miles.

Open Competitions on the Public Highway.

IN view of the discussion which has arisen as to the attitude of the Royal A.C. with regard to the open competitions on the public highway, it may be well to recall the terms of the resolution which was adopted by the General Committee of the Club, and which has apparently not been clearly understood by many members of the various clubs concerned. The exact wording of the motion was as follows:—"That in view of the annoyance caused locally, and in the interests of the automobile movement generally, the Club shall neither hold nor issue any permits for open competitions other than reliability trials, nor support any closed competitions on the public highway where a speed in excess of the legal limit is a factor, unless such highway has been closed to ordinary traffic by the authorities, or the competitions are held on the fore-shore with the sanction of the authorities." In arriving at its decision we understand that the Club was influenced by the large number of complaints received from those resident, adjacent to, or even on the hills where most of these open events were held during 1907, and by the annoyance caused by the holding of these events, not so much on the day itself when the competition was under proper control, but for some days before the event, when large numbers of cars practised at high speeds up and down the hills. Closed competitions are, of course, in a different category. A closed event, which is a competition confined to members of a club, is much more easily supervised by a local club. It can more easily be confined within proper limits,

and if the authorities are favourable to the idea the risk of opposition on the part of the public is likely to be avoided. Clubs need not, moreover, apply to the Royal A.C. for permits for closed competitions. In regard to motor-cycling competitions the Club has made no pronouncement; it has handed over the control of motor-cycling to the Auto-Cycle Union, and the question of holding hill climbs for motor-cycles concerns that body only.

Thefts from Cars.

INSTANCES of thefts from motor-cars have been somewhat frequent of late—whether from the growing carelessness of owners or the increasing boldness of others we will not venture to determine. The fact, however, remains that the warning recently addressed through our Correspondence columns by leading motorists should be in the memory in 1908 as well as in the latter days of 1907. Time was when rugs, bags, &c., might safely be left on automobiles while the driver and

danger signal be put up at dangerous corners near schools. In addition warnings by the teachers are very necessary.

The Improvement of Carriages.

A LITTLE-RECOGNISED effect of the automobile on the industries of the country has been the increased variety that is now seen in any carriage builder's establishment. There is no doubt that until the adoption of the Motor Car Act, 1903, those responsible for carriage-building work had got into a rut from which horses could not remove them. That change, however, has been effected by the motor-car, as is seen in the diversity of styles of light carriages that are now seen, and in the greater number of materials now utilised in their upholstery. The sombre drabs and greys that once dominated the leather work of carriages have been superseded by striking brighter hues, and many coach builders are rejoicing in the greater scope they are now allowed in the design and fittings of horse-drawn vehicles. The carriage builder has studied the motor-car to the

M. Godard, who took part with a Spyker Car in the Pekin-Paris Run, at the wheel of the Motobloc vehicle he will drive in the New York-Paris Contest.

passengers were away for a few minutes; now the enterprise of thieves does not stop at trifles and lamps are sometimes removed, while unsecured articles are often taken. The delinquencies have no geographical limits; they occur in the provinces as well as in London, and recently our attention has been called to quite an outbreak of such exploitation in Bradford, Leeds, and other towns in Yorkshire. A word is as good as a sentence to the wise motorist, who will take due precautions after this New Year's warning.

The Dangers to Children.

EMPHASIS is given to our Comment last week on the need for children being warned as to the dangers of the road by an inquest just held at Sheffield. After hearing the evidence the coroner remarked that a number of children were killed through dodging behind one vehicle into the road of another. The jury thought that the teachers at the schools might do something, and finally it was suggested that a motor

advantage of his own particular craft, and his attempt to cater for new requirements has given him a desire to improve those with which he is most intimately associated. Further evidence of this excellent "sign of the times" is seen in the encouragement of carriage classes at county shows, and we expect great enterprise in that direction this year. In fact, it would appear that all classes are recognising the truth of what the motorist has sought to impress upon his friends, viz, that the motor-car will relieve the horse of his burdens, and enable him to take his place on the road as a means of pleasure and sport.

DURING the hearing of an action the other day at the Southwark County Court, one of the counsel said, "I don't know whether your Honour indulges in the sport of motoring?" Judge Willis: Sport, do you call it! I was never in a motor-carriage but twice, and then I kept it at a proper speed—twelve miles an hour—and enjoyed it. The second time I was glad to get out." And, of course, everyone in court smiled; some even laughed.

SOME TYRE WORRIES AND HOW TO AVOID THEM.

"'Tis strange but true, for truth is always strange,
Stranger than fiction."

THESE words of Byron surely apply to tyre stories. I certainly know nothing so singular as the different luck the amateur motorist has with his tyres; one man rarely goes for a spin but a cover bursts or a tube punctures; another has the same set of tyres and even does not pump them up once in six months, and as to trouble he is a stranger to it. Truly Sladen says:—

"Vox et preterea nihil; and the name
Of chance is but the argument of fools,
Sworn with th' expansion of their own conceit.
Can that which is not, shape the things that are?
Is chance omnipotent—?"

I think we can put aside the question of make. The leading tyres now on the market are all equally good. It is the old,

of the canvas lining. These states may be considered more in detail.

Insufficient inflation causes excessive lateral tension, with a resulting rolling action that may tear the sides of the cover from the beaded edge. The correct pressure is usually given by the makers and varies with the size of the tyre and the weight it has to carry; it is less on the front than on the driving wheels. On 65 mm. tyres with a light load a pressure of 50 lbs. per square inch is enough, whereas on larger ones the pressure may be 90 lbs. The average gauge on a pump only shows the pressure of the air passing through the pump, but tyre gauges are on the market that register the air pressure inside the tyre, and since systematically using such an instrument I have maintained the correct pressure, and, as a consequence, have had much less tyre trouble.

Sufficient French chalk or black lead must be dusted inside the cover to prevent the air-tube sticking to the casing; but too much forms lumps that may cause friction and so damage the tube. Dirt and mud being left between the rim and tyre after a run may cause the former to rust—another producer of

Motor-Cars and Hunting.

The Earl of Harrington, the master of the pack bearing his name, always arrives at the meet in his car. The illustration above shows the Earl in the act of removing his motoring clothes, at Bleasby Hall, the seat of Captain Kelham. The Earl carries with him on the car several terriers for use when the fox goes to earth.

old story of a poor workman blaming his tools. In some cases, it is true, the tyres are not the size for the weight of the car, but more often the tyres suffer from want of attention. Given "a dream" of a tyre, take corners sharply, back on to sharp kerbs, run over sharp flints with only half inflated tubes, and even such a tyre will object and show its resentment of the neglect by bursting or puncturing. Detachable rims are, of course, very interesting, and may save trouble, but with care the trouble could be avoided, and tyres but changed in the garage, when with proper levers, especially a forked one, the beaded edge cover is easily taken off and put on; and even the introduction of the valve presents no difficulty if a forked lever is employed, which also facilitates the introduction of the security bolts.

The causes of tyre deterioration are insufficient inflation, neglect to put enough French chalk between the tube and the outer cover, or dusting in too much, with consequent lumps that cause friction, contact of tyre with grease or rusty rims, imperfect alignment of wheels, neglect to stop holes or cuts in the outer cover, and thus admission of damp with consequent rotting

wear. It is a good plan to occasionally remove the tyre, and, after cleaning, paint the rims. "Prevention is better than cure"; water externally has no bad effect on a tyre; in fact, it does the rubber good; but water permitted to get to the canvas may do much harm, and is a common cause of a "burst."

If the front wheels are not in alignment with the back ones then, as the wheel moves, there is a combined sliding and rolling action, which is of a grinding nature and soon wears out the cover. I remember once wearing big holes in a tyre merely in a run from Wakefield to London; an examination showed this to be the cause, and after adjustment of the front wheels and the actuating arms the return journey on new front tyres was made without a scratch. The lesson was learnt at the cost of a couple of covers, but it was cheap at the price. I now always see that the steering wheels are parallel to the driving ones. Covers, of course, frequently get cut, and often the cut does not extend into the tube. Perhaps the flint or other foreign body, such as a nail, is left neglected in the tyre; it may then work its way and ultimately cause a puncture, or, if the owner is lucky, the foreign body may work out without causing tube injury, but if the

opening is neglected wet gets in, and the canvas rots, with ultimate bursting of the cover. I confess that I used not to stop up holes in covers or inspect every night to see if there were any. As a result I had a burst on a journey home from Eastbourne on a lonely road, four miles from a repairer. Luckily I had a spare cover, but I certainly recollect the job I had in getting it on without help and without a forked lever. It took over an hour, and was hot work. Still it was an instructive experience, and now my tyres are inspected every night. The stopping of holes is an easy task, but it must be done thoroughly. Want of care is more often the cause of the stopping coming out than the make and quality of the stopping. Pneu Cure is excellent, and so is a preparation called the Vulcan stopping and vulcanising fluid I once bought at Gamage's. This, too, requires care in application.

The hole must first be cleaned, then wiped out and rubbed with fine sand or emery paper. Then a coating of ordinary rubber solution should be applied. Any quick-drying solution answers; personally I like the one made by the Dunlop Company. When this is dry, which usually takes twenty minutes, the hole must be filled up with the Vulcan stopping, putting in a little at a time with the edge of a penknife, letting it dry and then pushing in a bit more. After the hole is more than filled up it should be left for an hour at least to set, and then the patch should be painted over with a coat of vulcanizing solution. I have now on my car two such holes, which were filled up in this manner nearly three months ago, and the stopping is still in, and, what is more, looks as if it would outlive the tyre. I have also used this fluid for vulcanizing on a patch to a punctured tube, and it answers well, though when time permits I generally get punctures in tubes repaired with a hot vulcanizer, such as "H. F."

The valves of the inner tubes may occasionally leak; it is as well to carry a spare valve plug and valve seating and rubber plug washers; these may wear and thus allow tyres to become deflated, and though, of course, in an emergency spare temporary washers can be made out of a bit of soft leather or rubber insertion, it is easier to have a washer that will fit in the kit carried on the car. A common cause of puncture is nipping of the inner tube by either the security bolts or the edges of the cover. These torts can all be avoided by care in putting in the tube. If it is slightly inflated before the outer edge of the cover is put into position, the latter should not catch the tube, and if each security bolt is pushed up prior to that portion of the cover being levered over, then it is impossible to nip the tube, as the bolt should then move freely and only come back when the tyre is pumped up.

A little care in driving will greatly prolong the life of a tyre, especially in not letting the clutch in too suddenly and in avoiding all fierceness of that member. A little castor oil has a marvellous effect on the clutch leather, and, in addition to adding to the life of the tyres, saves the machinery. A fierce clutch often accounts for a broken bevel or a fractured differential sleeve. Sudden application of the brakes, by causing the driving wheels to skid, not only causes wear by friction, but also tends to tear the rubber from the fabric; taking corners sharply is another cause. Tyres will last much longer if the clutch is slipped in turning, and if, when possible, the car is driven on the crown of the road.

These are, I know, all simple facts, but from experience I have learnt that attention to these points reduces tyre expenses and saves roadside tyre repairs.

C. T. W. H.

MESSRS. MARKT AND CO., 6, City Road, E.C., are introducing the Brown Compressometer, which will enable the compression in each of the cylinders to be determined quite easily. It is a 100 lb. gauge fitted with a maximum hand which remains at the highest point of compression. The device is employed by simply being screwed into the cylinder in place of the sparking plug, the motor being turned over by hand and the pressure being immediately indicated on the dial. A new automobile oilstone is also being marketed by Messrs. Markt and Co. for grinding and smoothing rough surfaces.

STARTING ENGINES BY THE LEFT HAND.

IN the case of petrol motors revolving clockwise there is an element of danger in the use of the right hand for turning the starting handle, for if a back-fire occurs the operator is thrown with force against the lamp or mudguards, and he is indeed lucky if he escapes with a sprained wrist and a few bumps or cuts, not to mention the damage to the lamp or mudguard. Furthermore, the body is cramped and is of necessity turned half way around so that the fullest force can be exerted, a position inviting loss of balance. Herein the motorist who uses his left hand for starting the engine is, considers our French contemporary "L'Omnia," at a decided advantage. Grasping the handle as he does, with the fingers curved (the thumb simply retaining the handle within the fingers), when a back-fire occurs the arm is thrown outward, the fingers are opened and no damage is inflicted. Further, the left-handed operator squarely faces the machine, and by reason of the distance between his feet and a firm grip on the radiator or dumb iron with his right hand, it is next

Diagram Illustrating Position of Operator in Starting up Petrol Engines.

1. Usual position in starting an engine by the right hand. 2. Position when starting an engine which turns to the left (most engines now rotate clockwise). 3. Position when starting an engine by the left hand.

to impossible to throw him from his balance. The hand grasping the dumb iron also assists in the exertion of more strength on the starting handle. This question of using the left hand has been discussed by several doctors and constructors in our contemporary, the above reasons being cited for its use in place of the right hand. At least two French motor-car factories are stated to train all their mechanics to use this hand in starting. With low tension ignition it is essential that the motor be turned over quickly in starting, and this can be more readily accomplished if the left hand is used. The use of the left hand is most desirable because of the fact that it renders the driver immune from injuries due to back fire.

A MOTOR-CAR exhibition is to be held in Moscow from May 17th to June 2nd next.

ACCORDING to the meteorologists there will be a return of fine weather and dusty roads during the present year, and already motorists are anxiously considering the various fitments that can be added to the car to render it suitable for touring. Among these is the Rivett wind and dust screen, which has the distinct advantage of being instantly raised or lowered while the vehicle is in motion. It is the invention of Mr. A. Rivett, of 236, High Road, Leytonstone, Essex, who was one of the pioneers of the motor business in the eastern suburbs. When in the upright position its appearance is of the customary character. When the top half is let right down the advantages of the usual folding screen are obtained, with the additional merit that the top half inclines towards the driver, securing a maximum of protection for the hands and body of the driver. Should rain come on suddenly while the car is in motion the screen can be at once raised high enough to protect those on the driver's seat, and yet the driver gets a clear view over the top. There is no hindrance to freedom of movement on the part of those behind the screen, and the method of securing the device is an effective assurance against the rattling too freely associated with such accessories.

CONTINENTAL NOTES.

Another Race in Sicily.

In addition to the voiturette and heavy car races which are to be held in Sicily in May next, it has now been decided to hold a third event, to be known as the Coupe des Voiturettes Trinacria, for vehicles the four-cylinder engines of which have a bore of between 90 and 100 mm. or 106 mm, the latter figure having not yet been definitely fixed. The race will be over a distance of about 450 kilometres. The entry fee has been fixed at £40 per car; the winner will secure the Trinacria trophy and a prize of £320, the second prize is £200, the third £80, and the fourth £40.

A Voiturette Race in Italy.

In connection with the motor-car exhibition at present being held in Turin a race for voiturettes took place on Sunday last over a 36 kilometre circuit, which had to be covered five times to give a total distance of 180 kilometres (112½ miles).

Pekin-Paris event; a De Dion, with M. B. Saint-Chaffray at the wheel; a Sizaire-Naudin, driver M. Pons, and a Züst, driver M. Scarfoglio.

A 200-h.p. Flat Racer.

"Les Sports" of Paris reports that the Fiat Company are building a 200-h.p. car capable of maintaining an average speed of over 100 miles an hour. It is added that the vehicle will be driven by Nazzaro on the Brooklands track against the Napier.

Miscellaneous Items.

A syndicate of the firms in Paris making a business of hiring out cars has just been formed.—The date of the proposed tour of France for motor-cycles and light cars, which is being organised by the Auto-cycle Club of France, has been altered. It will now be held from the 23rd to the 29th April instead of from the 4th to the 9th of May.—The Austrian Automobile Club proposes to hold a trial of industrial motor

The Turin Coupe des Voiturettes.—Giuppone on the winning Lion-Peugeot Car descending the Pins Hill.

The contest was open for vehicles of a maximum bore of 100 mm. for single-cylinder engines and 80 mm. for two-cylinders, the total weight of the cars being not more than 500 and 600 kilog. respectively. There were only eight starters, including three each Lion-Peugeots and Padus (an Italian-built vehicle), a Sizaire-Naudin and an Alcyon. One of the Lion-Peugeots fell out in the first round, only four finished the second lap and three the third circuit. At the end of the fourth round only Giuppone on a Lion-Peugeot and Cissac (Alcyon) were left in, these two finishing in the order named in 4 h. 12 min. and 4 h. 32 min. respectively.

The New York-Paris Motor Run.

Considerable excitement prevailed in the neighbourhood of the offices of "Le Matin," in Paris, on Tuesday, when four cars which have been entered for the projected New York-Paris run set out for Havre. The vehicles were a Motobloc, which will be driven by M. C. Godard, who with a Spyker went through the

vehicles in July next.—A company has just been formed at Brunen, near Wesel, Germany, to establish a public motor-car service in the district.—An automobile club has lately been formed at Limoges, France.—A motor fire-engine is to be added to the equipment of the fire brigade at Elberfeld, Germany.—Quite a number of low-powered four-cylinder cars have lately made their appearance in Germany. Messrs. Stoeber, of Stettin, for example, are building a 6-12-h.p. vehicle, and the Siemens-Schuckertwerke of Berlin one of 6-10-h.p.—The Automobile Club of Nice is placing a motor ambulance at the service of the municipal authorities of Nice. The body is mounted on a Delaunay-Belleville 24-h.p. chassis.—It is now announced that the drivers of the Panhard trio of cars in the A.C.F. Grand Prix race will be Heath, Cissac, and Maurice Farman.—The tenth anniversary of the founding of the Austrian Automobile Club is to be celebrated by a banquet in Vienna on the 6th inst.—On Tuesday, "Les Sports" stated that the Dieppe circuit had again been definitely adopted for the 1908 A.C.F. Grand Prix race.

THE SETTING OF VALVES.

LARRAD'S PETROL MOTOR TIMER.

JUDGING from the correspondence we have received, the article published in the *M.C.J.* of the 11th ult. on the subject of the setting of the valves, inlet and exhaust, of petrol motors, has attracted more than passing interest. It will be remembered that we gave the setting adopted by seven leading motor-car firms, and pointed out that in each and every case a different arrangement was employed. One result of the article has been the bringing to our notice of a device known as Larrad's Timer, which has lately been put on the market by Larrad's Patents Syndicate, of Bexhill, and 21, Holborn Viaduct, London, E.C., by the use of which motorists are enabled to secure the absolutely correct setting of the inlet and exhaust valve lifting cams of petrol engines in a very short space of time.

We give an illustration of the instrument in Fig. 1, from which it will be seen that it consists of a disc carrying a specially-shaped spirit level on a spindle. Projecting from one side of the spirit level is an arm with three holes drilled in it. The disc also has several holes, each bored at a certain radius from the centre corresponding with those in the arm of the spirit level. A peg is provided, which passes through the one or other of the holes in the arm, and into one of the holes on the disc. The outer radius holes in the disc are three in number, one representing zero, and the other two the opening and closing positions of the exhaust valve. The two middle radius holes represent the opening and closing positions of the inlet valve, and the two inside radius holes represent ignition positions. The method of timing an engine with this device is carried out as follows:—Set the piston at the top of its stroke, then fix the instrument on the clutch, flywheel, crankshaft, or other suitable part revolving with the latter. Place the peg in the hole marked zero, and adjust the disc until the air blob is central. Then place the peg in the hole on the exhaust radius marked "open," and turn the crankshaft till the air blob is again central; the exhaust valve should at this

Fig. 1.—General View of Larrad's Petrol Motor Timer.

point commence to lift. Continuing, remove the peg and place it in the hole marked "closed," rotate the crankshaft as before until the air blob is central, and the exhaust should be just closed. To time the inlet valve practically the same operations are repeated, with the peg in the respective holes in the middle radius.

First place the peg in the inlet hole marked "open." This time, instead of revolving the flywheel in the direction of the arrow, move it slightly back till the air blob is central, which gives the position when the inlet valve should commence to lift. Now place the peg in the hole marked "inlet closed," and revolve the

Fig. 2.—Diagram of Valve Setting as given by Larrad's Timer.

flywheel again in the direction of the arrow. When the air blob is in the centre of the spirit level, the inlet valve should be just closed. The holes in the inner radius are marked M and A, and represent high-tension magneto and accumulator and coil respectively, while for low-tension the hole marked zero should be used. With the peg in its relative hole and the crankshaft turned until the air blob is central, the retarded ignition position is obtained. The disc is marked on both sides, so that, by reversing the positions of the holder and spirit level, it can be used equally well at either end of the engine.

An examination of the instrument showed at once that Larrad's Timer is not merely a device to facilitate the setting of valves, but gives a particular setting, which is, we learn, the result of long experiment on the part of Mr. Larrad, who claims that by altering the cams or adjusting the valve tappets, or both, to suit it, any high-speed engine will not only develop greater power than with its old arrangement, but will also run quieter and slower than before. This is a specially interesting point, as from the information the Syndicate have furnished us with, and now published for the first time, and from the diagram (Fig. 2) we have prepared, it will be observed that the Larrad timing differs considerably from the practice adopted by the makers mentioned in the article already referred to. In the first place, it will be noted that the exhaust valve opens very early—52 degrees from the bottom of the firing stroke of the piston—while it closes late—22 deg. down on the suction stroke. The inlet valve is timed to open late—17 deg. down on the suction stroke, and to close late, 17 deg. up on the compression stroke. The most striking feature of the setting, apart from the very complete scavenging of the exhaust gases, owing to the long period the exhaust valve is open, is that the inlet valve opens 5 deg. on the suction stroke before the exhaust valve closes—that is to say, both valves are for a brief period open at the same time. We have in hand a further series of diagrams of different makers' valve setting, which we hope to publish in an early issue, and among them is one in which the practice of overlapping is followed, and, as it is that of a very successful car, Mr. Larrad has some outside support for his claim that it ensures the charge of gas admitted on each suction stroke being a very rich mixture, and not reduced in power by any unexhausted burnt gases. It is claimed, in fact, that the overlapping has the effect of causing the inrush of explosive mixture to chase

out, as it were, any remaining exhaust gases, and that there is no danger of back shots in the carburettor.

That the Larrad setting is one which possesses merit is evidenced by the letter from "Amateur"—the *nom de plume* of a West Country motoring enthusiast—published in our issue of the 18th ult., as well as other testimony that has been brought to our notice. At the same time, we still feel that there is room, in view of the great variation in the valve setting of modern petrol motors, for a series of tests to be carried out by some independent authority as to which arrangement—all other things in the way of valve sizes, compression, &c., being equal—gives the best result, and we have the Larrad Syndicate's authority to state that they are ready to submit their setting to such a trial at any time, so great is their confidence that the result will only be a substantiation of their claims.

Realising, however, that they cannot all at once convert every motor designer to their way of thinking, and that there is also a want of some device to enable motorists and motor

Fig. 3.—General View of Larrad's Degree Instrument for Testing the Valve Setting of Petrol Motors.

repairers to test and probably re-adjust the timing of any petrol motor, the firm have, in addition to the Timer, also introduced what they term a degree instrument (Fig. 3); this is identical with the device shown in Fig. 1, except that the disc, instead of being provided with certain holes, is marked off on one side in degrees, and, on the other, in percentages of the circle. As Captain Windham pointed out in our last issue, the cams of many multi-cylinder engines are not always set relatively exact to one another; while, again, the continual tapping of the tappets brings about a certain amount of wear which prevents the valves from opening sufficiently, and so hinders both the evacuation of the burnt gases and the inspiration of the fresh charge. It is in testing for any irregularities of this kind that the utility of the degree instrument will demonstrate itself. Apart from the valves, however, there are other directions in which the device will be found useful; for instance, it can be used for trueing steering pivots and front axles after an accident, for setting eccentrics on all kinds of engines, and also for placing any movement at particular parts of the circle.

ONE of the Union Jack motor-buses skidded so badly near Canning Town, E., on Saturday afternoon last that one of the rear road wheels was wrenched off.

LIEUT. GIMPERLING, of the 21st U.S. Infantry, has started from Denver in a motor-car on a 1,000-mile trip to Fort Huachuca, with the view of making a topographical map of Southern Arizona for the use of the U.S. War Department.

LIGHTS ON VEHICLES.

THE object of the Lights on Vehicles Act, 1907, which came into operation on January 1st, was to necessitate that "no person shall permit his vehicle to be in any street or road during the period between one hour after sunset and one hour before sunrise without providing a light"; certain exemptions were, however, allowed. These can only be granted by the town or city councils, and then special circumstances must be established. So far as we have been able to ascertain by exhaustive inquiry, very few Councils have found it necessary to claim any exemptions from the operation of this Act in England, Wales, and Ireland, and it is evidently being adopted in its entirety almost as a general rule.

In two or three important towns, however, where special local conditions suggest some latitude, the Town Councils have adopted special orders which have been sanctioned by the Home Secretary. Thus, for instance, the City Council of Liverpool, believing that it would be dangerous to enforce the provisions of the Act "as to vehicles when carrying certain inflammable goods, and all vehicles in certain parts of the city in which such goods are stored or dealt with," has ordered that vehicles carrying cotton shall be exempt from the operation of the Act, and also that all vehicles shall be exempt while in any of the following streets, highways, or roads, viz.:—Hawthorne Road, Westminster Road, Barlow Lane, Walton Road, Kirkdale Road, Great Homer Street, Fox Street, Soho Street, Stafford Street, Monument Place, Greek Street, Copperas Hill, Renshaw Street, Berry Street, Great George Place, Great George Street, St. James Place, Park Place and Park Road, or while in any street, highway or road to which the public have access within the city between the above streets, highways or roads, and the boundaries of the Mersey Dock Estate.

The area within which vehicles are outside the operation of the Act is that situated in the lower part of the city and adjoining the Mersey Docks and Harbour Board. The streets within the area are well lighted, and no difficulties are anticipated, as the bye-laws have previously excluded slow-going vehicles from their operation as regards the carrying of lights. So far as the exclusion of the light from vehicles carrying cotton is concerned, this does not greatly affect the question, as the carriage of such goods is almost entirely confined to the area indicated by the streets we have mentioned.

Many Councils, of which that at Luton may be regarded as typical, have not made exemption orders, from the feeling that, as the intention of the Legislature undoubtedly was to secure uniformity as to the lights which vehicles should carry, it was undesirable to destroy that uniformity by setting up local exemptions. Further, where a large section of their areas was of the rural or urban character, they have recognised that harvesting vehicles without lights on highways are no less a nuisance than others; hence the general endorsement of the Act as adopted at Westminster that we have noted. No special orders in connection with the Act have been issued in Richmond and Swindon, but in other places the matter is having the attention of the authorities. It is at the present time under consideration at Coventry, and also at Newcastle-on-Tyne, where new bye-laws are awaiting the final sanction of the City Council. The owners of vehicles in the City of Leeds (which has submitted a new bye-law on the subject to the Home Office) are almost unanimously adopting a white front and a red rear light.

During the last few days an important development has occurred in connection with this matter, and the whole question of local exemption is now under the consideration of the Municipal Corporations Association, with a view to framing regulations in concert with the County Councils Association so that the uniformity which all practical persons recognise as so desirable shall be secured. As yet, however, no definite recommendation has been made, and doubtless the experience of those places where new regulations are made will be watched very closely with a view to securing a satisfactory policy all round.

A MOTOR-BUS service is shortly to be started in the town of Petropolis, Brazil.

At the twenty-sixth annual general meeting of the Institute of British Carriage Manufacturers, held on the 23rd ult. in London, Mr. Sydney Norris, of Manchester, was elected president.

THE employees of Chambers Motors, Ltd., were, through the generosity of the firm, given a day's excursion from Belfast to Dublin in order to visit the Irish Automobile Exhibition.

THE Mayor of Brighton, in fining a motorist 50s. and costs for driving at a dangerous speed, has expressed a view that the magistrates intend to put a stop to such proceedings in the roads of that town.

MESSRS. JONES AND CO., whose garage is as much a feature of Lichfield as is the house of Dr. Johnson, have issued a series of route maps to Bournemouth, Newcastle-on-Tyne, London, Edinburgh, and Glasgow. These are given to motorists calling at their place.

MR. H. S. CAUTLEY, the prospective Parliamentary candidate for the East Grinstead Division of Sussex, is already receiving letters asking his views as to the motor-car question. Replying to a local farmer he says he agrees that motor-cars "are a luxury, and that they ought to be further taxed."

"INDIAN MOTORS, LTD.," has been registered in Calcutta, and arrangements have been made with the Bombay Motor Car Company to take over the representation of Daimler and Fiat cars in Bengal, while a new feature of the business will be the importation of commercial vehicles. These have hitherto only been seen in India in an experimental way, and there can be no doubt as to the large opening there is for industrial enterprise in this direction.

To Londonderry belongs the distinction of possessing the first motor fire engine in Ireland, the enterprising town authorities having purchased a Merryweather motor "Fire King" steamer, which was delivered last week. The engine has a pumping capacity of 400 gallons per minute, and can travel at a speed of twenty to thirty miles an hour on the level. The boiler is fired with oil fuel, the water being kept hot in the fire station by means of a gas burner, which enables the machine to turn out within one minute from receipt of a call.

AN important decision affecting the liability of local authorities to keep their roads in proper repair was given by Judge Gye in the Basingstoke County Court recently. The Farnham Rural District Council brought an action against Messrs. Mussellwhite and Sapp, builders and contractors, of Basingstoke, to recover the sum of £48 alleged to have been extraordinary expenditure on the repair of a road at Hindhead which had been damaged by the defendants' traction engines. His Honour gave judgment for the defendants, with costs on the higher scale.

THE fire which occurred a few days ago at the garage of Mr. Milton Bode, the well-known theatrical proprietor, destroyed all the woodwork of his new Ariel limousine—a fine body made by Mr. William Vincent, of Castle Street, Reading. He will not, however, be without a car for a few days, as Mr. Vincent is just completing a handsome side entrance touring body for Mr. Bode's Panhard chassis. The body that was burnt was almost identical (except as to the colour scheme) with that shown by the firm at the Cordingley motor exhibition at the Agricultural Hall last March.

DURING the progress of the South Herefordshire election the motor-car is, of course, playing its part. Unhappily for one of the candidates, an automobile containing speakers recently broke down at a secluded village on the way to a meeting of considerable importance. Some of his opponents were more punctual at the gathering, and, seeing that the motor-car did not bring its contingent of speakers, they took advantage of the occasion to address the meeting and to secure a vote of confidence being adopted in favour of the candidate against whose interests the meeting was called.

HERE AND THERE.

MESSRS. MORGAN AND CO., LTD., have facilities for the re-charging of accumulators and the repair of motor tyres at their place at Leighton Buzzard.

THE decrease in receipts of the Brighton and South Coast

Railway Company during 1907 has been officially attributed as due, among other causes, to the competition of motor-vehicles.

MR. T. WILSON, the Master of the Burton Foxhounds for the last twenty years, has become a motorist, having ordered a 42-h.p. Hampton limousine car from the Daimler Company.

WE illustrate herewith one of the Star Engineering Co.'s latest 12-h.p. four-cylinder cars, fitted with a special detachable back portion, side entrance body, and a Cape cart hood, which can be used on the vehicle either as a double extension hood for a side entrance car or as a single hood with the side curtains attached. One of the pictures shows the back portion of the hood down ready for detaching the back portion of the body. The front part of the hood can be removed to the back of the

body the same as the usual double extension hood, and folds down on the rear portion of the body in the ordinary way. The main feature of the hood is that while it is of the double extension variety, it can be used as a single hood for a two-seated car, or the front portion can be employed to close the back part of the hood entirely by the partition behind the forward seat. We may add that the Star Company are in a position to fit hoods to any make of car.

MR. R. L. JEFFERSON'S adventures on mountain and veldt on a Rover car are described in an interesting illustrated pamphlet just published by the Rover Company, Ltd., of Coventry. The way in which the 8-h.p. machine carried the traveller over the Great Karroo is a fine tribute to the car.

MESSRS. S. F. EDGE, LTD., have sent us particulars of a Napier 10-h.p. two-cylinder motor-car that is about to be put on the market. The chassis has an 8 ft. wheel-base, turning circle diameter of 25 ft., and width of frame of 2 ft. 4 in. The engine has two cylinders, 3½ in. bore, magneto ignition, with forced lubrication, and water circulated by a pump. The gear-box is adapted to give three speeds and reverse with direct drive on top speed. Wire wheels are to be fitted with ball-bearing hubs.

LORD DUNLEATH, of Ballywalter Park, County Down, has just bought a 15-h.p. Coventry-Humber.

THE Commons Preservation Society intend to oppose the suggested London to Windsor motor road service.

A COURSE of lectures in automobile engineering is being given in connection with the University of Sheffield.

WE are informed that two Humber cars have been awarded gold medals in the Reliability Trials of the Automobile Club of Victoria.

THE DAIMLER COMPANY have received an order from H.H. the Sultan of Zanzibar for a 42-h.p. Daimler chassis which is to be fitted with a Pullman limousine body.

"WILLING'S PRESS GUIDE" has now attained the dignity of the thirty-fifth annual issue. Its information with reference to newspapers is both comprehensive and reliable.

M. THERY, who, it is reported, will again drive a Brasier car in this year's A.C.F. Grand Prix race, is carrying on a business at Levallois-Perret, near Paris, devoted to the hiring out of taximeter motor vehicles.

MESSRS. BARNETT'S MOTORS, LTD., Bristol Street, Birmingham, who are agents for Renault and Austin cars, have just received an order for a 20-h.p. Hispano-Suiza, fitted with all the latest refinements of body work.

DONNYBROOK, the celebrated village near Dublin, has now its garage and motor repair establishment, Mr. W. Ladley, who has conducted a motor business at Morehampton Road, Dublin, for some years, having installed himself in Donnybrook.

A Steam Coach built by F. Hill in 1840.

THE annual banquet of the Automobile Club of America was held in New York on the 25th ult. In appreciation of France being the cradle of the motor-car, the guest of honour was the French Ambassador, M. Jules Tisserand, while other speakers included Senator Chauncey M. Depew.

MR. J. V. AIKIN, the proprietor of the Didsbury Motor Works and Garage in Albert Street, Didsbury, Manchester, has been compelled to extend his premises in order to cope with the demand for motor-car accommodation in the district. In addition to the ordinary garage work Mr. Aikin undertakes the sale and repair of cars and accessories.

FROM the City Ignition Company, of 14, Spencer Street, London, E.C., comes a copy of their latest price list of motor accessories and fittings. Among the specialities that may be mentioned are the Malcolm high-tension distributor and contact breaker, the Cicoy induction coils, the Voltoo two-volt coil, accumulators, voltmeters, sparking plugs, horns, lamps, &c.

THE Parsons Non-skid Company have put on the market a whistle blown by compressed gas from one of their Sparklet inflator cylinders, which is admirably suited for a burglar or fire alarm for country houses. It gives an exceedingly penetrating scream which can be heard for several miles, and can be operated by simply depressing a lever. The cylinders can be relied upon to contain the gas for any length of time, and each one is capable of about 250 full blasts of one second duration. As burglary by motor-car appears to be becoming a fashionable occupation, it is well that a firm engaged in the supply of motor accessories should take steps to ensure protection.

MORE than a score of entries have been received for the trials to be held this month by the Bombay Motor Union.

A NEW garage is being opened by Mr. G. A. Spencer at 45, Alexandra Street, in the centre of the town of Southend.

MESSRS. A. AND C. BRIDGLAND, LTD., have a motor garage at 33 and 35, London Road, East Grinstead, where motor accessories and petrol can also be obtained.

"TOWN PLANNING IN THEORY AND PRACTICE" is the title of an interesting book issued by the Garden City Association, 602-3, Birkbeck Bank Chambers, Holborn, W.C.

MESSRS. WALKER BROS., LTD., of the Pagefield Ironworks, Wigan, have taken up the construction of industrial motor vehicles, and have just introduced a 16-18-h.p. two-cylinder two-ton delivery van.

MR. DOUGLAS S. COX, of West Norwood, has sent us a photograph of the Osterfield 40-h.p. eight-cylinder car which has just been completed. Unfortunately the picture, owing to it being too dark, does not lend itself to reproduction.

MESSRS. REID AND EVANS have a well-equipped garage and works in the New North Road, Exeter. They keep a car for towing vehicles that have broken down, and have a special plant for charging accumulators. Free tuition in driving is given to their clients.

LIEUTENANT PAUL GRAETZ, who is making the journey by motor-car across Africa from Dar-es-Salaam, German East Africa, to Swakopmund, German West Africa, has now reached Bismarckburg, at the southern end of Lake Tanganyika, about 1,100 miles from his start.

THE Semperit Tyre Company, of 2, Hans Road, Brompton Road, S.W., send a neat price list of their "Semperit" motor tyres and of a steel-studded non-skid pneumatic tyre without leather bands, which has a good appearance, and is claimed to be both reliable and durable. It has attained considerable reputation on the Continent, and its progress in this country will be regarded with interest.

FROM the Gordon Carriage Works, of 47, Harders Road, Peckham, S.E., come several improvements in connection with wind screens, luggage carriers, hoods, &c. The Gordon Cape Cart Hood is readily detached and placed in position and presents a good appearance on the car. The Wind Screen turns upon a disc allowing it to be adjusted to any one of seven machines. The upper half can be folded inwards to minimise the resistance, and also to allow the driver a clear view ahead in rainy weather. Those in search of improved forms of hoods and screens will find the Gordon Carriage Works well able to meet their requirements.

A DEPOSIT of £250 has been made with the Brooklands A.R.C. by Mr. S. F. Edge, accompanied with a challenge to M. Rene de Knyff to race either one, two, or three Panhard cars against either one, two, or three Napier cars. He suggests that no stakes should be put up by M. de Knyff, and that the cars should comply with the regulations of the Grand Prix, 1908, with the amplification of the rule allowing detachable rims, so that detachable wheels may be used and changed during the race. The distance suggested is one to four hundred miles on the Brooklands track between June 15th and July 20th of the present year. M. de Knyff has replied stating that his company has no intention of accepting the challenge, but if Mr. Edge wishes to race against the Panhard cars he can enter for the Grand Prix de l'A.C.F.

A SPLENDID catalogue of motor clothing and accessories has been issued from Automobilia Ltd., of 532, Oxford Street, London, W., one of the most centrally situated motor establishments in the metropolis. The selection of clothing both for lady and gentlemen motorists is fashionable as well as utilitarian. In the latter section are some good styles of leather liveries, &c., for chauffeurs, a department in which the firm have specialised to the advantage of their clients. The lamp section is complete with head lights, side lamps and some good types of electric lamps calculated to save motorists from the worries often associated with such accessories. Motor horns and sirens and electric sundries of every description, speedometers, motor jacks, tyre gauges, &c., make up a very comprehensive work of reference.

Correspondence.

[Letters to the Editor should be addressed to the offices, 47-53, Charing Cross Road, London, W.C.]

THE ALDEN SAMPSON PETROL ELECTRIC ROAD TRAIN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have noted with interest and appreciation the excellent article upon our road train in your issue of December 28th, 1907. Although we consider your notice one of the clearest descriptions of the train which we have yet seen, we trust you will pardon the following. It is not made clear that the springs are pivotally suspended, thus acting as equalising beams to always retain the proportionate loading of each axle regardless of the road surface, and that they could be replaced by simple beams should a springless truck be desired. Their attachment to the axles is such as to enable them to retain the axles in correct crosswise position under the bodies, the springs being free to move endwise on the axles, the latter being held fore and aft by radius rods. Any portion of the load can thus be permanently carried on any axle by locating the pivotal point of the springs as desired.

The flexibility of the electric drive and the complete reversibility of each car has, as was anticipated in the design, proved to be not only of great advantage, but an absolute necessity in a train of this kind. We were lately compelled to load the train at the end of a long crooked alley, which had a gate rail preventing the tractor from

land, and the great number and diversity of interests which realise that a train of this kind is to supply a long-needed economy in their freight handling is very gratifying.—Yours truly,

For the Alden Sampson Manufacturing Company,

P. H. BREED.

Pittsfield, Mass., U.S.A.

THE RULES OF THE A.C.F. GRAND PRIX RACE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I enclose you copy of a letter which I have addressed to the Secretary of the Automobile Club of France. The rule I refer to is couched in the following words, according to the translation issued in the "Club Journal"—"Article 4. Manufacturers making use of engines or mechanical construction in accordance with the same patent or under the same designation into which the same name enters, are not permitted to enter together a number of cars in excess of three. In the event of a misunderstanding between firms manufacturing cars that use the engine or mechanical construction (presumed correct translation of "appliances," D.M.W.) in accordance with the same patent, the Competitive Committee shall decide the number of cars to which each firm is entitled. The decision to be based upon the importance of each firm,

The Alden Sampson Petrol-Electric Road Train making a sharp turn.

entering and which had no place to turn. The tractor was left in the street, and, with power supplied through long cables provided for the purpose, the cars were run into the alley, steered by hand, and after being loaded, and with steering tongues reversed, were run out again in the same manner.

In the same way any number of cars could be loaded at different points of a yard, and when ready placed in the train behind the tractor by their own motors, an advantage not obtained by any mechanical drive.

As an example of how evenly distributed the torque is through our train, the writer has been able to go between the cars and pull any one of the draw pins while the train was climbing an eleven per cent. grade under load. In another case the train pushes or pulls each car over a high kerb, which would effectually stop any car operating alone. The tracking of the train is most interesting, each car following almost exactly in the tracks of the one ahead of it; due to this fact, any corner or turning which can be negotiated by an automobile of six feet wheel-base can be made by the entire train. The steering is as easy as any five-ton truck and the control perfectly simple, one man operating the entire train with ease. We are not in a position as yet to give actual running costs of the train, as since returning from New York the severity of a New England winter has made it difficult to get any but the most abnormal tests, but we hope to be allowed an opportunity to put before your readers at a later date more data and interesting developments in the operation of the trains.

The train is exciting a great deal of genuine interest, and every mail brings us inquiries from all parts of the United States and from Eng-

land, taking into account the number of cars delivered to the public in the course of the preceding three years, and whatever the number of manufacturers may be there shall be no inconsistency with the second paragraph with the present article."

I think that the justice of my letter will be obvious to your readers without my commenting thereon.—Yours truly,

D. M. WEIGEL.

21st January, 1908.

The Automobile Club de France,
8, Place de la Concorde, Paris.

Gentlemen,

We have duly received a translation of the rules covering the Grand Prix Race from the Royal Automobile Club, and would ask you to be good enough to favour us with an explanation of Rule 4, as it is couched in such drastic terms that we consider it would be futile for us to go to the large expense of building racing cars and paying our entrance fees if this rule is drastically enforced upon the lines indicated by it. Your committee must be well aware that there are several patents claimed by various firms which other firms are using and not admitting the validity of. As examples, we would point out to you that to the best of our belief we may say this company claims a patent for the Beehive radiator. They also claim one for the Gate change.

The Renault Company, we believe, claim a patent for the direct drive on top speed, and, in fact, practically every part of a motor-car is claimed as a patent by one firm or another.

We know that many firms in the trade do not admit the validity of the greater number of these patents, in fact I may say practically all of them of any importance, and I would suggest that the question as to the validity of that patent or not is one that should be dealt with by a court of justice and not by your committee.

If, on presenting ourselves to take part in the race, your committee constitute themselves as legal judges, they might be doing an injustice either to the patentees or that firm which denies the validity of the patent. I certainly think that the rule is one that is likely to cause a large amount of friction and is of so speculative a nature that if it is to be exercised upon the lines that are suggested, your committee is entitled to insist upon it, and I for one would strongly advise my directors not to take the risk of spending a large amount of money in speculating as to whether they might or might not be permitted to take part in the race upon such terms as this.

The favour of a reply will oblige.—Faithfully yours,

D. M. WEIGEL.

Mr. Weigel has since received the following letter from M. R. de Knyff, the President of the Sporting Commission of the A.C.F.

I have received your letter of the 21st inst., and I hasten to reply to your enquiries. Article 4 of the rules of the Grand Prix of the A.C.F., 1908, which you mention, does not open up the question of patents, with which the Sporting Committee has no intention of interfering, it is simply to prevent affiliated firms from profiting by such circumstances to have six cars instead of three entered, and thereby obtain an advantage either in the race or in the advertisement that such firm might have. As an example: Messrs. Lorraine-Dietrich and Messrs. Turcat-Mery construct cars under the same licence. In the event of both these firms taking part in the Grand Prix they would only

The 60-h.p. Six-Cylinder Napier recently supplied to His Highness Jai Singh Bahadur, Maharajah of Alwar.

The Maharajah is only twenty-six years of age, but is a keen sportsman and is given to making long tours of inspection in his extensive territory. The body is of a special detachable-top limousine type, the front part being entirely enclosed. Accommodation is provided at the rear for six passengers, and for two alongside the driver, the body being much wider than is usual. The upholstery is in light blue brocade, with curtains and arm-straps to match. The roof is also of a delicate blue-embossed material, tastefully ornamented, and clusters of electric lights mounted in brass holders give an artistic effect. The exterior painting is a light shade of blue with vertical white stripes.

be entitled to enter three cars between them. We trust that this information will suffice for you to understand the essence of the rule.

Apart from this, the suggestions contained in your letter lead me to believe that we are in accord.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The rule of the French authorities prohibiting the changing of wheels in the Grand Prix race of 1908 is generally taken to exclude the use of the Rudge-Whitworth detachable wire wheel from that contest, but we believe it is more probable that the intention is to exclude the replacement along with the wheels of bearings and brake drums, the strain and wear on which in a race of this description is very severe, and the replacement of these parts ought not to be permitted, because it would not tend to the betterment of the motor-car.

We are urging the R.A.C. to use their great influence in presenting this view of the matter to the French racing authority, and to obtain from them a definite ruling as to whether the detachable wheel, which does what the detachable rim does, only at less expense of time and weight, will be permitted or whether it will be excluded. If the ruling obtained permits the detachable wheel, then these will undoubtedly be largely represented. If, on the other hand, the detachable wheel is excluded, it can only be on one of two grounds. First, that in the event of a broken wheel a new one could be fitted and the car could proceed, while with a detachable rim the car would be permanently disabled. Second, that the detachable wire wheel offers advantages that may be regarded as an unfair handicap to the cars fitted with detachable rims only. The first possibility may be dismissed with the

remark that a car breaking a wheel at modern racing speeds would inevitably be wrecked, and the replacement of a wheel would be purposeless. The second possibility is the more serious, and there is no doubt that a detachable wheel, because it has only one nut as against at least six of the detachable rim, can be replaced in far less time, and therefore does undoubtedly form a handicap of a serious nature against cars with detachable rims.

But does this serious handicap form a sound and sufficient reason for the prohibition of a device that is a recognised equipment of a touring car, and not a mere adventitious aid to racing? An examination of the history of motor racing in its tyre changing aspect is necessary to the proper understanding of this question. At first the men on the car carried spare tyres and changed them as best they could, taking from seven minutes to twenty minutes according to tightness of the cover and the fatigue of the drivers. Later gangs of men with spare tyres were stationed at various points on the course, and whenever a stop was made for any purpose whatever, all four tyres, irrespective of condition, were cut in two, torn off, and fresh ones fitted. This was later prohibited as adding unnecessarily to the expense and because it was held undesirable in a contest promoted for the development and perfecting of the motor-car.

In the Gordon Bennett of 1906 the Renault and F.I.A.T. cars were equipped with detachable rims that enabled a tyre to be changed in five minutes without the fatigue that attended the fitting of a fresh cover. The result was Renault first, F.I.A.T. second, and there were no protests against their use, although at each change they saved the car so equipped some five minutes of delay and much fatigue, and although at that time they were by no means a recognised feature of touring cars. The Rudge-Whitworth detachable wire wheel was used in racing in the Tourist Trophy race of 1907 and in almost every race and time trial held at Brooklands, and also in some few races on the Continent, notably on the Aries cars, while in addition they have been fitted to privately-owned motor-cars of a great variety of makes with such results that they are unquestionably a recognised feature of the English motor-car of the present day.

On these grounds we regard their prohibition in this race as quite contrary to the precedents established in the past, and for this reason we have every confidence that the case, when vigorously presented and pressed by the R.A.C., is bound to result in an interpretation of the rule which will permit the use in the Grand Prix race of detachable wire wheels.—Yours truly,

RUDGE WHITWORTH, LTD.

SOME NOTES ON RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reading your journal of the 18th ult., particularly the article by your contributor, Mr. E. T. Humphries, I notice he says that "the idea of the radiator was taken from the steam engine condenser. . . . In the motor-car its functions are to cool the water, which is inside the pipes, and the air on the exterior with a fan, &c. . . . while with the steam engine the steam is inside the pipes and the water outside and used as an agent for cooling purposes."

May I suggest that this statement or affirmation is somewhat erroneous and misleading, the fact being that the water (the cooling agent, the sea in the marine engine) is inside the pipe and the steam from the induction pipe or main exhaust plays upon the exterior surface of the pipes. My object in writing this brief criticism is that other readers not well versed in steam engine principles may not be misled from wrong facts.—Yours truly,

ENGINEER.

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As to valve timing and the use of "Larrad's" timer, "Interested Enquirer" has no doubt drawn attention to a point in the instrument which may reasonably be argued to be a weak one, in that all engines are set alike. I ought to have mentioned, however, that the makers have anticipated this objection by making in addition an instrument divided into degrees and tenths, so that each cylinder may be timed differently if the user so desires. It is this form I am now using. In answer to Capt. Windham I have found the best place to attach it is the rim of the flywheel, if necessary by a special fitting, as the larger the circle upon which it turns the greater the possible accuracy.—Yours truly,

AMATEUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As "Interested Enquirer" has apparently never handled the Larrad Timer, we would suggest that the only conclusive way out of the difficulty is by personal experiment. He fails to see how a spirit level can be claimed to be absolutely accurate; again we suggest experimenting with a level with and without a cigarette paper under one end and the old story of egotism will vanish. Needless to say we did not put this instrument on the market without experimenting with all types of engines. Your correspondent in his last letter states that he is convinced that from practical experience high and low speed engines should have different settings of the valves, yet in his previous letter he says it would be

interesting to know if Panhards have tried the Minerva position; surely he has increased his knowledge in a week. Continuing, he says, given two engines of the same make and exactly alike in every particular, one will sometimes be found to run better with a different timing to the other; this means if two engines are equal in every other respect except power putting the valves unequal will make them equal. We can assure him, however, that the fault is elsewhere; but if he is convinced that he is right, will he bring the two engines he refers to to our works, where we will prove to him that he is wrong? Your correspondent has been lucky in his choice of shops for viewing cams; if they all were as true as those, silence would reign.—Yours truly for

LARRAD'S PATENTS SYNDICATE.
H. PULHAM.

CHARGING ACCUMULATORS FROM DYNAMOS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have fixed a little dynamo for the purpose of charging my ignition accumulators; it gives 1 to 1½ amperes at 40 volts pressure at a speed of 3,000 r.p.m. I should be glad if you could inform me what is the best kind of resistance and the most effective way to proceed.—Yours truly,

ENQUIRER.

[In order to make the dynamo suitable for charging from two to eight 4-volt accumulators, it will be necessary for "Enquirer" to provide a resistance frame with coils of German silver or platinoïd wire having

rate most grades of it now generally supplied, so heavy that it will not vaporise in January like it does in June without some external assistance, hence the necessity of the jacket. The latter is usually placed round either the mixing chamber or the throttle, and if it is anything of a jacket it should become nice and hot after the engine has been running about ten minutes. There is another reason for having a jacket, and it is this: when an engine is "ticking" like the proverbial clock, consequently taking in a pretty rich mixture, a good deal of petrol will collect in the inlet pipe with rather curious results. Sometimes the engine will, after quietly ticking away for a minute or so, suddenly, without anything being touched, break away and race for nearly half a minute. This is one of the results of "petrol in suspension," as it is technically termed, and another unpleasant result is the sudden choking or "fagging" of the engine when the throttle is opened. Now all this is avoided by the use of a good jacket, as the mixing chamber and throttle chamber and inlet pipe are all raised to a fairly good temperature by the heat of the jacket and all superfluous petrol is vaporised. It has to be borne in mind, however, that a jacket requires attention; it is liable in the case of hot-air jackets from the exhaust to become clogged, and naturally it then ceases to become a jacket. It is possible that in the hot weather the jacket may be superfluous, or even cause too much heat, but this is easily remedied. The jackets are usually arranged to work from the exhaust, and very often a tap is fitted so that the exhaust can be cut off; if not, it is no difficult matter to disconnect the pipe.

In the writer's opinion the best way to detect the causes of uneven running is to make use of the exhaust "cut-out."

The Fleet of eight Delivery Vans employed by the Proprietors of the "Sheffield Telegraph" for the rapid delivery of newspapers. The vehicles—the number of which is shortly to be increased to ten—are of 12-h.p.; they are built to carry up to 10 cwt., and it will be noticed that the body is roomy and low to avoid danger of skidding and overturning.

a resistance of 20 ohms. It takes 5 volts to charge a 4-volt accumulator, so with a total pressure of 40 volts our correspondent has enough power to charge eight accumulators of 4 volts each in series. When he wishes to charge a less number it will be necessary to put in resistance to absorb the extra volts, unless the speed of the dynamo can be reduced.

Assuming that at least two 4-volt accumulators are charged at one time, these will absorb 10 volts, leaving 30 volts to be used up in the resistance, and with a current of 1½ amperes required the amount of resistance should by Ohm's law be 20 ohms. As the voltage of the accumulators being charged varies, exact figures cannot be given, but a variable resistance of this range will allow ample regulation if an ampere meter is used in the circuit as a guide to what is passing. The resistance frame can be obtained from a firm of electricians, or it can be constructed roughly with the necessary coils of wire and connected up to a multiple contact switch or a brass sliding sleeve.]

SOME WINTER MOTORING TIPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I frequently hear complaints about the uneven running of cars, and no particular fault can be discovered. The subject is an interesting one. Just about this time of the year the weather in England is most changeable, and motor spirit now is not what it used to be, it is much heavier and requires more vaporising. Let us turn our attention to the carburettor. In the writer's opinion every carburettor for use in England should be either hot-air or hot-water jacketed; petrol, or at any

A weak cylinder is at once detected, and the particular cylinder may easily be located; if there is one faulty cylinder amongst the four, that is quite enough to upset even running, more particularly when running slow or top speed. Badly timed valves are frequently the cause of a "lame" cylinder, and quite recently I came across a car which fired badly on one cylinder, though the other three were perfect; when running quite slow the faulty one would go out altogether. The compression was perfect and the ignition (two systems) also, but careful inspection revealed the interesting fact that the inlet valve was opening nearly an eighth of an inch down the suction stroke and closing nearly one eighth before it reached the bottom. The tappets on this car were adjustable, and after reducing the clearance (nearly three sixteenths of an inch) between the tappet and the valve so as to correct the timing, this cylinder ran perfectly and just as well as the other three. Inaccurate timing of the exhaust valves can cause just the same trouble.

One last little hint—also discovered by experience—because your drip lubricator appears to be working all right, just make sure that all four cylinders are being lubricated; if one gets starved, although it may pick up some oil by "splash" it will go much better if its cylinder walls are being lubricated the same as its fellows.—Yours truly,

AN OLD HAND.

A DERBYSHIRE motorist writes regretting the refusal of the Derbyshire County Council to adopt the recommendation of its Bridges and Highways Committee to erect warning signposts. This is much deplored by motorists resident in the county, as there are many dangerous cross roads within their area.

SOME FEATURES OF 1908 ENGINES.*

By G. H. BAILLIE:

THE features of this year's engines, about which I have collected information, are those of details that are apt to escape notice rather than those of the more striking novelties; such as the valveless engine, which everyone hears of and examines for himself. Engines generally are approaching more and more to one or two standard types, but in their details there are many points which show no tendency to standardise themselves. One of the most fundamental points of an engine is the shape of the cylinder, or the ratio of its stroke to bore, and about this there exists the widest divergence of opinion. The ratio varies from 0.73 in the Bollée and 0.75 in the 28-h.p. Lanchester to 1.67 in the 10-14-h.p. Renault, and 1.60 in the 10-14-h.p. La Buire. The average ratios diminish as the horse-powers increase. The variations in each case are very considerable between the different makers, and even the same maker seems to have formed a definite conclusion in only quite a few cases. Fiat, for instance, keeps more or less to a ratio of 1.2 for all sizes, while Bollée keeps to about 0.8. A large number of makers retain the same stroke for several sizes, which makes the ratio decrease with increase of horse-power, but this may be for reasons connected with machine tools and jigs rather than with the properties of engines. Several old makers, such as Mors and Darracq, appear to have no settled convictions on the subject.

Making a comparison between two engines having the extreme ratios, 0.73 and 1.67, the same bore has been taken, and the same piston speed, so that the rate of consumption of fuel is identical, the rate of flow of gas during induction and exhaust being the same in the two cases. The bore being the same, the maximum pressure on the piston

Three of the Brasier Motor-Cabs which have lately been put in service in Bordeaux.

and the connecting-rod and its bearings is alike, so that the weights of the reciprocating parts can be the same, the inertia force the same, and the frictional resistance more or less the same. There is, in fact, no salient point to say that the horse-power of the one engine would be greater than that of the other. Moreover, the two rating formulæ adopted by the R.A.C. and the A.C.F. would allot them the same horse-power, since both depend on the bore only.

Now, the A.C.F., before adopting a rating formula, made a series of measurements to determine the maximum horse-power of ninety-six different engines, and these measurements throw some light on the effect of different ratios. In a diagram of a number of curves, referring to four-cylinder engines of the same bore, the ordinates representing the maximum horse-power obtainable from the engine and the abscissæ the ratio of stroke to bore, practically all the curves tend downwards, showing that the power diminishes as the ratio increases, or that a short-stroke engine gives more power than a long one. The reason of this decrease of power with increase of stroke is probably that the time of the expansion stroke in the long-stroke engine is longer, and the cooling of the gases greater. As the loss of heat to the cylinder walls is the principal loss in a gas engine, the difference in efficiency from greater opportunity for cooling might well be considerable. The only difference apparent is that the torsional movement on the shaft is greater in the long-stroke engine than in the short, which means that a larger shaft is needed. The difference is not great, as the bending movement remains the same, but what difference there is in favour of the short-stroke engine. Moreover, the higher speed of rotation of the short-stroke engine is an advantage from the point of view of the fly-wheel, and the clutch, and other transmission mechanism.

So far everything points to a short-stroke engine being the better, but there must, of course, be a limit, and a limit is in fact indicated in the few curves which extend to small ratios. The limit is probably

determined by the cooling of the gases. For any design of cylinder there is a given ratio of stroke to bore which will give the minimum cooling surface for a given volume of gases. This ratio is generally well over one, so that as the ratio is diminished the cooling increases, because the cooling surface increases and at the same time diminishes because the time of cooling decreases. At a certain point will come the happy mean which should give maximum horse-power. There are several minor considerations which depend to some extent on the shape of the cylinder, but these are not sufficient to account for the very different shapes that exist in practice.

Coming now to the more visible characteristics of this year's engines one finds two very marked tendencies, the increase in six-cylinder engines and the increase in casting cylinders *en bloc*. Out of 144 makers sixty-nine build six-cylinder engines. It has been stated that there are over 120 different six-cylinder engines, but that number must include engines of different sizes by the same maker. By far the greatest number of makers cast the cylinders in pairs, and the number now casting them in blocks of four is nearly equal to the number casting separately. The figures are:—

Makers casting cylinders separately	34
Makers casting cylinders in pairs	88
Makers casting cylinders in blocks of three	4
Makers casting cylinders in blocks of four	29
Makers casting cylinders in blocks of six	2

The number casting in blocks of four is rather striking, as I can recall only one engine so cast at the 1906 show. Rolls-Royce started casting in blocks of three for a six-cylinder engine, and this year has been followed by Delaunay-Belleville and La Buire. The O.U.R.S. said to be the only three-cylinder engine at the Paris Show, is also cast in a block. The two makers who go the length of casting six cylinders in a block are Miesse and Beatrix.

Without entering upon the old question of the relative merit of cylinders cast separately or in pairs, the latter have two advantages; first, piping that is simpler and less effective; secondly, a shorter engine, if the crank shaft be allowed two throws without an intermediate bearing. But this arrangement brings one to the limit as regards shortness if plain bearings be used. There is, as a rule, no length wasted in the crank-shaft. Consequently, though the cylinders may be brought closer together by casting in blocks of four or six, the engine can be shortened only by sacrificing bearing surface or by the use of ball bearings. The two six-cylinder engines cast in a block, Miesse and Beatrix, both use ball bearings on the crank-shaft, and the engines are no longer than most four-cylinder engines of the same power. Several of the engines with four cylinders in a block also use ball bearings. Others, such as Aster and Unic, have only two bearings, one at each end. This, probably, is quite sound practice up to a certain small limit of power; beyond this the difficulty of providing a sufficiently strong shaft would be considerable.

The number of examples of *en bloc* casting now existing show that there is no real difficulty in the actual casting, and there can be no question that if it be practicable to shorten in this way the large-powered four, and more especially the six-cylinder engines, the advantage gained would be very material—there would be so much more room between the axles, i.e., in the right place, for the body. The question, however, seems to be bound up with that of ball-bearing crank shafts. Now that two makers—Mercedes and Hotchkiss—appear to have given up their use after extended trial, one feels inclined to suppose that they must offer insuperable objections. On the other hand, the makers adopting ball bearings are continually increasing, and it will be interesting to watch the fate of the many ball-bearing crank shafts now existing.

I gather that Miesse uses ball bearings only when he must, for his six-cylinder engine has the two outside bearings plain, and the next two from each end ball, while the two centre throws are without an intermediate bearing. There are thus two plain and four ball bearings on the shaft. The horizontal engine is becoming more and more scarce. All I found were N.E.C., a four-cylinder engine with cylinders opposed two and two; Pilgrim, and James and Browne, four cylinders side by side; Buick, two opposed cylinders; and Cadillac and Adams, with single cylinders. From the carriage point of view, there is no doubt that the horizontal engine in larger powers, as in the N.E.C. and Pilgrim, does offer very material advantages. The V-type engine has only two followers outside bicycle engines—the Antoinette eight-cylinder and the Riley two-cylinder.

The commonest type of engine has its valves arranged in chambers on each side. Sixty per cent. have this arrangement and 40 per cent. have their valves side by side in a single chamber. Other valve arrangements are becoming increasingly rare. There are five with the inlet valve vertically over the exhaust valve. Two, with the inlet valve in the centre of the engine head and the exhaust in a side chamber—Metallurgique and Motobloc. There is the Pipe alone with the two valves, one on each side, with their stems pointing upwards at an angle of 45 deg., and the Maudslay alone with all the valves in a line on the top of the cylinders. I think there can be no question that the Maudslay and Pipe arrangements, which avoid any side chamber to the compression space, must give the most efficient engine, but both constructions are more costly than the ordinary, and the Pipe is decidedly complex. On the other hand, the Maudslay type gives an engine extremely accessible in all its parts, and allows of doors in the crank chamber large enough for drawing a piston. It is difficult

* Abstract of paper read before the members of the Royal A.C. on January 23rd, 1908.

to see much advantage in having the inlet valve in the head or above the exhaust valve. It is a more complex construction, and the saving of cooling surface in the side chamber is small. The latter arrangement, however, is supposed to keep the exhaust valve cool by the inlet gases impinging on it.

The numbers of engines with valves in side chambers on the same and on opposite sides show that makers are fairly evenly divided in opinion on their relative merits. The valves together must make a rather more efficient engine, and only one cam shaft is needed. On the other hand, it is more troublesome to properly arrange the piping when exhaust and inlet pipes are together, and the carburettor is apt to make the valves difficult of access. Only one maker, Brasier, adopts this arrangement with low-tension ignition, and then a special cam shaft for the igniter tappets is employed. Exhaust, inlet and igniters have all been worked off a single cam shaft, but it makes a very cramped arrangement.

Nearly half the engines with valves together take the carburettor over to the other side. The Lancia engine has its inlet ports in the top of the valve chamber, thereby making the piping much neater. The Delaunay-Belleville saves considerably in length of piping by taking advantage of sufficient space between the two centre cylinders. The Gregoire and Hotchkiss, each with four cylinders cast in a block, have the inlet passages cast with the cylinders, and have a single port at the back. The Iris does the same thing for each pair of cylinders, the carburettor piping being bolted to the inlet ports at the back.

The piping and accessory apparatus belonging to engines must be one of the most awkward problems for the designer. Many of the solutions indicate clearly the difficulties he has struggled with and not overcome. The accessories are becoming more and more numerous, and it becomes increasingly difficult to fit them all satisfactorily. The full complement numbers seven, omitting self-starters—magneto, high or low tension distributor, water pump, oil pump, governor and fan; several engines indulge in all of them. It is generally the accessory apparatus that gives more trouble than all the rest of the car, and it is important that each item should be easily accessible, easily removable without disturbing other parts, and should not render the valves difficult of access. This is not difficult to arrange if each item has its own special shaft and gear wheel; but a multiplicity of shafts means a multiplicity of wearing parts, and a more expensive engine. What increases the difficulty is that each part is subject to certain limitations. The water pump is preferably at the end of a shaft, so that only one gland is needed. The magneto also must be at the end of a shaft, as no magneto that I know of is constructed with a through shaft. The oil pump, if it has to draw from a sump in the crank chamber, is preferably near the level of the oil in the sump. Commutators and H.T. distributors are usually so constructed as to be accessible only from one end, not from the side. Consequently, they cannot be fixed on the ordinary shafts running along the engine, unless the front is free of the radiator.

The 16-20-h.p. Hotchkiss, with four cylinders *en bloc*, is one of the neatest designs I have seen, and this neatness is all the more creditable as it has adopted the simplest arrangement of a single accessory shaft. All the ports and passages are formed in the casting, which has merely four holes, one for the exhaust pipe, one for the carburettor, and two for the water. An eccentric on the back end of the cam shaft drives the lubricator on the dash. The system may have its disadvantages in other directions, but there is no question as to its neatness, simplicity, and accessibility.

Of eighty-eight engines with two cam shafts only twelve are content with a single horizontal shaft for accessories. The Armstrong-Whitworth has its exhaust cam shaft and the magneto shaft which is driven off it continued to the front, and the water and oil pumps are on the ends of these two shafts under the radiator, accessible from the front. There is also a commutator on a vertical shaft. Of the other engines most take the shaft through the water pump. The Belsize, Minerva and O.T.A.V. avoid this, by having no pump, and the Maja by having the gear to the middle of the auxiliary from the middle of the cam shaft.

(To be concluded.)

A 12-16-H.P. Vauxhall car has recently been supplied by Vauxhall Motors, Ltd., to Admiral Sir John Fullerton.

THE MIDLAND RUBBER COMPANY, LTD., of Ryland Street, Birmingham, are adopting the principle of taking discarded tyres, covers or tubes in part payment for new ones.

MR. W. T. LORD has been using Shell spirit in India and travelled from Bombay to Calcutta at an average of twenty-three miles per gallon. His 14-16-h.p. Argyll is fitted with Dunlop tyres.

FROM the Simplex Motor Company, of 165, Fenchurch Street, E.C., we have received a very complete catalogue of the Simplex Stanhope car they are putting on the English market. This is an American-built vehicle of 10-h.p., its principal feature lying in the use of a horizontal single-cylinder 2-cycle valveless engine.

THE new "Ilo" oils being put on the market by Messrs. Easton and Melville are worth, at least, the close investigation of motorists. The oils are being blended by the well-known firm of Dick and Co. and are offered at prices which compare more than favourably with current figures. Messrs. Easton and Melville are prepared to submit "Ilo" to the closest investigation by practical motorists. A postcard to 85, Shaftesbury Avenue, London, W., will bring all details of the new oil by return.

THE AUTO-CYCLE TRIALS.

THE trials organised by the Auto-Cycle Union on Saturday were carried out in weather that was cold, dull, and misty. The roads throughout the entire route of 125 miles were covered with mud. The trials, which included the climbing of Dashwood Hill and Gore Hill (Amersham), started from Uxbridge at 9.20 a.m., and the course was to Banbury, via Wheatley, Islip, and Bletchington, and then back again through Bicester, Aylesbury, Berkhamsted, Chesham, Amersham, and Beaconsfield. There were twenty-six starters out of an entry of thirty-three, and of these only thirteen got through in accordance with the schedule times, while there are only four whose performances are likely to rank as non-stop runs. There were only five who failed to reach the summit of Dashwood Hill. The best time was credited to Miss Muriel Hind, who, on a 5-h.p. Rex, ascended the hill in 1 min. 14½ sec. Mr. F. W. Applebee, on a similar make of machine of the same horse-power, was second, with 1 min. 16 sec., while Mr. J. Marshall, whose mount was a 3½-h.p. Triumph, was third, his time being 1 min. 17.45 sec. Other creditable climbs were made by Mr. E. J. Browning (4-h.p. N.S.U.), Mr. G. Lee Evans (3½-h.p. Rex), and Mr. W. G. McMinnie (3½-h.p. Triumph).

The return journey was accomplished under equally trying conditions, the machines being thickly coated with mud. Fourteen only negotiated Gore Hill, Amersham, and again Miss Hind secured premier honours, her time of 1 min. 37.45 sec. ranking in point of view of merit with her previous climb. Mr. J. Marshall was second (1 min. 33.35 sec.), and Mr. F. W. Applebee (1 min. 39.15 sec.) third, the Dashwood order, therefore, being reversed in the case of these two riders. Mr. W. G. McMinnie (3½-h.p. Triumph) was fourth, with 1 min. 41.45 sec. Shortly after five o'clock the competitors began to arrive at the finishing garage, where the officials inspected the machines and received signed reports. The following were the thirteen riders who completed the course in

The enterprise of the Daimler Company in opening a Depot in Spain is having good results. The photo reproduced herewith shows the car of one of their Spanish customers, Senor Obregon, taken near his home in Santander.

schedule times: W. Smith (1½-h.p. La Motosacoche), G. L. Fletcher (2-h.p. Moto-Reve), J. Marshall (3½-h.p. Triumph), W. G. McMinnie (3½-h.p. Triumph), A. D. Draper (3-h.p. Triumph), F. W. Applebee (5-h.p. Rex), G. Lee Evans (3½-h.p. Rex), J. Stuart Shaw (5½-h.p. Phenomen), M. Geiger (6-h.p. N.S.U.), E. W. Brighten (2½-h.p. Ariel), H. Newey (3½-h.p. Lloyd), E. W. Haswell (N.S.U., with side car), and Miss Muriel Hind (5-h.p. Rex).

Of the above only Messrs. Marshall, McMinnie, Stuart Shaw, and Miss Muriel Hind are likely to be credited with non-stop runs, and in each instance the performances will have to be considered by the Executive Committee.

THE St. Vincent Motor Company, Ltd., North Street, Glasgow, have been appointed agents for Glasgow and the West of Scotland for the B.S.A. cars.

MR. W. S. LIDDIE writes that he has just completed a tour of 11,000 miles through Australia, New Zealand and Tasmania, and that Miraculum has carried him successfully through this without the slightest symptom of tyre trouble.

MR. P. R. LAMB has now joined Ariel Motors, Ltd., as their general travelling representative. Mr. Lamb has had many years' experience and fully comprehends the requirements of probable purchasers; he will consequently be able to give prospective customers practical information as to the type, power, &c., most suitable for each individual case.

CLUBS AND ASSOCIATIONS.

THE AFFILIATION QUESTION.

NEARLY forty clubs have now decided their policy with regard to the controversy raging as to affiliation with the central organisations. So far sixteen clubs, with an aggregate membership of 1,756, have decided to remain affiliated to both the R.A.C. and the M.U. during the current year; eleven, with an aggregate membership of 2,949, have agreed to associate with the R.A.C., and eleven others, with a membership of 1,365, will be affiliated with the M.U. Included in those that adhere to the R.A.C. are the Ladies', Scottish and Irish clubs, with memberships of 398, 1,004 and 514 respectively.

The voting by postal ballot of members of the Midland A.C. has again resulted in a dead heat—107 to 107.

The Cardiff M.C. is in favour of affiliation with the M.U. and the Auto-Cycle Union. The Commercial Motor Users' Association "proposes to retain its membership of the Motor Union, and does not intend to adopt the associates' scheme of the Royal A.C., nor is it affiliated with that body."

ROYAL.

THE Technical Department of the Royal A.C. is being strengthened in view of the Club's new scheme for association and the consequent development of the work.

MOTOR UNION.

THE Highways Protection Committee of the Motor Union are considering private bills to be introduced to Parliament during 1908, so far as they contain any provisions affecting motorists. So far attention has been given to thirteen bills promoted by railway companies, five others which will come before the Light Railway Commissioners, twenty-one brought forward by local authorities and twenty-three relating to tramway undertakings.

AUTO-CYCLE UNION.

THE Sheffield and Hallamshire M.C.C., the Bradford M.C.C. and the Worcester M.C.C. have decided to affiliate to the A.C. Union, and the Newcastle and District M.C.C. have decided to re-affiliate.

THE INCORPORATED INSTITUTION OF
AUTOMOBILE ENGINEERS.

A MEETING of the Council of the Incorporated Institution of Automobile Engineers was held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., on the 22nd ult., when the following were elected members of the Institution:—Messrs. H. G. Burford (London), R. S. Currie (London), B. T. Hamilton (London), N. M. Marshall (Bombay), C. Opperman (London), R. Selz (Luton), W. Truslove (Colchester) and J. A. Wilding (London), and Messrs. W. J. Barker (London), J. W. Haddow (Bedford), W. E. Hicks (Truro), C. A. V. Roper (London), R. R. Seward (Southern Nigeria), E. Stafford (Reading) and F. C. Whitehouse (Birmingham), were elected associate members.

The report of Mr. F. W. Lanchester as to the Conference on Screw Threads of the Engineering Standards Committee was deferred.

KENSINGTON.

THE second annual report of the Kensington Automobile Club refers to the gratifying progress during the past year, the membership having risen from forty-eight to seventy. During the season several pleasant social gatherings were held, that at Chiswick House, by invitation of Mr. C. Molesworth Tuke, being specially successful. On the vexed question as to affiliation with the R.A.C. or the M.U. the committee believe that the time is not yet ripe for making a choice, but recommend that the present affiliation question be postponed until the close of the present year.

CARDIFF.

MR. W. J. HILBORNE (president) took the chair at the fourth annual meeting of the Cardiff Motor Club, which was held at the Queen's Hotel, Cardiff. A large number of members were present. The officers for the year were elected as follows:—President, Lord Ninian Crichton Stuart; vice-presidents, Mr. J. W. Courtis, J.P., Captain D. Hughes Morgan, J.P., Messrs. F. C. Shackel, William Jones (Maindy), G. F. Mason, C. J. Thistle, C. F. Peaty, Herbert Lewis, and W. J. Hilborne, and the Rev. F. W. Hassard-Short; chairman of committee, Mr. Sidney Hill; hon. secretary and treasurer, Mr. H. B. Jotham, Whitechurch. The report and statement of accounts for the year ended December 31st, 1907, showed a balance of £34 17s 9d. in hand.

The question of association with the Royal Automobile Club or affiliation with the Motor Union was fully considered, but it was resolved that the present agreement, which remains in force to December 31st, 1908, be adhered to.

The meeting expressed their appreciation of the services which Mr. H. B. Jotham has rendered to the club as its hon. secretary during the past year, and also to Messrs. H. Haddon and E. Owen, who had undertaken the duties of handicappers at the hill-climbs held during the season. A small sub-committee was appointed to arrange a tangible way of expressing the club's appreciation of these gentlemen. The 1908

programme will include hill-climbs, speed-judging competitions, petrol consumption trials, reliability run, &c. Medals will also be given for the best attendances at the club meets.

LIVERPOOL.

MR. T. CLARK has been appointed captain for 1908, and Mr. R. P. Rutherford sub-captain. The duties of hon. secretary and hon. treasurer have been entrusted to Mr. E. L. Fehr, of 22, Piesons' Row, Liverpool. During the season several interesting competitions will be held.

NORTH WALES.

THE situation arising from the action of the Royal A.C. in terminating its agreement with the M.U. was discussed at a largely-attended meeting of members of the North Wales A.C., held at the Station Hotel, Llandudno Junction. Mr. H. R. Davies (secretary of the club), who, with Mr. E. A. Young, had been appointed to attend the conference of the affiliated clubs held in London to consider the situation, reported upon what occurred. Ultimately, a resolution was passed declaring that the North Wales A.C. should adhere to the M.U., but expressing the hope that the efforts now being made to bring about a reconciliation would be effective.

NOTTINGHAMSHIRE.

THE annual meeting of this club was held on the 24th ult., at the Black Boy Hotel, Nottingham. The president, Mr. Charles Hardy, was in the chair, and the members present included Mr. B. Granger (hon. treasurer and secretary), Dr. R. G. Hogarth, Dr. P. E. Tresidder, Dr. T. D. Pryce, Messrs. A. Barlow, W. D. Wells, H. Bircumshaw, A. N. Lee, H. Belcher, J. Mather, A. E. Dowson, P. L. Huskinson, J. J. Spencer, A. P. Stevens, H. V. Stevens, S. Harvey, C. L. Stevens, R. A. Young, R. Hutchinson, jun., C. E. W. Lucas, A. R. Atkey, F. Mitchell, and M. Ross Browne.

Mr. Granger presented the eighth annual report, which stated that they had maintained their position as one of the most important provincial clubs. The chief factors in keeping the club together were sociability and combination in view of legislation. The number of members on December 31st, 1908, was 205, and on December 31st last 232. The question of the action of the M.U. was thoroughly discussed by the committee. When it was mooted that the R.A.C. intended to terminate their agreement with the M.U., the club welcomed the proposal and decided to stick loyally to the R.A.C., as they were the first provincial club associated with the old A.C.G.B.I.

The Chairman moved the adoption of the report, and, Mr. Atkey, in seconding, remarked that a number of the members of the club knew about the division between the R.A.C. and the M.U. He hoped members would support the committee in their loyalty to the R.A.C. The report was adopted unanimously.

Mr. Charles Hardy was unanimously re-elected president, and Mr. B. Granger hon. treasurer and secretary.

The other officers were appointed as follows:—Vice-presidents, Lieut-Colonel R. L. Birkin, Dr. R. G. Hogarth, Messrs. G. H. Kirk, A. R. Atkey, B. W. Winter, and W. D. Wells; committee, Messrs. A. Barlow, J. J. Spencer, W. D. Foster, A. N. Lee, R. L. Jones, H. D. Snook, H. Bircumshaw, P. Huskinson, H. Rimington, and M. Ross Browne; hon. timekeepers, Messrs. C. Perry, A. Osborne, J. H. Scothern, and G. Butcher; hon. auditors, Messrs. C. L. Stevenson and R. Hutchinson, jun.; hon. solicitor, Mr. C. E. W. Lucas.

SOUTHEND.

THE annual meeting of the Southend and District Motor Club was held on Wednesday at the Hotel Victoria, Southend-on-Sea, when a balance-sheet showing an income of £43 was submitted, and the officers for the year elected.

SUSSEX.

THERE was a large attendance at the annual meeting of the Sussex County A.C., held on Saturday at the Old Ship Hotel, Brighton. Mr. A. Searse Dickins, of Horsham (Chairman of the Committee) presided, and moved the adoption of the third annual report. The committee stated that the club continued in a very satisfactory state. There was only a small decrease in the membership this year, and it was hoped that the members would do their utmost to encourage their friends to join the club and so form a stronger body to protect their interests. The club had again been instrumental in having warning boards erected in dangerous places throughout the county. The most important event of the year affecting the club was the division between the R.A.C. and the Motor Union. The facts had been thoroughly investigated by the committee, and while regretting the precipitate action of the R.A.C., it had been decided that the Sussex County A.C. should tender to the M.U. its loyal and continued support. By taking this step members, it was urged, would be afforded greater privileges than hitherto. The financial statement showed receipts amounting to £454 3s. 7d., including £195 7s. in members' subscriptions, and there was a balance of £142 7s.

The Chairman having briefly commented upon the sound financial position, of which, he said, the members ought to be very proud, the

report was adopted. It was resolved that the annual subscription be £1 1s. instead of £2 2s. as formerly. Earl Russell, Mr. Scrase Dickens, and Mr. Myddelton Gavey were elected to represent the club on the general committee of the Motor Union, and a donation of £2 2s. was voted for the Sussex County Hospital.—Replying to a vote of thanks, the chairman expressed a hope that there would be no diminution in the number of members, especially now the subscription had been reduced. He thought that in such a large county as Sussex more interest should be displayed in the work of the club. There was no doubt that it had done and was still doing a large amount of good in the county. The club's funds and influence were at all times available for members when they had any grievances or legal difficulties or when they required any information.

YORKSHIRE.

THE officers of this club for 1908 have been elected as follows:—President, Earl Fitzwilliam; vice-presidents, Messrs. A. W. M. Bosville, W. Penrose Green, H. R. Kirk, A. H. Briggs, D. H. Thornton; committee, Messrs. A. Exley, A. Farnell, E. H. Hepper, L. Hey, H. A. Jones, J. L. Kirk, S. Rumbold, P. D. Thomas, A. Towler, R. Winn, Guy Barrett, and J. Mortimer; hon. secretary and treasurer, Mr. Charles P. Wilson; hon. solicitor, Mr. Alf Masser.

In the annual report mention was made of the fact that the membership had risen from 260 to 295, and in addition the clubs affiliated, viz., Huddersfield, Cleveland, Harrogate, Bradford, Barnsley, and Halifax, had continued to prosper. The numerical strength of the Yorkshire Automobile Club with its affiliated branches is nearly 800, making it the largest provincial automobile organisation. There was a surplus on the year's working of £188 1s. 2d. after writing off depreciation and carrying £50 17s. to the reserve account. The capital account of the club now stands at £346 11s. 2½d. as against £178 10s. 0½d. on January 1st, 1907, a satisfactory position, which it is hoped will be maintained. Reference was also made to the Saltburn speed trials, which are to be repeated during the present year. At Greenhow Hill, Pateley Bridge, a successful hill climb was carried out with the assistance of the local authorities.

The committee has carefully considered the split between the R.A.C. and the M.U. and its bearing upon the Yorkshire A.C., and came to the unanimous conclusion that the best interests of the club and the members would be served by taking neither one side nor the other, but continue the present affiliation agreement, which neither the M.U. nor the R.A.C. can terminate until December 31st, 1908, and look to both bodies to carry out their duties and obligations to the Y.A.C. under the agreement at present in force.

SCOTTISH.

THE annual dinner of the Scottish Automobile Club was held on Friday, the 24th ult., in the North British Station Hotel, Edinburgh. There was a company of about 250 gentlemen. Sir J. H. A. Macdonald, K.C.B., Lord Justice-Clerk of Scotland, president of the club, occupied the chair, while Mr. John Wilson, of Liberton, vice-president of the general committee, acted as croupier. There were also present:—Lord Provost Gibson, Edinburgh; Lord Salvesen, Rev. Dr. Mitford Mitchell, Moderator of the Church of Scotland; Mr. Alexander Ure, K.C., M.P., Solicitor-General for Scotland; Lord Ardwall, Mr. J. A. Clyde, K.C., Lieutenant-General Sir E. P. Leach, Very Rev. James Cameron Lees, C.V.O., V.D., Lord Provost Longair, Dundee; Mr. James M. Ewing, the Master of the Merchant Company of Edinburgh; and Mr. R. J. Smith.

The loyal toasts having been pledged, Sheriff MacLennan gave "The Imperial Forces," and Lieutenant-General Sir E. P. Leach replied.

Lord Salvesen proposed, "The Houses of Parliament." To the question whether the House of Commons was going to harass what had become a great industry, and what was certainly a most legitimate and delightful sport, he said he did not have very great fear of the present House of Commons, because if one was to judge from the use the members of the House made of the automobile as to their attitude towards it, he would say the vast majority of the members of the House of Commons must be in sympathy.

The Solicitor-General for Scotland responded.

Mr. J. Avon Clyde, K.C., proposed the toast of the evening, "Automobilism." There was no doubt about it that automobilism had been subject from its birth to something which could only be described as repressive legislation. One of the most melancholy results of this legislation was that automobilists had had the misfortune to find themselves unexpectedly in the position of, should he say, potential law-breakers. The automobile had another aspect for them, and for him it had become a practical necessity. Neither they nor he, when they looked back, could realise how they got on when there was no automobile on the road, and if they looked to the future neither they nor he could foretell the uses which the automobile might yet serve, and social problems even which the automobile might not help to solve. He did not pretend that at the present moment the automobile was entirely capable of filling the breach, but the marvellous results which could be attained by the petrol engine, the wonderful practical efficiency which these results had achieved with the assistance of that doubtful element the pneumatic tyre, were, after all, only stepping-stones to greater things, and it seemed to him that in doing what they could to help the cause of automobilism they were doing something to help forward an instrument

which might well have predicted for it the fate of playing no small part in the development of the country and its society.

The President, in replying, said he thought they must all remember that they still had a great many enemies, and a good many people who had not sense enough to see what automobilism meant, and what it must become in the future. Speaking of the difficulties that had to be faced on the road he said there was a good deal to be said against some of them. He heartily rejoiced to see in the papers lately that there had been sentences passed. The only thing he congratulated himself about was that there was no doubt it would do a great deal of good where it was needed. He was glad to see none of these cases happened within the circle made by the Automobile Club of Scotland. Let them consider how the thing was spreading. Who would not have been considered a madman if he had told anybody seven or eight years ago that people would have been collecting money to make a gift to a Bishop of a motor-car? It was spreading in other directions. The motor-car had always been looked on hitherto as a source of sport and enjoyment. The automobile was becoming the ordinary carriage for use in town.

At a meeting of the committee of the Scottish A.C., held in Edinburgh on Friday of last week, the unanimous recommendation of the executive, that the club should cancel the present agreement with the R.A.C. and the Motor Union, and should enter into a new agreement of association with the Royal Club, was unanimously adopted. The draft of the new agreement repeated the terms of the former treaty acknowledging the supremacy of the Scottish A.C. in Scotland in all

The Duke of Oporto on his Fiat Car.

[L'Automobile, Milan.]

matters relating to the movement, while among the advantages conferred upon the members of the Scottish A.C. for the first time are the benefits of the foreign customs arrangements made by the R.A.C., known as the "Tryptique System," and the use of club rooms in London specially set apart for associates of the Royal Club.

The committee in arriving at this resolution had in mind the fact that the Royal A.C. is acknowledged as the supreme governing body, and that it is only proper, having regard to the fact that the Scottish Club is the National Club of Scotland, and controls the movement therein, and having regard also to the many matters which call for united action with the Royal Club, and to the necessity for alliance and co-operation with it in respect of competitive and sporting events and disciplinary matters, that the S.A.C. should be in closest alliance therewith. The committee in thus terminating their present agreement with the Motor Union had before them the consideration that in special matters of legal defence, the attendance at public inquiries under the Motor Car Act, negotiation with road and public authorities, and other kindred matters, they have all along undertaken for Scotland all the matters arising under them as well as under other heads of the Motor Union's work. At the same time the committee agreed to record and convey to the Motor Union their view that, notwithstanding this change in relationship between the Scottish Club and them, they saw no reason why the cordiality and co-operation existing between them in the past should not continue, or why the work which has been done by the Scottish Club for the members of the M.U. in the past should not be made available to them, in so far as in their power, in the future.

THE EDINBURGH MOTOR SHOW.

THE eleventh annual Scottish Motor-car Exhibition, held in the Waverley Market, Edinburgh, was opened on Friday, the 24th ult. The show has been very well supported by the trade, examples of all the leading makes being on view. As practically the whole of them have already been fully dealt with in these pages it is hardly necessary for us to go over the ground again. A brief summary of the exhibits is, however, appended.

Considerable interest is being taken in the chassis of the Sheffield-Simplex 45-h.p. six-cylinder cars shown by Messrs. Middleton and Townsend, Edinburgh. A description of the vehicle has already appeared in the *M.C.J.*, while the other day we had an opportunity of taking a run on it, when we were much impressed with its sweet running. At this stand is also to be seen the magnetic clutch made under the Ravenshaw, Middleton and Townsend patents. One of the largest stands is that of Messrs. Thos. Shaw, Ltd., Dundee, the exhibit comprising Napier, Siddeley, Humber, Ariel and De Dion cars. A range of Siddeleys and Napiers is also shown by Messrs. Rossleigh, Ltd., Edinburgh. The Caledonian Motor Car Company, Ltd., Aberdeen, exhibit both Standard six-cylinder and Peugeot four-cylinder cars. Fiat Motors, Ltd., are present with examples of the 15-20-h.p., 28-35-h.p., and 35-40-h.p. Fiat vehicles, the latter being fitted with a double-phaeton body, front glass screen, and Cape cart hood by Maythorn. The Maja Concession Company, of London, exhibit for the first time several of the 28-35-h.p. Maja cars with both chain drive and cardan shaft transmission. Messrs. John Croal and Sons, Ltd., Edinburgh, have a large stand, on which is shown an array of the latest types of De Dietrich, De Dion, and Rolls Royce vehicles. The exhibit of St. Vincent Motor and Cycle Company, Ltd., Glasgow, comprises a 24-30-h.p. St. Vincent side-entrance car, a 14-16-h.p. landaulet, a 10-12-h.p. touring vehicle and a 14-16-h.p. twelve-seated char-a-banc for public service work. The Sinclair Rubber Company, Edinburgh, display the Motobloc cars, for which they are agents in Scotland and the North of England. The Ariel Motors, Ltd., are showing one of the new 20-h.p. broughams, of which we gave an illustration a fortnight or so ago, as well as a 30-40-h.p. car and a 40-50-h.p. limousine landaulet. The Humber Company's exhibits range from a 10-12-h.p. car to one of the latest 30-h.p. six-cylinder vehicles. The Daimler cars on view at the stand of the Scottish Automobile Company, Ltd., Edinburgh, include examples of the 30-h.p. and 42-h.p. types with different bodies; the Siddeley and Panhard cars are displayed by Messrs. Rennie and Prosser, Ltd., Glasgow; two sizes of the Itala cars, 35-45-h.p. and 20-30-h.p., are shown by the Itala Automobiles, Ltd., the former being in chassis form and the latter fitted with a handsome limousine body by Messrs. Morgan and Co.; the Kennedy Motor Company, Ltd., Glasgow, show Austin, Minerva, Thornycroft and Darracq vehicles. A large display of both the 20-h.p. and 30-h.p. White steam cars is made by the White Steam Car Company, including one with a double phaeton body and Victoria hood and another finished as a limousine. Messrs. Croal and Croal, Edinburgh, show examples of four sizes of Porthos cars and one of the Passe-Partout light vehicles, of which a description was given in a recent issue of the *M.C.J.* Two well-finished specimens of the Vulcan and Hotchkiss cars are on view at the stand of the London and Parisian Motor Company, Ltd.; while the 16-24-h.p. Vinot cars are shown by Mr. D. Drover, Leith. Other cars on view include the Alldays, Martini, Riley, Lanchester, Renault, Albion, Arrol-Johnston, Sunbeam, Calhorne, Argyll, Iris, Cottereau, Clement, Gladiator, Deasy, North British (Druumond), Dennis, Adams, Belhaven, Mass, Gregoire, Nordenfelt, Ford, Rover, Clement-Talbot, Westinghouse, Decauville, and S.C.A.T. Among the industrial vehicles on view are a 20-h.p. two-ton lorry by Messrs. Durham, Churchill and Co., a five-ton steam wagon by Messrs. D. Stewart and Company, Ltd., Glasgow, and one, two and three-ton lorries by the new Arrol-Johnston Car Company, Ltd.

In the accessory section notable displays are made by Messrs. Alfred Dunhill, Ltd., the Scottish Motor Supply Company, Glasgow (Vandervell accumulators, Samson non-skids, F. and S. ball bearings, O.S. speedometers, &c.), the Union Rubber and Chemical Company, Ltd., the County Chemical Company, Ltd., Messrs. W. Barton and Sons, Edinburgh, Messrs. F. S. Nickells and Co., Blackheath (Universal valve connectors, tyre gauges, &c.), and Messrs. J. Thomson and Son, Edinburgh (Bleriot headlights, H.F. vulcanisers, Smith's speedometers, Stepney spare wheels, &c.). The exhibitors of tyres include the Palmer, Continental, Dunlop, Moseley, Goodrich, Elastes, Clincher, Gaulois, Michelin, and Shrewsbury and Challiner companies. Price's Patent Candle Company, Ltd., and Messrs. Moebius and Son, Stoke Newington, N., display their usual wide selection of motor lubricants, while among the petroleum spirit firms represented are the Anglo-American Oil Company, Ltd. (Pratts), the British Petroleum Company, Ltd. (Shell), and the Gas Lighting Improvement Company, Ltd. (Carburine). The Show closes to-day (Saturday).

THE NATIONAL MOTOR ACADEMY, LTD., of Boundary Road, Holland Park, W., have acquired a number of the more important components of the six-cylindered Napier car which may now be added to the list of those in which complete technical instruction can now be given at the academy. Special arrangements have been made for equally thorough technical teaching on the F.I.A.T. cars, with driving lessons around the private track.

CHAUFFEUR-VALET'S CLAIM.

WALTER H. DARK, who described himself as a chauffeur-valet, of Lavender Sweep, S.W., brought an action at Brompton, before Sir William Selve, on Monday, in which he sought to recover a month's wages and a month's wages in lieu of notice from Lord Rossmore. A certain sum had been paid into court with denial of liability. Plaintiff's counsel stated that his client was claiming for two months' wages, for railway fares, &c. Plaintiff said he was in Ireland when he received a telegram from his employer summarily dismissing him. He journeyed to London and endeavoured to see his lordship, but Lord Rossmore would not see him. He understood from a gentleman who did see his employer that the latter had said if he could clear his character he would be taken back. The accusation was that he had hired his master's motor-car out in Armagh. He had taken a gentleman for rides and received tips from him, but he had been told that he could take the car out whenever he liked. The defence was that on several occasions plaintiff had been unable to attend to the smallest defect on the car, and as a result had had on many trips to have it fetched back from miles out in the country. He had had to be taught how to drive and attend to the car by a motor-car engineer in Armagh. Mr. McBride, a civil engineer, said he had on five occasions ridden in Lord Rossmore's car, but each time he had given plaintiff 10s. 6d. for the trip. His Honour said he did not think plaintiff's incompetence had been proved, or that he had been guilty of anything which would warrant his summary dismissal. He found for plaintiff for £11 10s., less the £2 10s. received from Mr. McBride.

THE CROYDON MOTOR FATALITY.

DUNCAN BROWN, chauffeur, of Hayes Court, Kenley, was remanded at Croydon on Wednesday week in connection with the death of Arthur Borer, Kenley, who was knocked down by a motor-car on the night of Saturday, the 11th ult. The circumstances of the affair have been previously reported. Brown was remanded for a week and allowed the same bail as previously, himself in £200, and two sureties of £100 each.

Dr. Jackson resumed the inquest at Croydon, on Tuesday, into the death of Arthur Borer. Two witnesses gave evidence as to seeing a motor-car on the Godstone road just before the accident occurred. Arthur Butler, a night watchman, stated that on January 11th he was on duty at some sewer works that were being carried out in the Whyteleaf road, leading to Caterham. A chain was drawn across, with a red light as a signal, and a notice board, bearing the words "This road is closed." Lights were shown for some distance as an indication to pedestrians. When sitting in the watchman's box he heard a crashing of glass, and saw a motor, L.N. 2,011, backing to get out of the way. The driver was Brown, who gave his name and number very readily. The witness Ford, who was with the deceased man, was cross-examined by Mr. Lunge, and he admitted that if he and the deceased had been walking on the proper side of the road the accident would not have taken place. The Coroner: There is no proper side of the road legally. Pedestrians are entitled to walk on either side, but they ought to exercise common sense in the use of the road.

The coroner, summing-up to the jury, observed that no doubt they had made up their minds that the car which travelled down the Godstone road and killed Borer was going at a dangerous rate. The case seemed to be one of manslaughter. The jury would say whether Brown should take his trial on that charge, on their commitment, or should the matter be left in the hands of the police to make further inquiries. This was the second motor-car fatality that he had investigated this year, and last year he held five inquests on victims in motor accidents. In this case there were some aggravating circumstances, especially in regard to the manner in which the driver of the car left the man he had knocked down to shift for himself, when he must have known that he was badly injured. The jury, after a brief deliberation in private, returned a verdict of "Manslaughter against some person or persons unknown." The coroner said he agreed with the verdict, as he did not consider the evidence which had been given against Brown was sufficient.

THE STORAGE OF PETROL.

RECENTLY the British Petroleum Company were prosecuted by the Gainsborough Council for storing a quantity of motor spirit, being petroleum within the meaning of the Acts 1871 and 1879, without having the necessary licence, and which resulted in the seizure of 250 gallons of spirit by the Council's Inspector, Superintendent Wilkinso. For the defence it was urged that the licence held by Mr. Edwin Baines, upon whose premises the seizure was made, covered the storage, also that 200 of the gallons were only placed in a yard prior to immediate removal to customers. The remaining 50 gallons were in a building for which Mr. Baines held a licence.

In view of the importance of the case, the Bench reserved decision, and this has now been delivered by the chairman (Mr. Embleton-Fox).

After reviewing the evidence, Mr. Fox said they felt compelled to inflict the full penalty of £20, together with £5 as costs, and the 50 gallons of spirit in the possession of the inspector became forfeited.

At the request of Mr. Tweed, for the defendant company, the Bench agreed to state a case.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

At Kingston on Thursday last week twenty-one motorists were each fined £5 and costs for exceeding the speed limit on the Portsmouth road. During January considerably more than £300 was received from motorists in fines at that court.

Several motorists have been fined at the Newmarket Petty Sessions for exceeding the legal limit.

A TRIO OF SUMMONSES DISMISSED.

Mr. Oscar Cupper was summoned at the Marylebone Police Court, on the 20th ult., for the following offences:—1, Exceeding a speed of twenty miles an hour; 2, Failing to stop when requested; and 3, Failing to produce his licence. After a lengthy hearing the matter was in the first instance adjourned until Monday.

At the resumed hearing, after hearing Mr. Woner for the prosecution and Mr. J. S. Blankensee for the defendant, the magistrate (Mr. Paul Taylor) decided to dismiss all the summonses.

COMPANY NEWS.

NEWCASTLE BENZOL COMPANY.—£10,000. Agreement with Priestman Collieries, Ltd.

COVENTRY CHAIN CO., (1907) LTD.—The annual meeting of the Coventry Chain Co. (1907), Ltd., was held in the offices of the new works at Spon End last week. Councillor A. S. Hill (managing director) presided. The first annual report showed that the profit for the year, after providing for depreciations, bad and doubtful debts, and all charges, amounted to £8,545 3s. 3d.; deducting bonuses due to employees of £1,057 2s. 6d., left a net balance of £7,488 0s. 9d. Of this amount £4,094 5s. 6d. represented the profit made from August 31st, 1906, to the date of the incorporation of the company, viz., March 26th, 1907. The Chairman, in moving the adoption of the report, said the increase of turnover in the past year as compared with the previous, when the business was in the hands of the private company, was approximately 80 per cent. The foreign business had more than doubled. The present popularity of the live axle drive amongst automobile manufacturers had affected the business, but he thought a new patent which they were getting out would considerably help. The cycle department was doing well. Mr. Percy Martin seconded the adoption of the report. He said the stock items were large, but season fashion did not apply to this business. The report was adopted. The retiring director, Mr. N. Hill, was re-elected.

PRODUCERS' PETROLEUM COMPANY.—£200,000 (£10). To carry on business of producers, refiners, storers, and suppliers of petroleum and its products, &c. Sir W. D. Pearson, Bart., M.P., is one of the directors.

SOCIÉTÉ FRANÇAISE DES PNEUMATIQUES DUNLOP.—The directors of the Société Française des Pneumatiques Dunlop, Ltd., report that the net profits upon the trading of the company for the year ended July 31st last, including dividends on investments and transfer fees, amounted to £16,087, which, with the balance from last account of £26,721, is increased to £42,808. From this sum deductions have been made leaving a balance of £37,767. Out of this sum the directors recommend dividends at the rate of 6 per cent. per annum on the preference shares, amounting to £2,994, and 6 per cent. per annum on the ordinary shares, amounting to £6,183, leaving a balance of £28,590 to be carried to next account. The motor tyre trade has not developed with sufficient rapidity in France to make up for the loss in volume in the cycle tyre department. The directors are adopting every means which, in their judgment, are best calculated to improve conditions and make developments more in accordance with the anticipations of the company.

SPANISH MOTOR TRANSPORT COMPANY.—£12,000. To establish services of motor-cars and wagons between Almeria and Huerca Overa and between Almeria and Berja, Spain. Agreement with Francisco de Lazaro y Ruiz y Castellon. Crown Buildings, 2, Watling Street, E.C.

THE NORTHERN AUTOMOBILE COMPANY, LTD.—At a board meeting held on Friday, the 24th ult., the accounts and report of the auditor (Mr. Albert E. Stringer) for the half-year ended December 31st last were considered. The accounts showed satisfactory progress had been made during the period under review, and that the sales and garage receipts were steadily increasing. The profit earned, after providing for all charges, and depreciating plant, &c., was equal to 16 per cent. per annum on the share capital.

MR. W. S. JAMIESON, of Stowlangtoft Hall, Bury St. Edmunds, has just acquired a 60-h p. Spa car.

THE FOREGROVE MACHINERY COMPANY, LTD., of Admiral Street, Dewsbury Road, Leeds, have lately put on the market a new tyre vulcaniser in which the necessary heat is obtained by means of hot air, obtained by either a charcoal or gas burner.

A **FOUNDRY** has recently been added to the already complete repair works of Messrs. Panhard-Levassor, Acton Vale, W. The new addition will enable the firm to cast a facsimile of any part of a motor-car with a minimum of delay.

Messrs. D'YNE AND WILLANS, LTD., of Gillingham Street, Belgrave, S.W., have just received the first Piccard-Pictet 28-40-h.p. six-cylinder car. This Swiss-built vehicle comprises a number of interesting features and will well repay close inspection.

SPEED LIMIT INQUIRY AT BELFAST.

ON the morning of the 22nd ult., in the City Hall, Belfast, Mr. E. A. Sanderson, one of the Inspectors of the Local Government Board, opened an inquiry regarding the proposal of the Corporation to obtain sanction for an order restricting the speed of motor vehicles within the whole borough boundary to a maximum speed of ten miles per hour. To this bye-law strong objection had been entered by the Irish Automobile Club, the Motor Cycle Union of Ireland, and a mass meeting of Belfast motorists. Hence the inquiry. Mr. Overend, B.L. (instructed by Sir Samuel Black, Town Clerk), appeared for the Corporation; Mr. Wm. Moore, K.C., M.P., and Mr. H. Hanna, B.L. (instructed by Mr. McMillan, J. C. White and Co.), appeared for the Automobile Club, other bodies, and several ratepayers; and Mr. James Moles, B.L. (instructed by Mr. P. T. Brady), represented the Motor Cycle Union of Ireland and several ratepayers.

Mr. Overend, for the Corporation, said representations had been made to various members of the Corporation in November last, and a letter was written by the Lord Mayor to the Police Committee suggesting an application to the Local Government Board under Section 9 of the Act for a special reduced speed limit. The Police Committee looked into the matter, and made the present application with the approval of the Council. Lord Shaftesbury, Dr. J. D. Williamson, chairman of the Police Committee, Mr. Cutler, the city surveyor, and Mr. Hill, the city Commissioner of Police, were examined in support of the application. The latter said he had caused a record of the reported cases of accident to be prepared, and a record of the prosecutions. The total prosecutions since 1902 were thirty-three. There were eleven convictions; and one case was dismissed. In 1904 the number reported was three; 1905,

The 30-cwt. Motor-Van recently supplied by the Industrial Motor Company, Windsor, to Mr. Harry D. Sillito, Baker, of Golden Hill, Staffordshire.

three; 1906, eight; and 1907, eighteen. The police so far proceeded under Section 1 of the Act. If proceeding under a speed limit, it would require special constables stationed at given measured distances with stop watches to prove excess of the speed limit, in order to secure a conviction. He thought the powers under the Act were most ample, because all that was necessary was to prove driving to common danger, even if this was only one mile an hour, so that in this respect the new bye-law was weaker.

For the opposition, Mr. Moore pointed out that the proposed restriction was over an area of twenty-three miles. Dr. McKisack said he had been using motor-cars in his practice for nearly five years and had covered about 45,000 miles, mainly in Belfast. He could give instances of life being saved by the doctor being at liberty to travel at a greater speed than ten miles, and he had been informed of numerous other cases where life had been saved similarly. The Very Rev. the Dean of Belfast could see no reason for the restriction, nor could Dr. J. J. Austin and Dr. Dempsey, both of whom regard the motor-car as indispensable to the medical man. Their evidence close the inquiry.

THE South Wales agents for the Star and Starling cars are Messrs. C. J. Richards and Co., of Pontypridd.

MOTOR-CARS were requisitioned for the delivery of newspapers in Manchester last week on the occasion of a strike among the carters employed by the wholesale newsagents.

For some time past Messrs. Panhard and Levassor, at their Acton Vale works, have been devoting special attention to the packing and shipping of automobiles, and their equipment for this work is now at the disposal of purchasers and manufacturers of any make of car. On the occasion of a recent visit to the works we noted cars crated for dispatch to Italy, the United States, Brazil, Russia, Ceylon, and Denmark.

FORTHCOMING EVENTS.

FEBRUARY.

- 1st (Sat.).—Annual meeting of the Lincolnshire A.C.
 2nd (Sun.).—Reliability Trial of the Motor Union of Western India.
 4th (Tu.).—I.I.A.E., Dr. Hele-Shaw's address to graduates' section.
 5th (W.).—Annual dinner of the Bradford A.C.
 6th (Th.).—R.A.C., Mr. Philip Dawson on the Electrification of Railways.
 7th (F.).—N.W. London M.C.C. annual general meeting.
 7th-15th.—Motor Show, Manchester.
 12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 13th (Th.).—R.A.C., Mr. Wyatt on Magnetos.
 15th (Sat.).—Auto-Cycle Union annual dinner at the Hotel Cecil, London.
 19th (W.).—Annual dinner of the Cardiff M.C.
 20th (Th.).—Meeting of the Essex M.C.
 21st (F.)-29th (Sat.).—Manchester Motor-Car Show at Belle Vue.
 24th (M.).—Motor Show opens at Bcmby.
 27th (Th.).—Mr. Mervyn O'Gorman at the R.A.C. on "Gear Transmission."

MARCH.

- 5th (Th.).—Paper by Dr. W. Watson at the R.A.C.
 11th (W.).—Annual meeting of the Incorporated Institution of Automobile Engineers.
 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 21st (S.)-28th (S.).—Cordingley's Thirtieth International Motor-Car Exhibition at the Royal Agricultural Hall, London.

APRIL.

- 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.

MAY.

- 10th (Sun.).—Targa Florio Race.
 11 (M.)-16 (S.).—Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

- 11th (Th.).—Probable start of the International Touring Car Trial of the R.A.C.
 15th-19th.—Scottish Reliability Trial.

LIGHTING-UP TIMES—LONDON.

POLICE TRAPS.

LOAMPIT VALE, Lewisham, is again the scene of police activity against motorists.

RETFORD and Bawtry, on the Great North Road, are danger zones at the week end.

AUTOMOBILE ACCIDENT.

A SERIOUS motor-car accident has occurred in Coventry. A car which had been driven from London was proceeding to the Daimler Company's works for repair, and when turning the corner of Much Park Street into Earl Street headed for a shop, but was checked by the kerbing. Then the car twisted and crashed into the wall at the side of the Old Star Inn, doing much damage to the front of the vehicle, besides smashing the lamp on the car.

THE MOTOR UNION.

A STATEMENT has been issued by order of the committee of the Motor Union showing a comparison of the advantages it offers as against those of the R.A.C. It declares that the financial backbone of the Union has been the subscriptions of individual members, who last year contributed over £4,000.

AUTO-CYCLE UNION.

THE Auto-Cycle Union has decided to sever its connection with the M.U. and affiliate itself directly with the Royal A.C. The chief point involved in the change now made is that the Auto-Cycle Union will in future have complete autonomy and the absolute control of its own finances.

ARIEL MOTORS, LTD., have appointed Mr. J. Fryer, Progress Motor Works, Kingston, agent for Ariel cars in the county of Herefordshire.

THE Albany Automobile Company, Ltd., of 106, Albany Street, N.W., have opened fine new show rooms at 110, Albany Street, N.W. They have also started a new department for instruction and driving of cars, and have made great headway in the second-hand car trade.

As an instance of how the motor trade is growing in Portugal, it may be mentioned that one morning last week the Stepney Wheel Company received orders for twenty Stepney spare wheels to be despatched to that country. Altogether during the past six weeks sixty Stepney wheels have been despatched to Portugal, while during the past two months over 100 have been despatched to New Zealand.

RACING AND TOURING CARS.

ON Friday of last week Mr. S. F. Edge read a paper before the Coventry Engineering Society on "Experience in the design of motor cars gained from racing." It was illustrated with lantern slides which recalled many interesting incidents in the progress of the automobile. Enquiring as to what constitutes the modern touring car so far as the chassis is concerned, the lecturer gave a list of a dozen points which he regarded as important, as follows:—1. The engine to be non-existent so far as the occupants of the car are concerned. 2. The functions of the engine to be performed automatically with as little assistance from the driver as possible. 3. That the engine shall be kept cool without the necessity for stopping or adding cooling material. 4. That either going up or down hill neither the accelerating nor the retarding forces shall be noticeable by the occupant, and whichever is required to be capable of application by the driver without strain or effort. 5. If the road conditions or lack of adaptability of our motive power require change of gear, that the change of gear or deceleration shall be unnoted by the occupants. 6. That the method of conveying the power to the driving wheels shall be done without noise and without appreciable wear. 7. That the method of conveying the power to the road wheels shall be independent of weather conditions. 8. That a minimum loss of power shall occur between the engine and the road wheels. 9. That the suspension of the vehicle shall be such that the minimum of vibration from road surfaces shall be conveyed to the occupants. 10. That every point previously mentioned shall be obtained with the minimum of weight. 11. Wheels strongest possible for a given weight. Rapidly detachable for tyre attention. 12. Lightness to touch and strength of parts of steering.

In summing up, Mr. Edge traced many of the improvements he had enumerated to experiences with racing cars, particularising in almost every instance. He ascribed the large success of the touring car of to-day to the contests on tracks and in hill climbing competitions, and concluded with a plea for British cars.

BUSINESS NEWS.

THE COVENTRY CHAIN COMPANY (1907), LTD., have issued a series of motto cards, the obverse side of which will serve to draw attention to their well-known specialities.

IN the recent Reliability Test held under the auspices of the Automobile Club of Victoria, and extending over a period of three days, the 40-h.p. six-cylinder Napier was awarded the maximum number of marks, viz., 300, and also a gold medal.

WE learn that Messrs. Colin Defries, Ltd., 2, Denman Street, W., have acquired the British agency for the Passe Partout cars, of which a description was given in the M.C.J. of the 4th ult.

THE Council of the Borough of Lambeth has altered the numbers of the premises of the Automobile Carriage Builders, Ltd., to 66 and 68, Wandsworth Road, Vauxhall, S.W.

MESSRS. J. E. HUTTON, LTD., have secured an order from Mr. John C. Connell, of the Scotstoun Shipbuilding Yard, Scotstoun, Glasgow, for a Berliet 40-h.p. six-cylinder car, with special phaeton body.

WE learn that Messrs. Monnet Plasse and Co., of 20, Store Street, London, W.C., are the sole agents for the United Kingdom for the Nieuport magnetos described in our last issue.

THE important question of "under-tying" a car is one that has received but little attention. It is unfortunately a common failing to see cars which should unquestionably be fitted with 5 in. or 5½ in. covers shod with 3½ in. tyres. The initial cost is, of course, with some a very important and deciding factor, but when increased mileage, durability, comfort and economy, both as regards petrol consumption and the wear and tear of machinery, are taken into consideration, the larger tyres amply compensate for any additional expense. The theory, moreover, that large tyres are unsuitable for high speed is disproved by Mr. Clifford-Earp's recent successes at Brooklands on a 60-h.p. Thames car, fitted with 6 in. Palmer cord tyres. Not once during his record breaking runs was Mr. Clifford-Earp worried by the tyres, the covers used showing little or no sign of the hard work accomplished. Further, the Palmer Tyre Company claim that increased speed is obtainable by the use of large covers, and, so far from being difficult, the steering with the larger tread is as easy, if not easier, than with smaller tyres. In connection with the latter the question of inflation must be considered; the pressure required in 6 in. Palmers fitted to the front wheels of a car weighing, say, 26 cwt. should not exceed 60 lbs. We need hardly say that on the question of durability large tyres give by far the greater mileage; on a car of 18-h.p. or 24-h.p., for example, quite 14,000 miles should be obtained, after which they can be re-treaded.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, FEBRUARY 8, 1908.

[No. 466.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE fine weather of this week has led to a feeling of optimism in many trade circles, and the gloom which has hung about the motor-car showrooms for some weeks has a prospect of dissipation. Last season the full and early rains did much to harass the industry at a time when it should have promised well. Now we are hopeful that the climatic conditions will not run counter to the interests of the industry, and that an early buying will be the current note.

That agents for touring and pleasure cars have a more buoyant feeling is seen from the growing interest that is being shown in the Spring Show at the Agricultural Hall, London, which takes place next month. This always opens the selling period of the year so far as automobiles are concerned, and is not likely to be an exception in 1908. Manufacturers freely recognise the value of the display in disposing of stocks, and the quickened concern with regard to the spaces now available at that Exhibition indicates their appreciation of its importance to the industry. On the other hand, many prospective motorists will not make up their minds as to their ultimate possessions until they have visited the Show. This year it occurs from March 21st to the 28th—coming sufficiently long before Easter to give them an opportunity of becoming acquainted with their cars before enjoying a holiday motor tour.

Proposed Speed Limit in Lincolnshire.

A LOCAL Government Board enquiry was held on the 28th ult. at Spittlegate, Grantham, as to the application of the Kesteven County Council for the restriction of the speed of motor-cars passing through the village of Colsterworth, on the Great North Road, to ten miles an hour. The length of highway to which the limit was proposed to apply is 770 yards. For the R.A.C., the M.U., and the Lincolnshire Automobile Club Mr. Rees Jeffreys appeared, and, having expressed his recognition of the sympathetic manner in which the County Council had administered the Act, withdrew opposition on behalf of the bodies he represented. Dr. Godfrey Lowe mentioned the fact that complaints of furious driving through the village generally arose in connection with vehicles driven at night by hired drivers. It was the paid driver and not the owner who was responsible for such dangerous practices in rural districts.

Views of Estate Agents.

ESTATE agents are naturally interested in the development of locomotion, having regard to the important part it plays in the appreciation of property; hence the interest aroused among those dealing with land and house property in the paper read by Mr. S. J. Chesterton before the members of their Institute a few evenings ago. Electric tramways, he pointed out, have opened up many outlying suburbs, and have considerably increased the value of large areas of land. With regard to motor-buses he was less optimistic, although recognising that the disadvantages associated with them in the early days were now not nearly so marked, and that during the last few months steady improvement in the running of this type of vehicle had

been observed. That being so, the depreciation which had followed their introduction in some districts would in time disappear to a considerable extent. There is little doubt that an enormous number of people will come to town in such vehicles when experience has given something approaching finality to the design. Speaking generally, the estate agents present who took part in the discussion seemed to agree that, however inconvenient and irritating some of the effects of the new locomotion may have been in the first flush, the ultimate result will be to enhance the value of property and generally benefit the whole country.

Road Reports.

ONE of the new activities of the Royal Automobile Club has been to circularise the county and borough surveyors with regard to the condition of the roads under their control. This seems a modified form of the special feature that we have made during the last two or three years of publishing regular reports showing where roads are under repair, and where motorists are likely to be inconvenienced from such a cause. Our efforts in this direction have been uniformly successful and of general value to motorists, and now that they are being supplemented by the official organisation of the movement, those who drive cars will have no lack of information during the coming season.

In the Balance.

THE question of affiliation to the R.A.C. or the M.U. still disturbs the settled order of many of the provincial clubs, and it will be some time before the decision of all the organisations is arrived at. One curiosity of the position has occurred in the Midlands, where the General Committee of the Midland Automobile Club were so evenly divided on the subject that it was decided to obtain a postal vote of the members. This has now taken place, and the result shows that out of 272 members 214 voted, of whom 107 were for the R.A.C. and the same number for the M.U. Under such circumstances the most obvious conclusion seems to be that the club should continue its association with both bodies until the end of the present year—a decision which, we learn at the moment of going to press, has been adopted.

Trials at Bombay.

ON Sunday the Reliability Trials of the Motor Union of Western India commenced with the run from Bombay to Kolhapore and back, via Mahabaleshwar, which was to continue until Wednesday. This is to be followed with a motor gymkhana and show on the 24th inst. As we have already announced, the entries numbered twenty-five when last advised. Among the competitors was the Maharaja of Tikari, who entered two cars, and was to compete personally in the Trials. He also presented a valuable cup. On the last occasion on which he took part in these trials he lost, by only two points, the chance of being the joint winner in his class with the 50-h.p. De Dietrich. The Rana of Porbunder has also given the Championship Trophy, and H.H. the Maharaja of Cooh Behar has presented a valuable

Championship Cup, so that there will be fifty valuable trophies for competition. It has been decided on this occasion that small cups, to be kept, will be presented with the Championship trophy, and that both the owner of the car and the driver will receive diplomas and gold medals, so that there will be some lasting satisfaction in taking part in the Trials.

The Fiat Company's Extensions.

WHEN proceeding North the other week, *via* the L. & N.W. R., we noticed that at the side of the Aster Company's works at Wembley, between Willesden and Harrow, had sprung up a large new building bearing in big letters the word "Fiat." Strangely enough, a few days later came an invitation from Fiat Motors, Ltd., to inspect the new works on Tuesday last, an invitation which we promptly accepted. The new departure of this enterprising concern is an outcome of the popularity of Fiat cars in this country, the fact that, although the first vehicles were only introduced about the beginning of 1903, there are now upwards of 700 in use in Great Britain rendering it necessary that some special provision should be made for the efficient carrying out of any necessary

Touring in France.—The Belfry at Dunkirk.

repairs and for the prompt supply of spare parts and replacements. For a time the work was carried on at Willesden, but more convenient premises being found desirable, about five acres of land were acquired at Wembley, and in March last the erection of the necessary buildings was put in hand. So far only about 1½ acres have been covered, so that there is ample scope for extension as necessity arises. The buildings that have so far been put up include a large garage capable of accommodating eighty cars, a machine shop, body and painting department, stores, engine room—in which a 50-h.p. gas engine, using producer gas, and dynamo are installed—offices &c., while in addition there is a large yard, with concrete paving, for trial purposes. A feature of the works is the well-arranged storeroom, from which duplicates of any part of a Fiat car can be supplied on the shortest notice from the smallest bolt even to a new frame or a complete engine. The machine tools installed are of the very latest type, and are kept busily employed under the direction of Mr. A. Preen, the work's manager, in keeping up the supply of the smaller spare parts, the larger duplicate components being furnished by the factory in Turin. The general idea has been to so equip the works that no

matter how badly damaged a car may be, it can be repaired and renewed so effectively that in every respect it may be said to be exactly in the same condition as when first manufactured, while one feature likely to give confidence in the company is that no repair work is put in hand without an estimate being first given to the owner of the vehicle. Altogether the new establishment is laid out on thoroughly practical lines, and forms another tribute to the enterprise of those at the head of the Fiat Motors, Ltd.

Lights on Vehicles.

LAST week we gave some interesting information with regard to the attitude of the local authorities towards the new Lights on Vehicles Act. That these bodies should recognise the value of the measure is important; that the police should realise their duty in enforcing its provisions is even more desirable. Already they have commenced their campaign in some parts of the country, and at the Bromley (Kent) Police Court several cases have already been heard in which those in charge of horse-drawn vehicles have been magisterially warned as to the consequences of neglect in the matter of lights. Fines have also been inflicted.

The Present Discontent.

IN our issue of the 25th ult., referring to the present controversy among the various organisations concerned with Motorism, we expressed the hope that steps would quickly be taken to bring about some amicable understanding, as the prevailing position could only result in ultimate harm to the general welfare of the movement. Reference was also made to the leaders of the Manchester A.C. having expressed a strong desire to secure such a result. The efforts that have been and are being made are being generally welcomed. At a meeting of provincial clubs which have not yet decided upon their future course of action, held last week, it was resolved to approach both the R.A.C. and the M.U. to this end, and it was resolved that both bodies should be invited to appoint a special committee to attempt to find the solution of the differences now existing. We understand that the club has accepted the suggestion, and proposes that the conference shall be held on Monday next, its representatives including Mr. C. D. Rose, M.P., and other members skilled in diplomacy, whilst in addition Sir John Macdonald, K.C.B., and Sir W. Goff, Bart., have been invited to attend as representatives of Scotland and Ireland respectively. In this connection it is interesting to note that the election of Mr. Joynson-Hicks to the chairmanship of the Motor Union was proposed by Mr. T. W. Grace, who has taken a prominent part in the attempt to secure a working arrangement between the two bodies as opposed to the open hostility which is now a dominant note. The statement that "peace in motordom" is to be the object which the new chairman of the M.U. will endeavour to obtain, is accepted in many quarters as giving a possible clue to the measure of success likely to follow the present well-intentioned and well-directed efforts towards reconciliation.

Proposed Motor Road.

THE proposed Motor Road from London to Windsor was opposed by the London United Tramways Company before the Examiner for Standing Order Proofs, who pointed out on Tuesday that the Bill raised a novel proposition. While there was no real physical difference between a motor road and an ordinary road, yet there was a difference in the use to which it was intended the road should be put. The novelty was in the attempt to combine in one scheme two works belonging to different categories, *i.e.*, roads and terminale, to each of which different Standing Orders applied. It might be that they were at the beginning of a new chapter of industrial activity in regard to motor roads, and it was very important that this should be considered by the authorities. Further, questions of public safety, and so on, might be raised, on which different views might be taken, which rendered it all the more important that the fullest informa-

tion should be supplied to persons locally interested in the methods by which the promoters proposed to carry out their scheme. He did not think the centre line on the deposited plans did convey sufficient information of the intentions of the promoters to construct a motor road with a tram line on either side; and while it was no part of his duty to say how plans should be prepared, yet sufficient evidence had been given to show that they might have been treated in another way. Under those circumstances he considered it his duty to report the Bill for the further consideration of the Standing Orders Committee.

Changes in Car Ownership.

71148J

In a report presented to the Warwickshire County Council the county treasurer has acknowledged the sum of £96 paid in connection with registration and licensing fees under the Motor-Car Act, 1907. The details may afford an index to those interested in the sale and purchase of cars as to the trend of trade. During the last three months of 1907 thirty-seven cars were registered and no fewer than thirty-two were notified as having changed owners—an indication of the extent to which the business in second-hand vehicles has grown in proportion to the trade in new cars. The owner of a small-powered car of one

cially after weeks of rain and much traffic. Its duration will not be more than two years, whereas considerations of economy seem to require a greater degree of durability. Hence the many "binders" which have been introduced to go down to the very root of the evil. These are almost as plentiful as non-skids, and many will find practical demonstration on the great highways during the coming season.

Petrol into Drains.

WITH vigour and alertness the Public Control Committee of the London County Council is prosecuting a campaign against all who they discover contravening the regulations with regard to the discharge of petrol into drains connected with the sewers. The dangers of such a practice have been set forth to our readers from time to time, so that we need not now do more than mention that in a case just heard at the Marlborough Street (London) Police Court petrol mixed with paraffin had been used for cleaning a motor-car, and that it was also allowed to run into a drain. No defence was raised, and a fine was duly inflicted. It would be more economical, however, to remember the risks to others that are involved in such practices—often the result of thoughtlessness. In our issue of August 17th last we

Pons on the Sizaire-Naudin Car with which he is taking part in the New York-Paris Run.

year is a potential owner of one of greater size and power in the following season. This has become a truism, and is largely responsible for the number of alterations in registrations, almost reaching that of new cars in such typical counties as that of Warwickshire.

Dust and the Roads.

By common consent it is agreed that the tarring of road surfaces is the most successful of the temporary palliatives now available for the reduction of the dust nuisance. It is also recognised that the cost of treatment can, by the employment of mechanical means, be brought down to a very small amount. These two facts have not prevented the introduction of a number of special systems, some of which have merits sufficiently distinctive to warrant a close study of their claims to the recognition of the authorities. Probably the present year will see many new preparations brought forward; for, although tar when applied hot under favourable circumstances gives good results during the dusty season, it is not forgotten by many authorities that tarred surfaces often result in disagreeable, black, muddy roads during the winter months, espe-

dealt very fully with the efforts made by the L.C.C. to deal with the matter and trust that their endeavours will be thoughtfully and thoroughly supported by the trade.

THE London and North Western Railway Company is arranging to start a service of motor-buses between Boxmoor Station and Hemel Hempstead, a distance of about two miles.

THE reliability of the motor-car needs no demonstration to motorists, but there are still many doubting spirits who hesitate to believe that a car can be relied upon for a place-to-place journey as thoroughly as a train. As an instance of what can be done Captain Ainsworth, of Hazlemere, Bolton, left Hurstpierpoint, in Sussex, on his 30-h.p. Beeston-Humber, after breakfast one morning recently, and, travelling by way of Leatherhead, Aylesbury, Coventry, Lichfield and Warrington, arrived at Bolton the same evening, having covered the whole distance without a halt save such as were necessary to satisfy the requirements of the inner man. Moreover, Captain Ainsworth adds that he had only to come off the top gear once, and that he has run his car upwards of 7,500 miles, during which time he has never had any mechanical troubles.

FROM PARIS TO VIENNA BY MOTOR-CAR.

THE following lines are simply a brief record of a motor trip on a 8-10-h.p. Darracq two-cylinder voiturette, made between the two great cities of Paris and Vienna. The trip was taken by two Austrians, one a writer on the "Allgemeine Automobil-Zeitung," the other a well-known motorist, Herr Koch, of Vienna. The object of the tour was to demonstrate in a conclusive manner that such a trip could be easily and comfort-

The Level Crossing at Parkersdorf.

ably accomplished on a car of the smallest size, and, moreover, completed within four days without any undue exertion or fatigue to those on the vehicle. Hitherto such a journey would not have been undertaken on any car of less than about 16-h.p., as the total distance between the two capitals is 890 miles, and the road winds up and down mountains which demand most careful handling of the vehicle. In fact, much surprise was expressed *en route* that so small a vehicle as an 8-10-h.p. Darracq could satisfactorily overcome such hill-climbs, still maintaining a very good average mileage per day. Nevertheless, this was done, and the little car sailed into Vienna four-and-a-quarter days after leaving Paris—none the worse for its long trip and long daily runs.

A start at sunrise was made from the French capital, and, though Parisians are not early risers, a small crowd soon collected round the vehicle as it stood at the front doors of the Grand Hotel. Fuel tanks were filled up, supplies taken on board, and substantial portmanteaus strapped on behind, and then the inevitable photographer made his appearance, and we made our peace with him by submitting to the ordeal of being "taken." A hearty shake of the hand, the waving of hats and handkerchiefs, and we were soon on our long journey, with light hearts and determination to get there *coute que coute*. We nearly came to grief, however, within the first thirty minutes of our start, as a large car in front of us slewed round in an alarming manner and without any warning. Mr. Koch, however, skilfully avoided the car, and we saw the vehicle side-slip into the kerb and smash a front wheel. Further on two men in blue had stopped another vehicle and were taking the necessary notes for a prosecution for the emission of too much smoke at the rear.

It took us a long time to really get away from Paris, as the fear of losing our way made us go cautiously, and frequent stops were necessary to ascertain the route. We finally struck the main road to Belfort, and were glad to get off the *pave*, which shook us up a good deal. We were, of course, now going fairly fast, as we had arranged to sleep at Vesoul that night, a distance of 360 kilometres (about 225 miles), and had no time to waste. We were thankful, therefore, to reach one of the *routes nationales*, which are undoubtedly the finest roads in the world. We passed through Champigny before the town was up, and here really began our run to Vienna over the same road as that taken by the racers in the Paris-Vienna race. The solitary inn in this

town was the starting-point of that historic event in automobilism, and as we flew by we recalled the early morning of 1902, when the monsters were sent off on their mad rush to Vienna from 3.30 a.m. onwards.

We hardly saw any horse traffic between the towns and villages *en route*, as these ancient means of locomotion are fast dying out. Motor-cars and cyclists monopolised the roads—large and small vehicles, of varying horse-powers and dates, passed and repassed us all the time. Some, indeed, were old stagers, dating back some six or seven years at least; but even these old types had modern luxuries attached, such as wind screens, Cape cart hoods—in fact, they had been brought up to date in every respect, with the exception of the engine and coach work. Their day's work was not yet done, although they were out of fashion as far as design is concerned.

The French Touring Club is worthy of some special mention, if only for the admirable sign-posts it has had erected all over France. To lose one's way on the main road is a difficult feat, as the direction-posts give the desired information, and no more. The first sign-post, pointing to Belfort, is exactly on the outskirts of Paris, and the last, which refers to Paris, is practically on the French frontier. The intermediate ones are five kilometres apart (about three miles) and the inscription is on both sides of the direction-arms. The arm pointing to Paris gives the distance to the city, and the other arm the distance from Belfort, and we saw at a glance how we were progressing, and were able to take the time of each five-kilometre run. The danger signals also are not to be despised, although many of them are erected at the expense of motor tyre firms, and thus serve a dual purpose—a warning about a level-crossing or sharp turn and also an injunction to buy and use so-and-so's pneumatic tyres. Level-crossings are undoubtedly dangerous items which one meets with on the Continent, the gates across the road being shut a long time before the train is really due to pass, and if one is driving fast over a difficult and twisty road it is easy to crash through one of these gates, which, unfortunately for the motorist, are usually made of iron.

Troyes was the next large town we passed through, and here we had a sample of the dust nuisance. A large car raced

The Gateway at the Entrance to Salzburg.

past us at great speed and literally smothered us with mother-earth. We were not the only ones to suffer, as there were plenty of pedestrians around, dressed in their Sunday best. Motor-cars themselves are cheerfully tolerated in France, but dust is not, and something will have to be done to put a stop to this nuisance. A steep ride to Langres, which the car easily accomplished, was a test for the motor, and a long descent on

(To be concluded.)

The first time the vehicle was taken up this hill on top gear it was driven by the well-known motorist, Mr. E. Campbell-Muir, and from the fact that this was the first occasion on which he had handled a Sheffield-Simplex, an idea may be gathered of the simplicity of control that has been incorporated in its design. We may add that the engine comprises six cylinders $4\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, giving, according to the R.A.C. rating, 48.6-h.p.

The Coltman 20-h.p. Car.

SOME few particulars of the new car lately introduced by Messrs. H. Coltman and Sons, of the Midland Iron Works, Loughborough, have already appeared in the *M.C.J.* A few days ago we had an opportunity not only of making a trial run on one of the new vehicles, but also of visiting the works in which they are being built. Messrs. Coltman are an old-established firm of engineers and boiler makers, and their object in taking up the construction of automobiles has been more with the view of building a car that shall earn a reputation for reliability of the various parts, than one which shall contain a large number of departures from what may be termed the standard design.

At present attention is being confined to a single model of 20-h.p. The frame is of a special section of pressed steel, manufactured by Messrs. Coltman in their own works, and so arranged that the protecting undershield can be readily fitted or detached. The side members on which the engine and gear-box are directly supported are straight throughout their entire length.

Although rated at 20-h.p., the four-cylinder engine (Fig. 3) has been tested to develop 23-h.p. at a speed of 1,000 revolutions per minute. The cylinders, which are cast in pairs from a specially hard quality of iron, are 4 in. bore by $4\frac{1}{2}$ in. stroke. The inlet and exhaust valves are all located on one side, and operated off a single cam shaft. An interesting feature of the engine design is the ease with which the valve tappets can be taken out. The tappet guides are formed in pairs with

without the use of special tools; the lower ends of the valve stems are screw-threaded, as is also the small disc interposed between the lower end of the spring and the cotter pin, so that by screwing up the disc the pin can be withdrawn by the fingers. The cams, which are formed solid with the shaft, are of such design that the valves are rapidly opened to their full extent, allowing, in the case of the inlets, a full charge of gas to be drawn in, and, as regards the exhaust, permitting the burnt gases to be quickly dispelled. The half-time gear wheels and the pinion which drives the magneto are enclosed in an extension of the base chamber. The inlet and exhaust pipes are so arranged as to allow of free access to the valve springs, spindles, &c. As will be seen from Fig. 4, the crank shaft is slightly *desaxe*, that is, set slightly out of the centre line, towards the cam shaft, this offsetting being claimed by many designers to reduce the friction between the cylinder walls and the pistons. The crank shaft is supported on three long bearings of a special

quality of phosphor bronze, for which the makers claim a much longer life than usual, reducing the necessity to dismantle the engine for re-bushing purposes to a minimum. The big ends of any of the connecting rods can also be inspected by removing the corresponding section of the cam shaft cover. The pistons, which are $5\frac{1}{4}$ in. long, are provided with four rings. The heads of the pistons are concave in shape, with the view of increasing the piston area.

The water circulation is on the thermo-siphon or gravity

Fig. 1.—General View of Coltman's 20-h.p. Car.

Fig. 2.—Plan of Chassis of Coltman's 20-h.p. Car.

a plate which constitutes part of the cam shaft cover, and is held in place by a single set screw. There are four detachable plates, which, when all are in position, entirely case in the cam shaft. In addition to the tappet guides the plates have pivoted to their lower side the short levers which are interposed between the cams and the tappets. The valve springs are so arranged that they can be detached

system, no pump being employed. The water-circulating pipes are of extra large diameter, and a noteworthy point is that no rubber hose is used in making the joints. The radiator, which is furnished with a belt-driven air-inducing fan, is of the framed ribbed tube type, while the bonnet is built up of two panels, which can be readily removed and replaced in position. The lubrication of the engine is maintained by the pressure of the

exhaust gases acting on the oil contained in a small tank located under the engine bonnet. The engine is, however, so arranged that a positive system of pump lubrication can be fitted if this method is preferred.

The carburettor is of a special type designed to give a perfect mixture at all engine speeds; the automatic air valve is provided with a mercury-glycerine dashpot. Two systems of ignition are provided—high-tension magneto and coil and accumulators. The magneto is one of the smallest we have so far seen on a four-cylinder car; in fact, it is a single-cylinder one, the current generated being sent to the different cylinders by the same high-tension distributor as is used in conjunction with the accumulator system. The distributor and contact maker are mounted on the upper end of a vertical spindle just behind the radiator, and driven by worm gear off the cam shaft. The ignition is advanced and retarded by a lever mounted, like that controlling the throttle valve, above, but not turning with the steering wheel. The petrol tank is located at the rear of the chassis, the fuel being supplied to the carburettor under pressure.

The clutch is of a new metal-to-metal design, having very large wearing surfaces and mounted on ball bearings. It comprises five cast iron shoes, the outer surface of which is of a

Fig. 3.—General View of Coltman's 20-h.p. Motor.

curved shape corresponding to the drum formed in the flywheel, the shoes being forced outwards by means of a cone operated by the pedal. A universal joint is introduced in the shaft between the clutch and gear-box to allow for any want of alignment of the two parts, and to permit of either being dismantled without interfering with the other.

The change-speed gear (Fig. 5) is adapted to give four speeds forward and a reverse with direct drive on top speed; it is controlled by a lever working in a "gate," a special locking device, in which no springs are used, being provided in connection with the controlling bars, so that it is impossible for any two gears to get into mesh at the same time. The whole of the controlling mechanism is contained in the gear-box, while the reverse pinion only rotates when the reverse gear is being used. The shafts are extra large in diameter and very short in length, and are fitted both with ball thrust bearings and ball journal bearings, the latter being of very ample proportions. The construction of the gear-box is such that, if necessary, the two shafts can be taken out from above.

From the gear-box the power is transmitted to the rear axle through a cardan shaft and bevel gear. The live axle (Fig. 6) is enclosed in a special steel casing from end to end, built up without any brazed joints; the sleeves are also fur-

nished with webs at their outer ends to give greater strength. The construction is such that the whole of the differential gear may be lifted out without removing the axle or the road wheels from the car, it being simply necessary to remove the hub caps

Fig. 4.—Transverse Section of Engine.

and slightly withdraw the two halves of the axle. The differential casing is provided with a large horizontally-arranged detachable cover. The axle proper and the gears are made of nickel steel and fitted throughout with both ball-thrust and journal bearings. The power is transmitted to the road wheels through dog clutches in the hubs, so that the weight of the car is not carried by the rotating axles, but by the casing surrounding it. The torque of the rear axle is taken by two special radius rods fixed to and extended from the axle casing, near the brake drums, to the frame, the forward connection being through a joint which allows movement in all directions, and is on the same centre line as the universal joint behind the gear-box. The front axle is of H-section forged steel. The steering gear (Fig. 7) is of the worm and quadrant type, fitted with double thrust ball bearings; it is so designed that all adjustments can be made at the top of the steering lever. The latter works on a ball journal bearing, this being mounted inside the steering box, the whole arrangement being dust proof

Fig. 5.—Sectional Plan of Gear-Box.

and working in oil. A useful feature lies in the fact that the steering column can be fixed at any angle to suit the driver. As regards the brakes, which are all of the double-acting metal-to-metal type, the usual arrangement is, in the Coltman car, reversed,

a pedal actuating internal expanding brakes working inside drums attached to the hubs of the rear road wheels and the hand lever a wide contracting brake at the rear of the gear-box. The rear brakes are provided with a compensating device, so that each

Fig. 6.—Sectional View of Half of Rear Axle.

is equally applied. The brake drum is made of special cast steel and the expanding friction bands of special spring steel with cast iron linings. All the parts of the car are made to gauge on the interchangeable system; while another good point is that few, if any, castings are employed in the chassis, the makers preferring to use forgings, which, although more costly, give much greater satisfaction both to the builder and user. The chassis complete and ready for the body turns the scale at 16 cwt. 2 qr.; the wheel track is 4 ft. 7 in. and the wheel base 9 ft. 4 in., enabling any type of side-entrance body to be fitted.

In the course of a short run on the car we had ample evidence of the general quiet running of the vehicle as also of the flexibility of the engine and the satisfactory operation of the clutch. The streets of Loughborough are extremely narrow and render progression at anything exceeding a crawl practically impossible; notwithstanding this, however, our journey to and from the station was done entirely on the top gear. Unfortunately time did not permit us to test either the speed or the hill-

Fig. 7.—Details of Steering Gear.

climbing qualities of the car, but we understand from Mr. W. Wilson, the designer, that several extended runs on the hilly roads of Derbyshire have proved the vehicle to be quite satisfactory in both these respects.

SOME USEFUL NOTES.

IN the event of a stoppage in the petrol pipe from the tank to float-chamber of the carburettor, the union may be unscrewed and the rubber end of the tyre pump connection pushed over the end. A few sharp strokes of the pump will usually remove any grit or debris in the pipe.

CARBURETTORS in which adjustment is provided for the amount of petrol supplied to the jet very often require readjustment when a different grade of petrol is used. This should be carefully noted, as frequently erratic running arising on this account has been wrongly attributed to other causes.

MECHANICAL lubricators occasionally strike work, although nothing deranged can be found in their mechanism. In these lubricators, where a gauze is used to filter the oil to the suction pipe of the little pump, close inspection will generally reveal that the gauze has become choked, and that little or no oil is reaching the pump.

IN the case of a slipping leather cone clutch a little Fuller's earth will prevent the trouble for the time being; when the car reaches home a good dose of castor oil well rubbed in will make all good. If no Fuller's earth can be procured, a little dust or very fine sand will do, but care should be taken to clear away all traces of the same on getting home.

A VERY simple way to keep the feet warm on a car is to simply wrap them in a rug. Those who have not used them should try side doors in front of their cars, they prevent an immense amount of draught, and are inexpensive to fit. Wool-bordered cocoanut mats, about 1½ inches thick, add greatly to the comfort and appearance of a car; they also deaden all noise of the transmission gear.

POPPING in the carburettor indicates a weak mixture; that is, not enough petrol for the amount of air introduced into the vaporising chamber. Explosions in the silencer indicate that the cylinders are firing irregularly and the unfired charges pass through the exhaust pipe into the silencer, being ignited there by the heat of the next explosion. A weak battery is sometimes also the cause of this.

ABOUT the last thing on a car that is apt to be considered in need of attention is the silencer; yet obstruction of this necessary device with soot and carbon deposits is a fruitful source of reduced power. A cutout is a good check on silencer condition, for if the increase in power occasioned by its opening is unduly marked, choking of the exhaust box passages is clearly indicated. Ever so often a silencer should be cleaned, careful observation of the car being sufficient to give an indication as to when this should be done.

ONE of the inconveniences of the spring washer so commonly used in automobile construction is its short lease of usefulness. As the nut is screwed down upon it, it gradually loses its elasticity, and finally snaps, and is then little better than nothing. However, no motorist need despair if he has any twine with him. The twine should be formed into a loop just smaller than the washer, and the end wrapped over this loop, forming a grommet. Put it in place, screw down the nut, and you have a washer that will hold the nut and cannot be broken or split.

IN some cars rubber hose is employed in the connections of the water-cooling system, and some of the turns which the hose is forced to make are quite sharp. Oftentimes it is almost impossible to prevent the rubber pipe from acquiring a kink at these points and very much contracting or nearly closing the tube, thus causing a sluggish circulation. An effective method of distributing the bending and preventing the tendency to kink and close the passage is by rather tightly winding the hose with moderately fine tinned steel binding wire for some little distance upon each side of the point where the kinking tendency is manifested. Quite a number of cases of faulty circulation have been cured by improving the rubber connections by this treatment.

THE ELEMENTS OF THE FLYING MACHINE.

BY H. WAYMOUTH PRANCE, A.I.E.E., A.M.I.A.E.

THE advent of the successful flying machine is being awaited with interest by many people, but with the constant announcement of the production of such a machine, which never seems to really materialize, one is apt to become sceptical, and even, in the case of a large number of people, to doubt if the problem of aerial navigation will ever be solved. Fresh interest has of late been aroused by the recent success of Mr. Henry Farman, and those motorists who would be thoroughly up-to-date must needs consider these early struggles of the sport of the future—which may now be said to have reached the “toddling” stage—struggles which call for the assistance of the automobile engineer in the design and construction of the light-weight motor, in which assistance the experience gained with the motor-car is of inestimable value.

In order to appreciate the difficulties which beset the path of the would-be flyer, it is necessary to consider the elements of propulsion through space, and bearing these in mind, the lines upon which experimenters are working to overcome these difficulties will readily be understood. In flying, two efforts

sented by the propelling force in the form of screw propellers mounted on horizontal axes, and the weight of the mechanism necessary to drive them. It should further be remembered that the reaction of the wind pressure upon a flat surface inclined to that pressure at a slight angle is at right angles to the surface, from which it will be seen that a very small horizontal effort will procure many times its value in vertical or lifting effort.

This method of sustaining a body in the air by the reaction of the air pressure upon a plane surface requires, as do the other methods, motive power, and it is this question of power that has placed a great stumbling block in the way of experimenters since the earliest attempts at flying were made.

Certain devices have been constructed wherein human power was relied upon to provide the necessary propulsive and even lifting effort, but such were foredoomed to failure, and resort is now universally made to mechanical power in some form or other. In the case of the apparatus under consideration it is, perhaps, more necessary than in any other self-propelled vehicle that every attention should be given to the compactness, reliability, disposition of weight, and lightness of motor, and thus it is that the experimenter of to-day has great advantage over his predecessors. I have before me some early literature upon the subject, wherein this matter is particularly mentioned, and wherein is stated the desirability of a light, compact and easily

Motor Cycle Carriers for Mail Collection Purposes.

The above illustration depicts the motor-cycle carrier which is at present being experimentally tried in the collection of letters from pillar-boxes by the U.S. postal authorities in Washington.

have to be maintained—a lifting effort and a propulsive one; the former of these may be obtained either by means of a gas balloon, screw-propeller blades, bird-like wings, or by the action of an aeroplane, of which the first might almost be said to have proved its unsuitability for practical use in any but the stillest atmospheres. Hence we have to resort to the “heavier than air” apparatus, in which mechanical movement is required to overcome the force of gravity, and thus we require a motive power of some sort or other. As regards propulsive effort, bird-like wings and screw propeller blades are the principal devices that have been employed, and for this purpose also we require a source of power, and it is here that the motor-car, with its light and compact petrol engine, has done so much in paving the way for the practical flying machine.

It is upon the aeroplane that many inventors base their hopes; and certainly, judging from the results of the experiments which have been carried out during the last few years, the greater possibilities appear to lie in this field of operation. In order to understand the principle of this apparatus one should bear in mind the kite, in which a practically flat surface is caused to oppose the wind by a string, the pull upon which may be resolved into forces acting in a horizontal and vertical direction, these forces in the case of the aeroplane being repre-

handed motor, the description thereof, indeed, being in closer resemblance to the petrol engine of to-day. In the past, steam engines have been employed in one or two notable instances; Maxim's machines were driven by this form of energy, the power plant in this case weighing some 10 lb. per horse power, with an engine developing 360-h.p.—as against the 3 lb. per h.p. of the specially constructed modern petrol engine—but, although these engines were marvels of engineering ingenuity, they cannot be compared in the all-important features of compactness and lightness with the petrol motor. Thus it is that with the advancement of aerial navigation a new field is opened up for the internal combustion engine—a field of vast proportions and unlooked-for possibilities, which serves to give a personal interest in the matter to every professional motorist, whether he be a motor-bus driver or an engine designer; and whilst progress in such a science as aviation must necessarily be slow, the ultimate success is undoubtedly assured.

ELSEWHERE in the present issue we give some extracts from the pamphlet recently issued by Messrs. A. Darracq and Co., describing an interesting run from Paris to Vienna on an 8-10-h.p. Darracq car.

CONTINENTAL NOTES.

Military Motor Vehicle Trials in Germany.

The Experimenting Section of the Prussian Transport Service are about to carry out some trials in the neighbourhood of the Harz mountains with a number of motor vehicles designed for the transport of both passengers and goods. The machines to be tested include several five to six-ton German Daimler wagons, a lorry, and an omnibus, a Siemens-Schuckert motor road train, and a Fowler steam tractor with a couple of trailers.

A Hill Climbing Competition in Algeria.

The Algerian Automobile Club is organising a hill climbing contest for February 9th; it is to be held on the Medea Hill, on the road between Algiers and Laghouat; the average gradient is one in twelve and the distance to be covered 12 kilometres. The competitors will be divided into classes on a cylinder bore basis. The Algerian Club also proposes to hold a speed trial in March next, and a consumption test in April.

Motor Scouts in Paris.

The Association Generale Automobile inaugurated its service of motor scouts in Paris on Saturday last. At present

circuit as last year. Three Panhard cars have been officially entered for the race; the vehicles will be driven by Messrs. Heath, Cissac and Maurice Farman. The number of cars which have now been definitely entered for the event is twelve. It is reported that the Westinghouse Company have decided to take part in this year's race.

Public Services in France.

A public motor-car service is to be established during the coming season between Briangon and Bourg d'Oisans, France. The vehicles to be employed will be of the De Dietrich type. A company has also just been formed in St. Raphael (Var) with a capital of £12,000, and the title of La Société de Traction Automobile du Littoral, to run motor vehicles in the public service in that district.

Motor-Car Builders and Flying Machines.

M. Leon Bollée, one of the oldest motor-car builders in France, is reported to be engaged on the construction of a flying machine at Le Mans. The Clement-Bayard Company are also stated to have secured an order to build one for a Russian gentleman.

Three of the Motor Scouts who have just been placed on the roads round Paris by the Association Generale Automobile.

a dozen men dressed in a suitable uniform and equipped with bicycles are patrolling the principal thoroughfares warning motorists who are travelling too fast, and whose cars are emitting smoke, the latter being an offence to which the Parisian police are just now paying considerable attention.

Motor Vehicles for Military Purposes.

The French military authorities have, it is announced, just placed an order for five Mathian-Cobendet petrol motor-lorries. The vehicles, which are to be despatched to Morocco for use by the Commissariat Department for the transport of supplies between the military railway station of Turenne and the Oujda outposts, will have a capacity of from 2 to 3 tons.

The A.C.F. Grand Prix Race.

As was announced in the *M.C.J.* last week, the Seine Interieure circuit has again been adopted for the A.C.F. Grand Prix race. The starting point is, however, to be altered, and will this year be located on the other side of, and about half a mile from the fork near Dieppe, on the way to Euverne and Londinières. According to the present plans the grand stand and car enclosures are to be inside and not on the outside of the

Miscellaneous Items.

It is reported from Madrid that arrangements are being made to organise a race for voiturettes between that city and Lisbon, to be held during the coming summer.—A 40-h.p. Fiat motor-bus has just been placed in service in Prague, Bohemia, by the municipal authorities of the town.—The annual automobile meeting at Cannes is to be held from the 8th to the 15th March next.—The French Chamber has adopted a bill the object of which is the reduction of the price of denatured alcohol for commercial purposes.—Last year's Herkomer Touring Trophy competition resulted in an addition of £1,000 to the funds of the German Imperial and Bavarian Automobile Clubs.—A 15-20-h.p. Werner car driven by M. Lelouvier left Paris last week on a tour round the world, *via* Alaska and Siberia.—The Roumanian postal authorities are making some trials with a motor-van in connection with the collection of the mail in Bucharest.—It is proposed to organise an automobile meeting at Naples during the coming summer.—A service of Darracq-Serpellet steam omnibuses has just been inaugurated between the Lyons and Saint Lazare railway stations in Paris.—The French Automobile Club is considering a proposal to establish a permanent motor-car racing circuit of about fifty kilometres in length.

THE Dundee Lifeboat Committee have decided that the Broughty Ferry station is a suitable centre for a motor-lifeboat to be placed.

THE receipts taken on the Eastbourne motor-omnibuses for the week ended 25th January were £104 5s. 8d., the number of passengers carried being 19,693.

AN Employers' Association for the engineering trade in Coventry is being formed, and twenty firms interested in motor and general engineering have expressed their willingness to join.

HAROLD COLLINGE, a young man who figured in the Cambridge card case, came into a fortune of £22,000, much of which has gone in motor-cars. He is now said to be acting as a "gentleman chauffeur."

ACCORDING to a newspaper man who has been visiting Mexico, there is likely to be a good market for British automobiles in that country—when British makers more adequately realise its needs than is now the case.

HIS ROYAL HIGHNESS PRINCE ALEXANDER OF TECK has placed an order with Clement-Talbot, Ltd., for a 25-h.p. Talbot limousine. The body, which will be built by Rothschild, will be carried out in dark green with upholstery to match.

THE first 10-12-h.p. Fiat motor-car was officially passed by the Scotland Yard authorities on Tuesday last. The vehicle, which is fitted with a four-cylinder motor cast *en bloc*, has an exceedingly wide lock, it being capable of turning in a circle 23 ft. in diameter.

A NEW amusement of some lads engaged in the City of London has been brought to light at the Mansion House Police Court. In Cannon Street they take the numbers of passing motor-omnibuses and bet with each other according to the numbers—whether high or low.

A MOTORIST has been summoned at Nottingham to recover the alleged value of a dog which was run over by his motor-car. Giving judgment His Honour said the motorist ought to have exercised more care, but he did not agree with the estimate of the value of the animal and gave judgment for 15s.

EXPLANATORY of the Lights on Vehicles Act, 1907, to which we made reference in our last issue, is a pamphlet published by Messrs. Sealey, Bryers and Walker, Dublin. This is entitled "When to light up," which has been compiled by Mr. D. O'Leary, setting forth the provisions of the Act, with explanatory notes, and a lighting up table for the year.

A NOVEL motor race took place on Saturday, from Leagate, near Preston, to Lytham, to test the slowness of motor-cars. There were eleven entries, but seven dropped out before half the journey was covered, only four finishing. Mr. Fred Halsall, of Fleetwood, was declared the winner, covering a mile and three-quarters in one hour and thirty-four minutes.

ONE of the most attractively-pictured books that has lately come to our office is that entitled "Six weeks and the Mediterranean," just to hand from Messrs. George Philip and Son, Ltd. This tells of leisurely travel by steamer, camel, donkey, rail, and, in fact, every form of locomotion except the motor-car. It suggests new ground for the venturesome motorist, and tells of delights of travel along the Italian coast, over the roadways of Pompeii, in the classic land of Greece, and then to Turkey, with the accompanying dogs of Constantinople, finishing by way of the Nile into the historic scenes of Egypt—altogether a delightful tour, delightfully described, and delightfully illustrated.

AN excellent specimen of commercial literature is the new catalogue of Napier motors issued by Messrs. S. F. Edge, 1907, Ltd. This comprises a history of the Napier car, an argumentative chapter on the merits of the six-cylinder Napier, some interesting illustrations showing various official tests in which the engine has done well, descriptions of the numerous special features of the cars, some snapshots of the Glidden tour, and a list of owners of the vehicles, in which Parliamentarians as well as Society people figure largely. We note that Mr. A. J. Balfour has had no fewer than seven Napier vehicles, a conspicuous example of loyalty to his first automobile selection.

IN the George Hotel yard, at Burntisland, N.B., Mr. Andrew Maxwell has an excellent motor garage with facilities for repair work.

AT Teddington and also at Godalming the local authorities

are putting up signs near schools warning motorists of the presence of such establishments in the vicinity.

THE Danish Automobile Club has applied to the secretary of the Royal A.C. for particulars of the method of examination for drivers, and the necessary forms and record books.

THE cab proprietors in the city of Newcastle-upon-Tyne have petitioned the Watch Committee of the City Council asking them not to sanction the use of passenger motor-cars in the city.

A MOTOR Vehicles Bill is being introduced into the Legislative Council at Adelaide (Australia), by which it is sought to reduce the speed of motor vehicles to ten miles per hour in the town and four miles per hour over any level crossing.

THE Bridgwater Motor Company are extending their garage in Eastover and erecting a new building, which will be devoted solely to repair work. Mr. Harry Carver is the managing director of the company, which is doing a large business even beyond the borders of Somerset.

The new two-seated Standard Car which is being used by the Standard Motor Company, Ltd., in visiting motor-car agents in different parts of the country.

THE magistrate at Woolwich Police Court has advised a firm who employ several motor vehicles in their business to have speedometers fitted to enable the drivers to ascertain the speed at which they are driving.

A DEPUTATION from the Parliamentary Committee of the Trade Union Congress has waited upon Mr. Herbert Gladstone, the Home Secretary, to urge that the inspection of public carriages should be carried out by experts who are not only skilled with regard to vehicles generally but particularly in motor matters. The Home Secretary replied that he was not aware that the case for a change had been made out. In London inspection was efficient and satisfactory, and with regard to motor-vehicles the difficulty in giving effect to the proposal was too great to admit of its being adopted at present.

A PARTY of five motorists returning to Blackpool in the fog were saved from a serious disaster through the timely intervention of a Garstang girl. Just below St. Thomas's Church, Garstang, an open space leads to the canal wharf, and the chauffeur, mistaking the road in the darkness and the fog, steered his way down this at a good speed. Hearing the car approaching Miss Singleton rushed out of the buildings adjoining the wharf, and with lantern in hand ran in front of the car and screamed to the driver to stop. The brakes were jammed on and the party then realised that with a few more revolutions of the wheel they would have been thrown into eight feet of water in the canal basin.

LORD ST. OSWALD, of Nostell Priory, Wakefield, has lately acquired a 35-45-h.p. Maudslay car.

A PROTOS 30-h.p. car left Berlin for New York last week to take part in the New York-Paris motor run.

DURING the last three months of 1907, 102 motor-car drivers were licensed and 142 drivers' licences renewed by the Warwickshire County Council.

SEVENTEEN horse-drawn sixpenny taxi-cabs were put on the streets of London on Saturday, and daily additions to the service have been made throughout the week.

ONE urban, seven rural and forty-seven parish councils in Warwickshire have complained to the County Council of the excessive speed of motor-cars, and also of the damage done by them to the highways of the county.

MR. A. WILLIAMS' motor garage has been removed from 348, High Street, Lewisham, S.E., to 363 in the same thoroughfare. Not only is the new establishment well equipped for repair work, but there is a good stock of accessories, &c., while tyres are vulcanized and accumulators charged on the premises.

IN connection with the increasing use of industrial motor vehicles, Mr. J. Alderson, steam motor haulage contractor, of Stanley Road, Bootle, informs us that he uses two Mann steam motor wagons in connection with his business. They are designed to carry six tons, and are used with a trailer carrying a load of two tons, not only for removing furniture, within a sixty miles radius of Liverpool, but for various other work, such as transporting frozen meat from Liverpool to Manchester, and timber, hardware and general goods. As a rule the machines

are engaged the week through, making three journeys to Manchester and district, and conveying general goods back to Liverpool. Taking into consideration wages, repairs, fuel, &c., Mr. Alderson considers that the cost of transport by steam wagon is about 30 per cent. cheaper than by horse-drawn vans. The accompanying illustration depicts one of the motor-wagons with furniture van waiting for a trailer outside Mr. Alderson's premises preparatory to starting for Blackpool.

MR. CHARLES JARROTT was announced to make an attempt on the world's record for fifty miles, one hour, and 100 miles on his Lorraine-Dietrich car at the Brooklands track on Wednesday.

THE great variety of rubber goods manufactured by the Continental Tyre and Rubber Company, Ltd., is further emphasised by the fact that they now make a speciality of scientific india rubber balloons for meteorological purposes. Great efforts have recently been made to investigate the conditions of the upper atmosphere, and these balloons are manufactured of rubber sheeting specially prepared for this purpose. They have a diameter of two to three yards, and are provided with the necessary scientific apparatus and instruments to measure the atmosphere, humidity, direction and velocity of wind in miles per hour, and have attained in some cases altitudes of 60,000 feet. The self-recording instruments tell exactly the conditions of the atmosphere and give all the above particulars. Balloons manufactured by the company have been delivered to the Manchester University, Birmingham University, Royal Meteorological Office, and other institutions.

A FIRE has occurred at the motor repair works of Mr. Hugh Wright in Main Street, Auchnacloy, Dublin.

THE West Penwith Rural Council has obtained a dozen road signs from the Motor Union, which are to be put up to indicate concealed turnings in the district of Penzance.

THE Duke of Oporto, brother of the late King of Portugal, has just ordered a Stepney wheel for his 60-h.p. Fiat. An illustration of the Duke on his car was given in our last issue.

THE Ayr District Committee of the Ayrshire County Council has recommended that motor-cars should be mechanically controlled in such a way that they cannot exceed twenty miles an hour.

HITHERTO the Wandsworth Borough Council has had two Borough engineers, one for the Eastern and one for the Western divisions. The work is being reorganised and in future will be entirely controlled by Mr. Peter Dodd. To facilitate the carrying out of his duties the Council last week had submitted to it a proposal, that Mr. Dodd shall be allowed a sum of £250 per annum, in return for which he is to provide and maintain a motor-car. The Council, however, agreed that the figure should be altered to £300.

FROM the Standard Motor Company, Ltd., Coventry, comes a copy of the new catalogue of Standard cars that has just been issued. This is one of the most interesting lists we have received for a long time; not only are the different parts of the factory all illustrated by photographs, but the various types of chassis are similarly treated; in fact, so numerous are the illustrations that there is scarcely a part of the car that is not pictorially depicted. Two models are being made, 20 and 40-h.p., both being fitted with six-cylinder engines. Since Mr. C. Friswell took up these vehicles they have sprung into popularity, and are likely to be largely seen on the roads during the coming season.

"EVERY MAN'S OWN LAWYER" is a standard work of tried value which has stood the test of long publication. The new edition, just published by Messrs. Crosby Lockwood and Son, has been revised and brought well up to date. The last two or three years have been singularly prolific in legislation—a fact which has given the new volume special significance. The sections referring to excise licences, the regulation of highways, personal rights, and remedies, and certain commercial practices will be of particular interest to our readers, while an admirable index facilitates easy reference. The book will be of value to all who may ever be involved in litigation, or who desire to avoid that luxurious practice.

"THE best anti-freezing solution which we have found," states Mr. Howard E. Coffin, vice-president of the E. R. Thomas Detroit Company, "is composed of wood alcohol and water. The proportion of these will depend upon the temperatures to be encountered, but a mixture of 30 per cent. alcohol and 70 per cent. water will be very safe in any ordinary temperature. The alcohol-water solution has been found to be of greater value than the other mixtures, because it not only is capable of maintaining its liquid state at a very low temperature, but it is not harmful to any of the metal or rubber surfaces with which it comes in contact, as is the case with the many salt solutions in common use."

RECENTLY the Chicago Motor Club held a reliability run, in which ten contestants lost no marks. To ascertain the winner from that number a series of hair-splitting distinctions were made for the elimination of nine competitors. One of the perfect score cars lost because a judge put his hand on the brake drum and discovered it a trifle warm; another car lost its position because a bullseye in the lens of a lamp had fallen out; still another had its score soiled because it had been bumped by another car, and showed a slight dent as the result; while a fourth was marked less perfect than others because a speedometer bracket had become loose. But probably the most remarkable evidence of this critical discrimination was apparent in the case of a car fitted with a canvas under apron. After finding nothing against the car in any other respect, one of the officials discovered that a lacing to this apron had been slightly chafed. This was thought to be sufficient evidence against its "reliability" to put a black mark against it.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.]

THE RULES OF THE A.C.F. GRAND PRIX RACE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that a great deal of fuss has been made by the representative of an English firm in regard to the rule in connection with the Grand Prix event for this year, forbidding changing the wheels during the race. It has been made to appear that the rule in question has been passed with the sole intention of handicapping British entrants. Leaving aside the point that the firm in question is the only one which has used detachable wheels in connection with racing, I would like to point out that the rule to which objection has been taken has always been in operation in connection with the big French races. For instance, in the Paris-Berlin, Paris-Vienna and Paris-Madrid races the cars were always examined and stamped by an official of the Automobile Club de France before the start, and amongst the parts which were marked were the four road wheels, cylinders and axles, and it was not allowed to change those parts during the race, therefore the suggestion that the rule complained of is a new one, put in to handicap British entrants in the Grand Prix race for this year, is untrue and unsportsmanlike.

After all, racing has served, and no doubt is serving, a useful purpose in improving motor-cars, but if firms are to be allowed to change their

travelling. The detachable wheel could not be considered as an improvement, for I can hardly see the convenience of carrying two or three spare wheels about with one whilst travelling. The covers of the detachable rims are nuisance enough as it is. There was, therefore, no need to encourage a new accessory, which, although it may be interesting, is not practical in application.

I repeat that I do not know what reasons have guided the Automobile Club of France in making this prohibition, against which Mr. Edge has cried out so quickly—he is perhaps pleased to find an excuse to avoid crossing the Channel—but, whatever may be the reason for their decision, the A.C.F. were quite right. If one commenced on the principle which pleases Mr. Edge so much, why not also authorise changes of motor, of gear-boxes, or of differentials? Last year, when Duray on his Lorraine-Dietrich was stopped at the victorious moment by the breaking of a ball-bearing, he no doubt would have been pleased to have had a spare gear-box to hand in five minutes. No doubt it would be a mechanical improvement of considerable importance to be able to change any one part of the car in a few minutes, but it would be a useless improvement because not practical. We could not carry a spare motor or a gear-box about with us, any more than we could carry detachable wheels. The improvement imagined by Mr. Edge is of that

Motoring in Sumatra.—Crossing the Lau Tenga River.

[De Auto.]

wheels, I see no reason why they should not change other vital parts of the machinery. Let us have more racing and less protesting on the part of British firms alleged to be anxious to take part in foreign events. I am sure that the entry of British cars in the Grand Prix would be welcomed in France, and I am equally sure that each car would have an equal chance with its French competitors. What I cannot understand is, why this old racing rule should be specially held forth as being particularly detrimental to the British industry in general, and one British firm in particular.—Yours truly,

CHARLES JARROTT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The arrangements being made by the Automobile Club of France with regard to the Grand Prix to be held in the month of July next are being subjected to attack by some of the English constructors, against which I consider it my duty to protest personally. Mr. S. F. Edge, amongst others, has made it known with much fuss that he will not enter for the Grand Prix because the rules do not permit the use of detachable wheels. I do not know whether the Automobile Club of France has had any after-thought in making this decision, but I consider that in principle it is fair and reasonable.

As a matter of fact, the end in view for this race is to lead to improvements, which will then be applicable to the cars which we use for

kind which practical industry cannot adopt, and for that reason alone the A.C.F. has done well not to allow it in the Grand Prix.

I trust, sir, that you will receive this disinterested protest, which has no other end in view but to courteously discuss a question which is at the same time both sporting and industrial, with favour.—Yours truly,

PAUL MEYAN.

Editor "*La France Automobile*."

THE SETTING OF VALVES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With further reference to this very interesting question, and also in answer to one or two letters in your issue of the 1st; in the first place, I do not dispute the accuracy of a spirit level, what I dispute is that one setting is correct for every engine. Looking through your description of the timing device mentioned, and noticing the very interesting fact that the exhaust valve is opened early and closed very late—so late, in fact, that the inlet valve has commenced to open, reminds me of an instructive episode. About two years ago, in a fairly large garage and repair works in Brussels, a single-cylinder engine was being assembled, the timing of which was marked. As a discussion was going on concerning the timing, I was interested and had a good look at it. According to the maker's marks the inlet valve opened 4 mm. down and closed 6 mm. up; the exhaust opened

12 mm. before the dead centre, and closed 1 mm. over. One of the mechanics stated that the exhaust valve should have a longer period, and suggested opening it earlier and closing it later. The manager was appealed to, as the other mechanic thought it best to assume that the manufacturers of the engine knew the best position. It appears that the car had been losing power before it came in (for worn bearings only) and the manager thought the idea of increasing the extension period quite sound, so it was done, and the next day the owner came and tried the car. The result was disastrous: he said (in my hearing) that it was worse than he ever knew it, and they told him they had made a slight alteration in the timing, and would put it back to its original position, which they did, and the car ran quite as well as when it came in, the loss of power being found elsewhere.

I shall be glad to see the diagrams of the various other manufacturers as promised. I much regret that I am unable to bring the two engines mentioned to the gentleman who wished to prove that the fault was elsewhere; they are not my property, as a matter of fact. I saw the whole thing illustrated in this way at a large works (in England), and it was conclusively shown that whereas one engine ran perfectly and gave over its power (electric test), the other one would not give the same reading with the same valve setting. When they altered the valves they were as alike as no matter, and the engines were identical. If your correspondent has had any experience of engine testing practice as applied to internal combustion engines, he will know that the engines are run several days to get them properly adjusted as regards compression, ignition, carburation, &c., before taking a brake test.—Yours truly,

INTERESTED INQUIRER.

MOTORS AND ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see by your journal that you have thought the suggestions contained in my letter to the "Scotsman" worthy of notice, and you

The Coventry-Humber 10-12-h.p. Motor-Cab just introduced by Messrs. Humber, Ltd.

The chassis of the cab is identical with that of the standard 10-12-h.p. car, except for a few alterations made to comply with Scotland Yard regulations. A feature of the vehicle is the special luggage-carrying capacity on the canopy over the driver, which will take up to 3 cwt. of boxes, trunks, &c.

will, no doubt, as all would, be glad to receive further suggestions that might lessen the risks now encountered, not only by pedestrians and equestrians, but by motorists as well.

If the accumulated sweepings were removed, there would still remain a danger from telegraph and telephone posts, and the wires acting as their supports. In some cases such posts, or their supporting wires, encroach yards on the road, and a wire is really more dangerous than a post, being less easily seen and quite as capable of doing mischief. In some parts of the kingdom such wires are being buried, as they ought to have been at first, which prevents them, not only from doing any harm, but makes them safe from storms, and consequent interruption of their usefulness. If, then, it were decreed that all such wires should be buried, our roads would be, not only safer for any traffic, but more sightly. We have someone in this district, who seems to think that our roads should be reserved for local traffic only, complaining, as he does, of tourists visiting the many attractions of our country. That, surely, is not a spirit to cherish in regard to strangers, whom we ought rather to welcome and receive with open arms. A story is told of an old Scottish farmer, who, on being informed that trains were going to be introduced which would run at the rate of twenty miles an hour, asked "What is all the hurry?" I have much sympathy with that old farmer's question; but we have trains now running sixty miles an hour quite safely, and unless motor-cars can be permitted to run fast, their very *raison d'être* is done away with. Our object, then, ought to be to make our roads

safe and sound for the new traffic. If macadam will not do, perhaps the exigencies of our time will produce some other Mac, whose ingenuity will render our roads fit for any kind of traffic. Remembering the pleasure and comfort of driving in Manchester when the wheels of my cab ran so smoothly along the tram lines, I see no reason why some such lines might not be laid for motors, and, if of a good width, they might be used for horse traffic as well. Iron lasts long, is comparatively cheap, and its use in that way would, in a few years, save as much expense in macadam as would pay the cost of laying down such lines. If such an experiment were begun on our main roads and found satisfactory, it might become universally adopted, and, after all, it would only be following the example which towns have set. Some, no doubt, of selfish spirit, whose ruling idea in Local Government is economy, might object to the initial cost of such durable lines, but if such lines, either of iron or of any other durable material, proved good for motor traffic, they might prevent the need for the only alternative, if motors are to run at a decent rate of speed, viz., a separate track.—Yours truly,

JOHN HADDON, M.D.

GRAPHITE IN MOTOR CRANKCASES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being alive to the many theoretical advantages of graphite as a lubricant, I have in the past made many experiments on its use in the crankcase, but always with the same result, i.e., however small may be the quantity used it gradually accumulates behind the rings and spoils their "spring," and the results are bad compression, breakage of rings, uneven wear. But lately I have again used graphite in the crankcases in order to observe its effect on the cylinder deposit, a subject to which I am devoting myself. I have found that with graphite the deposit forms far more rapidly than is the case when oil alone is employed, and an examination immediately reveals to the eye (without a magnifying glass) the presence of a large proportion of shining particles of graphite.

It is obvious that as graphite will not distil or evaporate, it must, just as road dust, be caught by the oil on the walls and piston head as on a fly-paper, the oil continually distilling away, whilst the graphite and dust accumulate, becoming gradually bound into a solid mass by the carbonaceous residue, which is a product of the decomposition of that small proportion of the oil which will not distil.—Yours truly,

A. DUCKHAM.

DRY BATTERIES FOR IGNITION PURPOSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, Mr. L. Bentley, need have no anxiety about adopting dry cells for ignition purposes, always providing he uses large enough cells, and has a double set in his car connected to a two-way switch, so that the last used set can be rested and allowed to recover its voltage. The writer has tried three of the best known makes of dry cells, but the Obach dry cell made up in 6-volt sets have given by far the best results. The first set of Obach cells was put into constant use in October, 1904, and ran a double-cylinder car about 1,200 miles, including a short tour. These I labelled No. 1. The voltage having dropped to four, another set (No. 2) was purchased and put into circuit in May, 1905, and the No. 1 set allowed to recuperate. No. 1 and No. 2 were used alternately until March, 1907. When No. 1 would only run the car about an hour, and then commence misfiring, it was then pensioned off, and is still doing useful duty on the house-bell circuit. I have just tested it, and it shows over four volts. No. 3 was then purchased and put in circuit. The whole secret lies in getting large enough cells, and using each set alternately. A medical friend of mine had one set of Obach cells in every day use in a busy practice for seven months, with no spare set in the car. As nearly as I can estimate my No. 1 set ran my car about 3,000 miles, about half of which would be in London and suburbs; No. 2 set about 2,500 miles. The cost was 13s. per six volt set. I wrote to the makers, Messrs. Siemens Bros. and Co., explaining that I wanted to try the Obach cells on my four-cylinder car, and they suggested that I should have slightly larger cells, so I purchased four single cells, 3½ in. square by 6½ in. overall; they have just arrived, but I cannot say how they will do on a four-cylinder engine. For single and double cylinder cars I cannot imagine anyone being troubled with accumulators. Of course my friends say dry cells are more expensive. I do not think in practice they will be found so, as two sets costing 26s. should run a single-cylinder car about 6,000 miles, or say two years' use, and if after that they are no good, and have to be thrown away, well, how many motorists have accumulators running two years without having to have them repaired? Myself, I would not return to accumulators even if dry cells were twice their present price, and, if Mr. Bentley purchases good dry cells, ignition difficulties will trouble him no longer.—Yours truly,

W. B. NICHOLSON.

SOME NOTES ON RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "Engineers'" letter taking exception to part of my article on radiators, healthy criticism is always good, but I fear I can hardly bring his remarks under that heading. "Engineers'" knowledge of condensers must be very limited and confined to marine practice that has come under his immediate notice. With the general

type of engines used on land the description, except in special cases, is correct. I may mention a rather interesting experience. An engineer who held an appointment some years preceding my own conceived the idea, instead of water cooling, to let the air do this work, by swinging the condenser on two centres, and revolving it at a quick speed. The condensation was right, but the power it took to drive was greater than the steam saved.

I thank "Engineer" for giving me the opportunity of making my article, if possible, more clear than before.—Yours truly,

E. T. HUMPHRIES, Capt.

THE A.A. TRIPTYQUE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Press have kindly given a considerable amount of publicity to the arrangement by which the Automobile Association issues "tripptyques" for the purpose of enabling motor-cars to enter foreign countries on payment of the necessary deposit at the Association's offices in London. Many of the writers, however, appear to imagine that this department is a profit-making concern. I feel sure, therefore, you will allow me to state that such is not the case. The A.A. neither makes nor desires to make any profit on the issue of tripptyques. It simply wishes the provision of these documents to be an additional advantage to members.—Yours truly,

W. J. BOSWORTH, Col.
Chairman Automobile Association.

WHERE GARAGES ARE WANTED ?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of "L. S. M." in your issue of January 23th, "What Towns need Garages," I have been endeavouring to obtain this information for the past two years, both by personal investigation by motor-cycle over at least four counties and also by advertisement. So far, I have failed to find a suitable location or opening. There seems no demand for such outside the large centres.

Here and there one finds a man with one or two cars doing a fair hiring trade in the summer, and this seems about the best thing to cater for, provided expenses are reasonable.—Yours truly,

HECTOR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "L. M. S.," in a recent issue of the *M.C.J.*, re a good district for a garage and repair depot, I can say that for a go ahead man the town of Dorking (2½ miles from London) should prove an excellent position. From constant association with the town I know that a capital hiring-out trade can be done, not to speak of the prospective custom of the hundreds of cars passing through the town, especially at week-ends, en route to Eastbourne and the South Coast generally. Many motorists also make the town their headquarters when touring in the beautiful country abounding in the neighbourhood, and, in addition, there are a very wealthy class of residents in the district. In conclusion, "L. M. S." must be prepared to be rung up at all hours of the night by motorists passing through Dorking, which, however, should be pleasant music to the energetic proprietor.—Yours truly,

W. G. W.

ADJUSTABLE RIMS AND WEAR OF TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Do tyres wear out much quicker with adjustable rims? Last season I had fixed on my new car a well-advertised make of adjustable rims and tyres. My experience has been very unfortunate as regards the wear of these tyres; they do not last long enough to puncture or wear out, they invariably burst after running about half the distance ordinary tyres would. I have five good burst covers in my motor-house at the present time. As the makers generally ignore their customers' complaints, I should like to know from your readers if other users of adjustable rims have had similar experiences. It appears to me the chief point to be remembered in selecting adjustable rims is: Are you tied to one make of tyre? My tyre expenses for the last season are over double per mile any previous season using ordinary Dunlop or Clinchers. It has become so expensive that I am now thinking of scrapping my stock of tyres and changing the wheels back for ordinary covers (this would cost me over £50), but, before doing so, I should like to know what is the experience of others using adjustable rims.—Yours truly,

NELSON.

SEVERAL correspondents have replied to "L. S. M.," who asked as to towns where a garage might be started with likelihood of success. Their letters have been forwarded to our correspondent.

MESSRS. EASTON AND MELVILLE, of 85, Shaftesbury Avenue, W.C., have taken up the sole agency for Mottord and Co., the well-known New York and Chicago motor accessories firm, and are making arrangements to push their productions strongly on this side of the water.

SOME FEATURES OF 1908 ENGINES.*

(Concluded from page 1075.)

Two engines only have neither carburettor nor accessories on the valve side, and one horizontal and one vertical shaft on the other side. The Alpha adopts this arrangement to enable cover plates which are easily removable to be fixed over the valve stems. An arrangement with a cross shaft only is a favourite with engines that are economical in accessories. Where a magneto and water pump or a magneto and commutator are sufficient, it makes a very neat job to put them on the ends of the cross shaft. They are in the most accessible position possible, are independent of each other, and leave the engine quite free for fitting large inspection doors and for access to the valve stems. Disadvantages are the extra length of engine and the use of skew gear, which cannot be regarded as quite so durable as spur gear. The Thornycroft drives its cross shaft through an intermediate wheel, and thereby gets it high up, and both magneto and water pump in very accessible positions. The commutator and oil pump are at the two ends of a vertical shaft.

By far the commonest arrangement is that with two auxiliary shafts—one on each side, the magneto being on one and the water pump on the other. Forty-four engines are of this type, nearly all of them with a vertical or inclined shaft driven by skew gear off one or the other cam shaft, for the commutator or oil pump, or both. Out of 134 engines of which I have taken particulars, twelve have four shafts and twenty-four three shafts solely for accessories, and this is not counting fans or mechanical drives to lubricators on the dashboard. It is particularly noticeable that the use of many shafts does not lead to the engine or the parts being more accessible, and some of the arrangements must be very costly in construction. The arrangement of the accessories seems to be a point in which a little more standardisation would be of benefit.

There is one point in connection with magnetos which is worth mentioning. I saw a magneto fixed upside down on a Unic engine,

Motoring in Bombay.

From a Caricature Sketch

[Published by the B.riet Company.]

and it looks to be obviously the right position. The business portion of a magneto—the part that wants attention—is in most cases at the bottom. The magneto therefore has to be placed high enough to give access to this, with the result that the magnets hinder access to the valve stems as well as to the moving parts of the magneto. It is not practicable, of course, to take a magneto constructed for standing on its bottom and stand it on its head, but I suggest that if it were constructed for standing on its head, the magnets would be well down in the frame, and out of the way of everything.

Water circulation is another feature in which practice varies very much. Thirteen per cent. only of the makers adopt thermo-siphon cooling. Twenty-seven per cent. of the engines have their water inlet into the exhaust valve chamber. Fifteen per cent. have it into the water-jacket below the valve chamber. Nineteen per cent. have it on the opposite side to the exhaust valve. One has always supposed that the exhaust valve required especially careful cooling, and that the nearer the inlet was to the valve seat the better. A lower place for the inlet has, however, the advantage that if the water pump fails there is a better chance of getting sufficient circulation by thermo-siphon action. Where the inlet and outlet are both on the top of the cylinder or valve chamber, there is no chance of this, but this again has the advantage that a leak in the circuit will not run the engine dry and lead to damage before it is found out. Fourteen per cent. of the cars adopt this arrangement. All the blocks of four cylinders with a pump have one inlet in front and the exit at the top.

* Abstract of paper read before the members of the Royal A.C. on January 23rd, 1908.

The inlet and exhaust piping shows some interesting features, especially in the six-cylinder engines. Of these the great majority have a single straight exhaust pipe with end connection to the silencer, and in the Delaunay-Belleville with connection in the middle. I noticed only six of these (but there are probably some others) which had any expansion joints in the pipe. As the difference in length of the pipe between the two extreme parts when it is hot and cold is about $\frac{1}{8}$ in., I wonder what happens where there is no provision. Nothing can stop the pipe from expanding, and as something must give, the provision for expansion seems to me of considerable importance.

As in a six-cylinder engine two cylinders are exhausting simultaneously, the back pressure is reduced by sub-dividing the pipe. Where, as is not common, the exhaust is alternatively from one of the front three and then from one of the back three cylinders, it is sufficient to divide the pipe into two. Three separate pipes are used by the Britannia, Fafnir, Hillman-Coatalen, Lanchester, Simms, and Thames. One car only, the Scout, indulges in a separate pipe from each cylinder, going directly down to a collecting-box below the frame. The double pipe seems quite enough for the purpose, and does not interfere with accessibility so much as three or six pipes. Turning to the inlet pipes, only one car, the Porthos, has a single straight pipe with the carburettor connected to one end of it. One cannot help thinking that this arrangement must lead to the cylinders getting unequal charges, since, apart from the very different lengths of tubing to the cylinders, while one cylinder is sucking a second cylinder starts work on the same column of gas at different distances off. Many more cars have a straight pipe with connection to the carburettor in the middle. In this, if the suction is alternatively from the front three and back three cylinders, the effect of the two simultaneous suction is always the same, and the difference in the lengths of piping to the different

The Dennis 30-cwt. Demonstration Van.

A van of this type is now located at Birmingham, Leicester, Norwich, Nottingham, Manchester, Bradford and Bristol, where its commercial value can be tested by local firms.

cylinders is not great. The Hispano-Suiza, Humber, and Maudslay, which have their cylinders cast in pairs, and only three inlet ports, employ a pipe with three branches, an arrangement which, when the carburettor is low down, gives a very equal length of piping to the different cylinders. Nearly all the six-cylinder cars with cylinders cast in pairs, and having only three inlet ports, have a double-branched pipe. When there are six inlets the arrangement is difficult unless a straight or a very complex pipe be adopted.

Nearly all the engines have a straight exhaust pipe descending at the end. About 6 per cent. of these use expansion joints. A very few have the descending pipe in the middle. Five engines have two separate pipes, the Arrol-Johnston has three, and six engines have four separate pipes. Of the engines with four cylinders in a block, Aster, Demeester, and Hotchkiss have the exhaust pipe formed in the casting and a single connection to the silencer. Apart from these *en bloc* cylinders, the single straight exhaust pipe, descending at the end, is very simple, and leads to the most accessible engine, and it would be interesting to know how much advantage the more independent methods of exhaust do give, or, in other words, how much reason 15 per cent. of the makers have in departing from the single pipe. In the inlet piping, uniform distribution of the charge is much easier to obtain than with six-cylinders. With cylinders cast in pairs, uniform distribution is attained by each pair having a single central inlet port, the two ports having merely to be joined by a pipe, and the carburettor joined to the middle of this pipe. Practically every engine with cylinders cast in pairs adopts this arrangement. A very few have a straight pipe, with four separate inlets, and I cannot conceive the reason for it. The B.S.A., Itala, and Weigel sacrifice a little in uniform distribution for the sake of the beautifully simple device of bolting the carburettor between the two pairs, one side to the end of each valve chamber. This

does away with all piping. Of thirty-three engines with separate cylinders, twenty adopt the simplest arrangement of a straight pipe connecting the four ports, with the carburettor at the centre, while thirteen arrange the piping for uniform distribution. Ten engines adopt, in different forms, the double-branched pipe, and here again one wants to know whether the simplicity of the single straight pipe does not compensate the gain to be derived from a complex system of piping—one which gives the gas some nasty corners to turn.

Lubrication shows a considerable increase in pumps and mechanical lubricators over last year.

The following table shows statistics of the lubrication of 113 engines; in this "Mech. lubricator" means a device with one or more pumps and sight feeds or regulators, generally on the dash. "Exh. Press." means that the oil is forced to a sight-feed lubricator on the dash by exhaust pressure, and flows to the engine by gravity.

Pump	...	52	89	45 forced feed	{ 24	21 no splash
Mech. Lubr.	...	37	44	68 gravity feed	{ 92 splash	
Exh. Press.	...	24	...			

The forty-five cases of forced feed can be divided as follows:—

Forced into crank chambers only	5
Forced into main bearings only	13
Forced also through shaft to big ends	19
Forced also up connecting-rods to gudgeon pins	3
Forced also through gudgeon pins to cylinder walls	2
Sprayed on to big ends only	1
Sprayed on to big ends and forced to main bearings	2

Only two engines have forced lubrication for every part. The objection to forcing as far as the cylinder walls is that if a really effective pressure is maintained the cylinders get too much oil. Of the three engines which force as far as the gudgeon pins only, one has separate pipes supplying oil to the cylinders by gravity from sight feeds. This seems to me to be the most perfect system of lubrication; a considerable pressure of oil can be maintained, so that if the oil pump is working—and this can be seen by the sight feeds—a stoppage in any pipe is practically impossible. It will be seen that only twenty-one engines carry the forced feed far enough to dispense with splash, and very few fit any convenient means of ascertaining the level of oil in the crank chamber.

ARMY MOTOR RESERVE.

ALTHOUGH the Army Motor Reserve, which evolved from the late Motor Volunteer Corps, was created in July, 1906, its formation was not completed until almost the end of that year. The total number of demands for cars made by the military authorities throughout last year was 123, and included requisitions for various numbers of cars from a single car for an inspection duty to thirty cars for extensive manoeuvres. Very varied descriptions of duties have been performed, such as staff tours, tactical examinations, siege operations, mobilization of land defences, reconnaissance schemes, &c., and in carrying out these duties a total of 343 officers, with their cars, were employed, and performed between them an aggregate of 1,729 days' duty—in which number is included 237 days occupied by officers in making outward and homeward journeys to and from the scene of their actual military work. During September, which is the month usually devoted to the extensive manoeuvres which close the training of the land forces each year, no less than sixty-five officers were employed, and an aggregate of 437 days' duty was performed in that month alone. The distance covered by the cars was 122,505 miles, being an average distance per diem for each car of 70.82 miles, and for each officer for the year 887.71 miles. From statistics which have been compiled, it is found that, exclusive of the contingent allowance for office purposes, the actual cost of the corps to the public for the entire year was £3,947 14s. 3d.; this amount, however, includes £798 15s. in respect of nightly detention allowances. Omitting the latter allowance, the actual cost for each car for a day's duty works out at £1 16s. 4d.—or a trifle over 6d. a mile.

THE KENLEY MOTOR FATALITY.

DUNCAN BROWN, a chauffeur, of Hayes Court, Kenley, was again brought up at the Croydon County Police-court on the 29th ult., on the charge of the manslaughter of Edward Borer, under circumstances already reported in our columns. Mr. Frayling, outlining the case for the prosecution, contended that the evidence clearly proved that the car, driven by the defendant, No. LN 2,011, and owned by Mr. Stewart, of Hayes Court, was the car which knocked down Borer. The defendant's employer said that Brown was to have called for him at 11.30 p.m. with the car, but he did not turn up. The witness saw him in the garage about a quarter past twelve, and was told that the car had been damaged through running into a chain. The car was not washed but was very dusty. There was no blood upon it. Brown was perfectly sober, and the witness had never known him to be the worse for liquor. He was an exceptionally careful driver. After other evidence similar to that at the inquest the case was adjourned until Wednesday, when Brown was committed for trial.

THE CALMON ASBESTOS AND RUBBER COMPANY, LTD., of 1, 2, and 3, Trinity Place, Tower Hill, E.C., have reduced the prices of their motor tyres and still guarantee them for 3,500 miles.

CLUBS AND ASSOCIATIONS.

THE AFFILIATION QUESTION.

NEARLY fifty clubs have now made known their decisions with regard to future policy. Twenty-one, with a membership of 2,482, are remaining affiliated to the R. A. C. and the M. U. for the present year; twelve, with a membership of 3,113, are associating with the R. A. C., and fourteen, with a membership of 1,580, are affiliating with the M. U. The Scottish, Irish, and Ladies' clubs will continue with the Club; the Commercial Motor Users' Association has thrown in its lot with the Union.

ROYAL A.C.

THE Royal A.C. has issued a statement controverting the assertion that the club is dominated by trade influences. No members of the industry are on the competitions and technical committee. The Club's motor houses cost from £500 to £1,000 a year, this being drawn from the funds of the organisation.

THE MOTOR UNION.

THE monthly meeting of the Motor Union of Great Britain and

The Motor Union has agreed upon signs for issue to approved hotels and repairers, and in the task of approving of the establishments the aid of the affiliated clubs and individual members has been secured.

MOTOR CYCLING.

THE annual general meeting of the Motor Cycling Club was held at the Tudor Hotel, London, W., on the 27th ult. Mr. S. J. Sewell was in the chair. Mr. S. H. Fry, on the subject of the London to Edinburgh run, pointed out the great advantages cars had over motor-bicycles in the Schulte Cup Competition, and offered a donation of £5 towards a cup for motor-cycles only in this run. Messrs. C. J. Seed and E. Gwynne immediately promised donations of £5 each, so that in the next Edinburgh and back run the motor-cycles will have a cup, value £15, for competition. The balance-sheet was then adopted *nem. con.*

Mr. Chas. Jarrott was elected president of the club. Vice-presidents:—Messrs. Victor Abraham, Albert Brown, S. F. Edge, J. Van Hooydonk, J. A. Jackson, E. Perman, and S. J. Sewell. Captain: Mr. C. L. Marshall. Hon. secretary: Mr. A. Candler, 1, Lime Grove, Shepherd's Bush, W. Hon. treasurer: Mr. R. C. Davis. Trials hon.

The Clergy and the Motor-Car.—Bishop Prince Skibensky entering Princess Coloredo Mansfeld's 40-h.p. Fiat at Prague, Bohemia. (*Allgemeine Automobil Zeitung.*)

Ireland was held on the 29th ult. at St. Ermin's Hotel, London, when Mr. Joynson-Hicks was elected chairman. The Duke of Newcastle, the Duke of Rutland, and Mr. J. F. L. Brunner, M.P., were elected additional vice-presidents. Twenty-seven new life members were elected, including Lord Iveagh, Sir M. Bromley-Wilson, Bart., Lord Elphinstone, Lady Wakeman, Mr. J. F. L. Brunner, M.P., Mr. G. Deas, J.P., and Mr. J. M. Barbour (Belfast).

It was reported that the renewal of subscriptions to date showed an increase of 30½ per cent. over the renewals for the same period last year.

Among the representatives of individual members on the general committee of the Motor Union just elected are the Rev. H. Harris, the Rev. F. W. Hassard-Short, the Rev. G. T. Ward, the Hon. Lionel Holland, Capt. Owen, Messrs. R. W. Brewer, C. H. Dodd, H. A. Humphrey, G. T. Langridge, J. Kennedy, J.P., G. M. Kenyon, R. A. McCall, K.C., A. E. Newton, A. E. Scarth, and A. M. White.

A county association is to be formed for Nottinghamshire.

Provisional arrangements have been made with a number of engineers to act for the Union on agreed terms.

Including the twenty-seven life members elected at the January committee meeting, there are now 149 life members. Individual members who had up till January 29th renewed their subscriptions totalled 2,752, the figures for the corresponding day last year being 2,089, an increase of nearly 700.

secretary: Mr. C. L. Marshall. Committee: Messrs. Victor Abraham, L. A. Baddeley, S. G. Frost, S. H. Fry, E. Gwynne, R. H. Head, J. Van Hooydonk, F. J. Jenkins, C. J. Seed, H. G. R. Slingo, W. H. Wells, and Dr. Clifford Gibbons. Hon. solicitors: Messrs. J. B. and F. Purchase. Hon. auditor: Mr. S. H. Pearce.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

THE first volume of the proceedings of the Incorporated Institution of Automobile Engineers comes to hand from the office at 1, Albemarle Street, W. This contains the papers read and the discussions arising thereon during the session 1906-1907, a list of members and the memorandum and articles of association. The papers attracted much attention at the time they were read, and their republication in this excellent form indicates the evident intention of the Institution to prove of real value to the technical side of the automobile movement.

At the meeting of the Incorporated Institute, held on Tuesday, Dr. H. S. Hele-Shaw delivered an instructive lecture on the subject of "How to Draw Teeth of Wheels," and gave a demonstration with his own apparatus, which he had first brought before the British Association in 1898. The apparatus itself was very simple, merely consisting of a board above and below which worked two pairs

of small rollers. The advantage of the method was that it made the problem of wheel teeth very easy to understand, and in proof of this the lecturer, by means of a piece of apparatus of this kind, drew a number of teeth of various sizes, from which the audience could see without any difficulty the actual operation of teeth in various forms in conjunction with each other, and the reasons why the form of some teeth was good and others bad.

The adjourned discussion on the papers on "Front-Driving," by Dr. H. S. Hale-Shaw, Mr. P. W. Harvey Bailey, and Mr. J. S. Critchley, will be resumed on Wednesday, February 12th, at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., when the chair will be taken by Col. R. E. Crompton, C.B.

CYCLE AND MOTOR TRADES BENEVOLENT FUND.

MR. E. A. WILSON presided at the annual meeting of the Cycle Trade Benevolent Fund, held at the Holborn Restaurant, London, on the 29th ult., when the balance-sheet that was presented showed an excess of assets over the liabilities of £3,698. This had been increased so that at the present time the amount exceeded £8,000, including £2,000 received from the Society of Motor Manufacturers and Traders. It was announced that the Society of Motor Manufacturers had nominated Messrs. S. F. Edge, F. Lanchester, E. Lisle, Harry Smith, and W. G. Williams as their representatives.

The first meeting of the new council took place at the conclusion of the annual general meeting, Mr. Harry Smith being voted to the chair. Directions were given to the trustees to invest a further £3,000 in certain stocks, and Mr. A. J. Wilson, 154, Clerkenwell Road, London, E.C., was elected hon. secretary, with Miss E. M. Sayer as hon. assistant secretary. The following were elected to form the Executive Committee: Messrs. F. B. Bale, Albert Brown, G. Cooch, S. F. Edge, Geo. Holland, E. F. Johnson, E. A. Lamb, F. Lanchester, E. M. Mayes, F. W. Shorland, W. A. Staudring, and W. G. Williams.

The Manchester motor trade is invited by the committee of the local centre of the Cycle and Motor Trades Benevolent Fund to give their support to a concert to be held at the Midland Hotel, Manchester, on Tuesday next, when Mr. Albert Brown will preside, and Mr. Harry Tate, who is a motorist as well as an artiste, will be present.

AERO.

ARRANGEMENTS have been made by the Aero Club for holding future aeronautical contests at Hurlingham, where private ascents may be made any day between 6 a.m. and 6 p.m.

A challenge has been sent on behalf of the club to compete in the Gordon Bennett Aeronautical Race in Berlin, in October, 1908.

Additional premises have been taken at 188, Piccadilly, London, W., and next month a room will be set apart for the use of members.

MOTOR YACHT.

At the invitation of the Motor Yacht Club, an International Conference of clubs and organisations interested in motor-boat racing was held on Wednesday of last week, at the Royal A.C., when delegates from the following clubs were present:—The Royal Belgian Yacht Club, the Motor Yacht Club of Belgium, the International Sporting Club of Monaco, the Automobile Club of France, the Société de la Voile et de l'Automobile d'Arcachon, the German Motor Yacht Association, the Marine Motor Association, the Motor Yacht Club, the British Motor-Boat Club, the Scottish Marine Motor Club, the Motor Yacht Club of Ireland, the Sussex Motor-Boat Club, the Royal Netherlands Yacht Club, the Royal Italian Yacht Club, and the Dutch Motor-Boat Club. Lord Montagu of Beaulieu was voted to the chair, and welcomed the delegates on behalf of the British clubs.

Mr. F. P. Armstrong, on behalf of the Motor Yacht Club, moved the following resolution:—"That it is advisable, in the interests of the sport of motor-boat racing, and particularly with a view of facilitating the holding of international contests, that international measurement and racing rules be formulated, as has been done in the case of the kindred sport of yacht racing." After discussion the resolution was carried.

Professor Busley, of the German Motor Yacht Association, moved:—"That it is advisable that an international association be formed on a national representative basis, for the purpose of drawing up and administering such international rules." This was carried.

Mr. F. P. Armstrong then moved and Count Recoape seconded:—"That all properly constituted clubs and organisations which take an active part in the encouragement of marine motoring be asked to consider resolutions 1 and 2 adopted by this meeting, and to signify within a period of three months their intention of giving their support to the proposed international association, and that a further meeting be held early in May next, to receive such replies, and, if deemed advisable, to proceed with the formation of the International Association."

On the suggestion of the French delegates the preliminary work in connection with the formation of the International Association was left in the hands of the Motor Yacht Club.

NORTH LONDON.

At a recent meeting it was decided to change the title to "North Middlesex," and in view of the extended sphere of influence the number of the committee has been raised to eighteen.

An invitation has been received from the Hon. Rupert Guinness to

a garden party at Pyreford Court, Woking, in June, while Capt. Cecil Banbury has offered to present another cup. This, together with the trophies to be put up by the North Middlesex Club, should be the means of increasing the membership.

The secretary, Mr. Barber, had the misfortune to fracture his wrist while starting a car, so the kindly forbearance of correspondents, should they not receive early replies to their communications, will be esteemed.

CAMBRIDGESHIRE AND ISLE OF ELY.

THE annual general meeting was held at the University Arms Hotel Cambridge, Mr. G. D. Newton in the chair. Two new members were elected, bringing the membership up to sixty-three. The balance at the bank is £49 17s. 3d.

The following officers were elected:—President, Col. Duncombe, Wareley Park, Sandy; vice-presidents, Viscount Clifden, Wimpole Hall (Lord Lieutenant), Mr. C. D. Rose, M.P., Newmarket; committee, Messrs. G. D. C. Newton (chairman), H. E. Hughes, F. R. Harding Newman, S. G. Howard, S. W. Graystone, H. W. Lewin, W. W. Wingate, M.D., F. L. Nicholls, A. Hall, C. Dunn-Gardner, M. V. J. Wedder, G. S. Wilkinson; hon. treasurer, Mr. G. R. C. Foster; hon. secretary, Mr. E. F. Bindloss; representatives on Motor Union General Committee, Messrs. G. D. C. Newton and E. F. Bindloss.

HERTFORDSHIRE.

At an extraordinary general meeting of the Hertfordshire County Automobile Club, which was held immediately following the annual general meeting at the Euston Hotel on Friday of last week, it was decided that the club remain affiliated to the Royal A.C. and the M.U. during 1908.

At a subsequent meeting of the 1908 committee, Mr. S. Saker was elected chairman, Mr. S. J. Ellis was elected hon. secretary, and Mr. Arthur J. Salmon was re-elected hon. press secretary.

SOUTHEND AND DISTRICT.

THE annual general meeting of the Southend and District Club was held at the Hotel Victoria, Southend-on-Sea, on Wednesday of last week, Mr. J. B. Carruthers being in the chair. About thirty members attended or were represented. The committee's report and accounts were read and approved. The club had at the 31st December last, after its first year of working, seventy members, divided into one-half car members and one-half motor-cyclists.

The club has decided to support the Motor Union solely and has cancelled its former affiliation to the Auto-Cycle Union. The meeting decided to increase the annual subscriptions to £1 ls. per annum for car members, and 15s. per annum for motor-cyclists. The rules were considerably added to and altered and the meeting terminated after a hearty vote of thanks had been passed to the chairman.

SOUTH WALES AND MONMOUTHSHIRE.

THE annual dinner of the South Wales and Monmouthshire A.C. will be held on the 15th inst. and will be an important social event for Cardiff. The business affairs of the club have just been considered at the annual meeting, when Mr. H. M. Gregory presided. The statement of accounts showed that the income had exceeded the expenditure by £98, and that the debt on the motor house, which cost more than £300, had been cleared off. Recognition was given to the consideration shown to motorists by the police magistrates of Cardiff and Glamorgan, and it was decided to continue association both with the R.A.C. and the M.U.

Mr. J. Thompson Willows and the Rev. M. Whiteside were re-elected hon. secretary and hon. treasurer respectively, and the following new members were elected on the committee:—Messrs. E. England, W. Eastabrook, F. Shearman, T. Butt Ekins, W. H. Brain, and Ralph E. Morel. Mr. B. H. Trinpe and Mr. J. M'Faggart were appointed hon. auditors. Captain D. Hughes-Morgan, Dr. Tenison Collins, and Mr. J. Thompson-Willows were appointed representatives to the Motor Union, and Mr. F. C. Shackel, Church Street, Cardiff, was appointed hon. solicitor.

SCOTTISH.

THE Committee of the Scottish A.C. have entered into an arrangement with the Car and General Insurance Corporation, Ltd., under which that corporation will allow a rebate of 10 per cent. (with a maximum rebate of £2 2s.), from all premiums for comprehensive policies of not less than £6, effected with them by members of the club. That corporation will in such cases issue a special "S.A.C." policy, including a clause providing that any matter of dispute arising thereunder be referred to the arbitration of the executive committee of the club or of any arbitrators to be named by them.

The membership of the club now exceeds 1,000.

SCOTTISH MOTOR TRADE ASSOCIATION.

At the annual dinner of the Scottish Motor Trade Association, Mr. Thomas Shaw presided, being supported by several well-known English motorists as well as by all the representative traders north of the Tweed. The funds now amount to £278 from annual subscriptions, and Mr. Shaw was able to point to a membership of more than two

and a half times what it was a year ago. Mr. J. H. Paterson, of Aberdeen, proposed "Our Guests," and Mr. Frederic Coleman, of White steam car fame, responded. Other speakers included Messrs. W. L. Sleigh and J. S. Napier.

THE Midland A.C. held a ladies' night at the Grand Hotel, Birmingham, on Saturday.

MR. T. F. TURNER, 389, South Road, Walkley, Sheffield, is the secretary of the Sheffield and Hallamshire M.C.C.

MR. M. J. CHAMBERS, 15, Edenvale Road, Ranelagh, Co. Dublin, is the secretary of the newly-formed Dublin and District M.C.C.

MR. W. J. BROOKE, 2, Cliff Gardens, Frodingham, Doncaster, is interesting himself in the formation of a centre of the Lincolnshire M.C.C. for Scunthorpe, Frodingham, Kirton-Lindsey and Brigg.

THE annual dinner of the Blackheath A.C. was held at the Art Club, Blackheath, on Friday of last week, Col. H. C. L. Holden, R.A., F.R.S., in the chair. About fifty members and friends were present, and after dinner enjoyed an excellent musical programme arranged by Mr. F. G. Nichols, a member of the club.

THE LIABILITY OF REPAIRERS.

A CLAIM arising out of a motor-car accident near Arundel has come before Judge Gye and a jury at the Portsmouth County Court. It was brought by Messrs. Vosper and Co., of Portsmouth, against Mr. G. de Castro, of London, the amount in dispute being £23 10s. Mr. Harvey, in opening the case, said that on September 13th and 14th Mr. de Castro's motor-car was in a disabled condition at Horsham, and the owner sent a communication to the plaintiff for a man to tow the disabled vehicle to his works. The plaintiff's foreman Caley was sent next day in another car, but he found that the damaged vehicle was in such a bad state that it could not be towed to Portsmouth, and accordingly Caley took certain parts of it to Portsmouth to put them sufficiently right to enable him to drive the car to the works. On the 18th Caley, accompanied by an electrical engineer, left Portsmouth by train for Horsham, and put the car in order to drive home, and they proceeded from Horsham, driving slowly. When they were coming down a hill on the way to Portsmouth, at the junction of another road, they came into collision with a car owned by Mr. Parsons, and the result of the collision was that the repairs now being sued for were necessitated. Counsel alleged that the driver of Mr. Parsons' car was in the wrong, and read correspondence which, he declared, established the fact that the motor-car was repaired by Mr. Vosper in respect of the smash with the full consent and agreement both of the insurance company, which was really the defendant in the action, and of Mr. de Castro, and as far as the repair work was concerned that the work was admittedly satisfactory. Counsel's view of the law was that where a car was delivered into the hands of any person to be repaired, the repairer from the moment he took it to the time it was returned was under the obligation to take as much care of it as he would of his own property, and in the event of anything happening then the owner must be responsible, with the power to recover from any negligent person who may have caused damage. The question in this case was whether the £23 10s. should be paid by Mr. Vosper, by Mr. de Castro or the insurance company. If, as a fact, they found that while the car was in Mr. Vosper's possession it met with the damage by Mr. Vosper's servants not taking ordinary care of it, Mr. Vosper must pay. If, on the other hand, they found that the damage was in no way due to want of care on Mr. Vosper's part, but from the negligent act of some third person, then the plaintiff must not be made to pay it.

No witnesses were called for the defence, and Mr. Harvey having addressed the jury, Mr. Shakespeare submitted his arguments for the defence. He contended that the correspondence clearly showed that the order was given to do the work of repair on the understanding that it should be settled afterwards who was responsible. The car was not damaged under any conditions over which Mr. de Castro could have any control, while before the repairs were commenced the plaintiff was informed by letter from the insurance company that he would be held responsible for the repairs, but he, apparently, had a good claim against Mr. Parsons.

The Judge, in summing up, pointed out that there was no denial of liability by the defendant in his evidence, and also laid stress upon the fact that no evidence had been called, or suggestion made, of any negligence on the part of the plaintiff's men. The jury found a verdict for the plaintiff, and judgment for the amount claimed, with costs, was entered accordingly.

JUDGE DODD, of Belfast, has just bought a 20-h.p. Beeston-Humber landaulet through the Belfast agents of the company, the Ulster Motor Works.

FROM Messrs. Geipel and Lange, Vulcan Works, St. Thomas's Street, London, S.E., we have received samples of their Okonite motor-car ignition cable both for high and low tension circuits. The original cost of these cables may be somewhat higher than the ordinary vulcanised rubber, but it is claimed that they will be found the cheapest in the end. The advantages claimed for the cables are that they do not deteriorate on exposure; the toughness resists abrasion by foreign substances; they are not susceptible to changes of temperature, and resist chemical action; easy and reliable joints can be made without vulcanization; and finally they have an extremely high insulation resistance.

CASES UNDER THE MOTOR CAR ACT.

A DISMISSAL AT KINGSTON.

At Kingston, on the 31st ult., James Wickins, of Finborough Road, S.W., was summoned for exceeding the twenty-mile speed limit at Walton-on-Thames. The Bench thought that there was a doubt in the case, and dismissed the summons. Seven other motoring defendants were, however, fined £5 each.

ROAD REPORTS.

LINCOLNSHIRE.—The Roads and Bridges Committee of the Holland County Council have decided to try an experiment on a mile of the Spilsby Road, with a view to solving the dust problem. The road is the principal residential one leading into Boston, and the dust caused by the motor-car traffic has been a source of annoyance to the residents.

SAWBRIDGEWORTH.—At a meeting of the Herts County Council, Mr. E. B. Barnard, M.P., directed attention to the state of the road near Sawbridgeworth Station, which, he said, was becoming dangerous. Mr. Stride, chairman of the Highways Committee, promised that an attempt should be made to remedy the evil.

WARWICKSHIRE.—The County Surveyor for Warwickshire has drawn attention to the bad condition of the Birmingham and Coventry and Coventry and Birmingham main roads. In order to bring those portions which lie in Warwickshire to a standard sufficiently good to carry the new motor traffic he has had to strengthen the foundation and put on

Sightseeing by Motor-Vehicle.—One of Messrs. T. Cook and Sons' Motor Char-a-bancs at Versailles.

a thicker coating of granite. The extra material for this purpose cannot be provided out of the current year's allowance, and a special committee has been appointed to view the road and make suggestions with regard to the financial aspect.

CAMBRIDGE.—In the Histon district of the county repairing patching will be proceeding on most of the roads until the end of next month.

AUTOMOBILE ACCIDENTS.

A SERIOUS mishap between a motor-car and a cab took place outside Edinburgh the other night. At the Craigleith Station end of Barton Terrace a motor-car, occupied by the chauffeur and two passengers, dashed into a cab which was driving in front. A wheel of the cab was knocked off, and some of the woodwork was splintered, while the passengers sustained severe shocks.

A MOTOR-CAR belonging to Sir Arthur Vivian, of Bosahan, St. Anthony, when returning from Helston on Friday morning, ran back over one of the Rosevears Hills and turned turtle at the bottom, pinning the driver underneath. Help was fortunately forthcoming from Mr. Cooke's blacksmith employees. The car was set right and was but little damaged. The driver was not severely injured.

FROM the H. H. Franklin Manufacturing Company, Ltd., of Syracuse, U.S.A., we have received a copy of the very artistic catalogue they have lately issued; it gives full particulars of the various types of Franklin cars—16-h.p., 28-h.p. four-cylinder, and 42-h.p. six-cylinder, all fitted with air-cooled engines, while the illustrations of the cars and the main component parts are a notable feature, being of an unusually clear character.

FORTHCOMING EVENTS.

FEBRUARY.

7th (F.).—N.W. London M.C.C. annual general meeting.
 7th-15th.—Motor Show, Manchester.
 13th (Th.).—R.A.C., Mr. Wyatt on Magnets.
 15th (St.).—Auto-Cycle Union annual dinner at the Hotel Cecil, London.
 19th (W.).—Annual dinner of the Cardiff M.C.
 20th (Th.).—Meeting of the Essex M.C.
 21st (F.)-29th (Sat.).—Manchester Motor-Car Show at Belle Vue.
 24th (M.).—Motor Show opens at Bcmabay.
 27th (Th.).—Mr. Mervyn O'Gorman at the R.A.C. on "Gear Transmission."

MARCH.

5th (Th.).—Paper by Dr. W. Watson at the R.A.C.
 11th (W.).—Annual meeting of the Incorporated Institution of Automobile Engineers.
 11th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 21st (Saturday)-28th (S.).—Cordingley's Thirteenth International Motor-Car Exhibition will be held at the Royal Agricultural Hall, London.

APRIL.

18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.

MAY.

10th (Sun.).—Targa Florio Race.
 11 (M.)-16 (S.).—Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

11th (Th.).—Probable start of the International Touring Car Trial of the R.A.C.
 15th-19th.—Scottish Reliability Trial.

LIGHTING-UP TIMES—LONDON.

COMPANY NEWS.

MERCEDES ELECTRIC MANUFACTURING COMPANY.—£50,000. Manufacturers of motors, cycles, and vehicles. Agreement with Mercedes Mixte, Ltd. No initial public issue. 11A, Regent Street, S.W.

FOUNTAIN'S COACH AND MOTOR COMPANY.—£3,000. To acquire business of coach and motor builders, &c., carried on at 25, The Grove, Ealing, as H. L. Fountain and Son.

H. TALBOT BELL, LTD., 38, East Street, Farnham, Surrey.—Capital £2,000. Under agreement with S. A. Marples and H. Talbot Bell to carry on business of storers and manufacturers of motors, cycles, &c.

OLDHAM MOTOR COMPANY, LTD.—Capital, £5,000. To carry on the business of manufacturers of, agents for, dealers in and letters-to-hire of motor-cars, &c. 36, Manchester Road, Oldham.

THE Arno Motor Company has been registered with a capital of £2,000.

PNEUMATIC SYNDICATE.—£7,500. Agreement with Pflaumatische Gesellschaft mit beschränkter Haftung and Seymour and Gordon, Limited, manufacturers of tyres, Grosvenor Mansions, 82, Victoria Street, Westminster.

LIMITED PARTNERSHIP.

J. G. MOODY AND COMPANY.—Motor cycle engineers, Harpenden. Partnership for five years from January 1st, 1908. General partner: J. C. Moody, Harpenden. Limited partner: C. T. Part, The Hyde, Harpenden, contributing £750 cash.

PUBLIC MOTOR SERVICE.

SWANSEA.—With reference to the proposed motor services from Swansea to Mumbles, Mr. Monger, solicitor, who is one of the chief movers in the matter, says that it is proposed to put on a service of six cars, which will commence to run about Easter next. The arrangement is that certain gentlemen will guarantee to use them for the twelve months, and if the project pays the service will be handed over to a local syndicate at a certain figure. It is also proposed to have cars available for parties to Bishopston and Parkmill.

A NEW petrol filter specially designed for motor-cycles has just been introduced by the E. M. Bowden's Patents Syndicate, Ltd. Assembled, it is but 2½ in. long by 1½ in. diameter, and it weighs only 8 oz. It is attached between the tank and the carburettor, the petrol flowing upwards through the straining gauzes, effectually intercepting any solid matter that may pass from the tank.

BUSINESS NEWS.

THE COVENTRY MOTOR WHEEL CO. have removed to larger works in Spon Street, Coventry.

MESSRS. ROBERT CALLOW AND SONS, Westland Row, Dublin, have taken up the agency for "Standard" cars in Leinster.

MESSRS. W. T. FLATHER, LTD., the makers of the "Ubas" steel, have opened a warehouse at 15, Osnaburgh Street, Euston Road, N.W., and offices at 14, Mortimer Street, W.

THE METALLIC MOTOR CAR WHEEL COMPANY, of Milford Road, Nottingham, has sent us a circular illustrating the "Crawden" detachable rim and the "Hiley" detachable wheel they are introducing for use on motor-cars.

By arrangement with the Acetylene Illuminating Company, Ltd., of 268, South Lambeth Road, S.W., the Dissolved Acetylene Company has ceased to trade in dissolved or compressed acetylene gas and motor-car lighting outfits, cylinders and apparatus used in connection therewith.

MESSRS. DENNIS BROS., LTD., Guildford, have sent us a copy of the 1908 catalogue of Dennis cars they have just issued. This is a very complete production, the full detailed descriptions of the various models—20-h.p., 28-h.p., 35-h.p.—being supplemented by half-tone illustrations of the different types, and also line drawings of the main components, notably the worm drive, which is one of the special features of the Dennis cars.

FROM MESSRS. DEAN SMITH AND GRACE, LTD., of Keighley, comes a copy of their catalogue showing the latest types of lathes made by the firm. These have been designed for taking advantage of the largely increased working capacity of the various high-speed steels, and have been supplied to many of the leading automobile engineers in France as well as in this country. The firm specialise in this class of machine tools.

FROM the Swift Motor Co., Ltd., Coventry, we have received a copy of their latest catalogue, which gives full particulars of the various models of Swift cars—10-12-h.p. two-cylinder, 18-24-h.p. and 25-30-h.p. four-cylinder. In addition to illustrations of the complete vehicles the main components are also clearly depicted by half-tone blocks, while the several pages devoted to testimonials bear evidence of the popularity of the Swift cars.

THE 1908 catalogue of the E. M. Bowden's Patent Syndicate, Ltd., comes to hand in the most complete form. All those interested in the Bowden patent wire mechanism will find the illustrations and explanations of their various adaptations of particular value as well as of interest. The specialities are too numerous to enumerate, but attention may well be drawn to the Bowden patent strainer, which has been improved with a view to insuring that it is absolutely petrol-tight. It is now made entirely at the firm's works.

POLICE TRAPS.

A POLICE trap is in frequent operation on the Coventry road at Exhall.

THE Portsmouth road, Walton, and the Portsmouth road, Esher, are both the scenes of police traps, which are being energetically worked.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-28, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, FEBRUARY 15, 1908.

[No. 467.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

NOT only are cars changing in power and form from the earlier designs, but preconceived notions with regard to their care and keep are also veering round to a more settled view. At one time, for instance, little regard was paid to the housing of automobiles, and even in such a work as the Badminton volume on motoring we find an expression as to the ventilation of a motor-car house being almost unnecessary owing to the constant opening and shutting of the large doors. This idea was dispelled on Friday of last week by Mr. Harrison Townsend in the excellent paper he read before the members of the Architectural Association. The ventilation of the garage is not only now recognised as an important factor in its safety, but it is one of the problems that present some difficulty to the architect. The gas resulting from the evaporation of petrol is heavier than the air, and its escape is a matter all the more difficult as no principle based on upright extraction shafts can be of any avail. Mr. Townsend has evidently considered the subject in all its aspects, and his paper, summarised on another page, will be helpful to those who intend to own, as well as to those who have to design, a motor garage.

The Conference.

ON Monday, with a view to a full understanding of the present situation, a committee of the Royal Automobile Club received a number of representatives of provincial automobile clubs at the club-house in Piccadilly. A meeting of the Executive Committee of the Motor Union was held on the same day, Mr. W. Joynson-Hicks presiding. The committee also received the deputation from provincial clubs, desiring consideration of the possibility of a new agreement being entered into between the R.A.C. and the Motor Union. The deputation was composed of Messrs. J. E. Hodgkin (North Eastern A.C.), T. W. Grace (Manchester A.C.), R. W. Buttemer (West Surrey A.C.), H. A. Watson (North Yorkshire A.C.), A. Armitage (Somerset A.C.), and S. F. Harris (Northamptonshire A.C.). In both cases the proceedings were private, but it is understood that no decision was arrived at.

International Touring Car Trial, 1908.

THE regulations for this Trial have now been approved by the Committee of the Club, and a table of touring-car standards has also been adopted for the purposes of classification. It has been decided that the Trial shall start from a point in or near London at 8 o'clock on the morning of Thursday, June 11th. All competing cars will have to be within the gates of the first depot by noon on Monday, June 8th. A fine will be required in respect of any competing car arriving after that hour and up to 12 midnight. After 12 midnight no

car will be admitted. The cars will proceed to Glasgow by a short route; from Glasgow they will follow the routes of the Scottish Trial and be under the management of the Scottish A.C. until the end of the Scottish Trial; thereafter they will finish on the Brooklands track. The Club will award a cup to the winner of each class, and a certificate will be given in respect of the performance of every car, whether it completes the Trial or not, and the Club reserves the right to publish any certificate. The entry fees are:—Class 1, £51; Class 2, £52; Class 3, £53; Class 4, £54; Class 5, £55; Class 6, £56; Class 7, £57; Class 8, £58; Class 9, £59; Class 10, £60. A car may be entered by its manufacturer or by his authorised agent or nominee, but, where two similar cars of one make have been entered, entries by the manufacturer, his authorised agent, or nominee, shall have priority should elimination be necessary. Cars will be considered similar unless their R.A.C. horse-power rating varies by at least 15 per cent. In determining such variation 15 per cent. shall be deducted from the larger.

Mr. Jarrott on Racing.

THOSE who were fortunate enough to hear Mr. Charles Jarrott give his reminiscences of the early days of motoring to the members of the Coventry Engineering Society, on Friday of last week, had a most interesting evening. Mr. E. M. C. Instone was in the chair, and Mr. Jarrott, fresh from his record breaking at Brooklands, dealt with the perils as well as the pleasures of those early days. The earnestness with which he pleaded for the motor-cycle recalled his early exploits with "great" machines of 1½-h.p. He has always been an advocate of the smaller form of the automobile, and even now, when cars of large power seem a commonplace in the streets of London, it is interesting to hear Mr. Jarrott suggesting that makers should still strive to catch the favour of the great majority of people by producing a motor-cycling machine simple in construction, easy to control, and reasonable in price. A reference to his racing career led to the remark that in early days motorists raced because they enjoyed the experience, but the commercial conditions which now prevail in the industry had entirely altered the old view of the sport.

The Organisation of Drivers.

THE fact that more than 2,000 certificates of efficiency have been issued by the Royal A.C. in connection with their various examinations has doubtless influenced Mr. C. D. Rose, M.P., in suggesting that something might be done to weld those paid drivers who have obtained certificates into an organisation for their mutual benefit. On his initiative the general committee of the Club have resolved to take action, and an association solely for drivers and mechanics is now being formed. Towards the expenses of the formation the R.A.C. will probably contribute a substantial fund. Doubtless the society will be registered under the Friendly Societies Act, and further details will be awaited with considerable interest. Several attempts have been made towards a similar end, but the difficulties in the way have apparently been almost insurmountable up to the present.

The Outlook.

A PESSIMIST has been writing about the motor trade of Coventry in the "Economic Review"—a quarterly journal which has a reputation for dealing with facts. Not all its contributions are written so modestly as that of Mr. G. B. Carlisle in the current issue, who says that "this article will only touch the fringe of the problem; and if it is inaccurate in any part the writer's want of exact knowledge must be taken as his excuse"—a declaration, the *naivete* of which is delightful. Reference is made to the dulness in the industry, which is ascribed to a great excess of production, which is caused by (1) too many firms being engaged in the trade, and (2) the enlargement of buildings, the plant in which has to be kept going. The bad weather of last year is blamed, for the author regards the motor-car as a luxury and as only a seasonal industry. He hopes better times will come, but is apparently not over-sanguine, for "the abnormal popularity of the motor has begun to wane." Such statements seem to show the need of the author's apology already mentioned, and probably the point in the article that will find most acceptance in the industry is that "the November Show has failed to elicit as large an amount of orders as was confidently expected." Fortunately the trade has another chance—towards the end of next month.

The 15-h.p. Mors Live Axle Car just supplied to Mr. Gerald P. Fitzgerald by Mors (England) Ltd.

The vehicle is fitted with a two-seated body and an extra seat at the back for two other persons, which, when not in use, neatly folds away. There is also a large space at the back fitted with drawers, &c., for tools and spare parts. The car is also fitted with Vinet detachable rims, Victoria leather hood and "Ideal" glass screen, which makes it a perfect touring machine.

Motoring Bishops.

RECOGNISING the many difficulties which the Bishop of Southwell (Dr. Hoskyns) has to contend with when visiting distant portions of his extensive diocese, a committee of Nottinghamshire and Derbyshire Churchmen recently issued an appeal for subscriptions towards the purchase of a motor-car for the Bishop. Nearly £900 has been subscribed, and a car has been purchased which Lord Scarsdale presented to the Bishop at Nottingham on Saturday, along with a small balance in hand towards the erection of a motor-house near the Bishop's palace at Southwell. It is interesting to note that a movement is afoot in the diocese of Winchester to present Dr. Ryle with a motor-car. It would seem that the time is not far distant when every Bishop will have his car—the orthodox gift of generous admirers. On this point we may assure those good bishops who have not yet obtained an automobile that the possession of such a desideratum does not mean they will have more work to do, but that they will be able to perform their offices with greater ease and comfort. We have it on the authority of the motoring Bishop of Lichfield, he does no more work now he has a car, but by its means he is far fresher when he arrives at his des-

ination and keeps his appointments. The weariness that came from railway journeys and waiting in the cold was intensely trying. This he is now freed from.

The Bishop's Motoring Policy.

EVIDENTLY the Bishop of Southwell intends to maintain the reputation of motorists, for he told his friends on Saturday that he felt he was joining a great brotherhood of the road, with all the rules and courtesies which are due from those who rode on the road in motor-cars. He had received a letter from a member of Parliament in which he said some things which it was well he (the Bishop) should remember. The member said he hoped the car would carry Dr. Hoskyns thousands of miles without a smash or accident to himself or anyone else, and that he might get hold of a driver who understood that the lamest old body who crossed the road had as much right to it as the finest motor-car that was ever built. Those were wise words, Dr. Hoskyns added, from one of their statesmen, because he thought a good many of those who had either been in cars or outside cars on the road were realising that those who drove motors were not all loved, and it was quite possible that his day of popularity was over, and that in the future he should be looked upon as rather a nuisance to a good many of those he should meet on the road. He did, however, intend to resist the temptation which they said ladies were constantly urging drivers to fall into—to go at a tremendous pace. We hope the Bishop will be able to live up to his good intentions in this respect.

The Passenger Duty on Railways.

INCIDENTALLY one of the results of the way in which the vehicles on the roads are competing with those on the rails is to bring into new prominence the 5 per cent. passenger duty which is levied on railway companies. At the meeting of the Brighton and South Coast Railway Company a shareholder brought forward a motion against the tax, "having in view the fact that other companies, conveying passengers in competition with them in carriages or vehicles propelled or drawn by motor power, electricity or other mechanical means on public roads, pay no duty." He naturally declared against the alleged preference which motor vehicles obtained, and Lord Cottesloe, the chairman, added that the tax should either be taken off or motor-cars should be made to pay a similar duty. We believe that the meetings of bus companies have been equally as discouraging as those of the railways of late, and doubt whether the anxiety of the railway shareholders for uniformity would find an echo in such circles. But the railway managers should not attempt to solve the problem by making difficulties for other means of locomotion. They must improve their own organisation to meet the changing circumstances of the time.

The Travelling Public.

IN the course of the paper which he read to the members of the Royal A.C. last week on London traffic and railway electrification Mr. Philip Dawson had something to say which should be comforting to the managers of the railways who are now bewailing the loss of revenue through the competition of other forms of traffic. Indirectly, the tramways and motor-omnibuses may be of great benefit to the railway, for undoubtedly they are teaching the public to travel, and that this habit, when once acquired, constantly increases is well known to all those who have devoted any study to traffic problems. Thus, in 1867, the numbers of journeys per head of population in London were twenty-three, whereas now they are over 200, the greatest growth having taken place since 1890, when the journeys per head of population only amounted to ninety per annum. This great increase is small when compared to what has taken place in New York, where in 1860 the population travelled forty-seven times per annum as compared to over 400 times per annum to-day. The great increase in this case has taken place since 1880, when

the population only travelled 180 times per annum. And in this connection it must be borne in mind that not only does the number of times the population is carried per annum increase, but the population itself is constantly and rapidly growing.

The King at Brighton.

OUR Royal motorist the King went to "Dr. Brighton"—as Thackeray loved to describe London-by-the-Sea—on Monday. Of course he went by car, doing the journey in rather less than two and a half hours, thus disproving the assertion of anti-motorists that the Brighton road is simply a motor racecourse. During the days of the Georges this famous highway was the most fashionable of all the coaching roads, the record being three hours twenty minutes by stage coach. Now it is certainly one of the most popular roads among motorists of the south, who have made the numbered car so familiar to the police that the absence of the identification mark on the King's

spondence columns indicates that the methods of the operators have not substantially changed from those which aroused early antipathy. Perhaps it would be well if the Automobile Association, which we notice is now extending its organisation along the main roads of Lancashire and Yorkshire, were to make a special point of circumventing the policy of the southern police, who are apparently expecting to catch motorists napping.

Motor-car Imports and Exports.

COMMENCING with the first issue in 1908 an interesting and useful alteration has been introduced in the monthly import and export returns issued by the Board of Trade. Hitherto the automobile industry has been dealt with under two headings, complete cars and parts thereof, the chassis having been included among the latter. In future, however, separate classification is to be given to chassis, so that the returns will afford a better indication of the nature of the imports and exports than

Sir John Millar—a familiar figure in the automobile world—with a party of guests and four of his Napier Cars, at his Wiltshire home at Heywood.

Sir John purchased his original car in 1903; this was a 12-h.p. four-cylinder, which is still in active use, and may be seen at the extreme right of the photograph. In addition to the 12-h.p. and a 40-45-h.p. four-cylinder, he now owns a 40-h.p. six-cylinder limousine and also a 60-h.p. of the latest type, on which is mounted a most luxurious and up-to-date shooting brake.

car led to an amusing incident on Monday. The King motored to Portslade-on-Sea, where an observant constable, noticing that there was no number-plate on the car, peremptorily called upon the royal party to stop. The occupants of the car meeting this request with a smile, the police officer promptly boarded the vehicle, with the evident intention of vindicating his authority. He was introduced to his Majesty, upon which he politely bowed and dropped from the footboard with the utmost alacrity.

Police Traps Again.

THE police in the Crawley district have been so consistent in their activity against motorists that their recent absence on certain main roads has been regarded as but temporary by those who are acquainted with their ways and methods. The advent of a few fine days has again brought the police trap into play, and a letter which we publish in our Corre-

has hitherto been possible. So far as the import branch is concerned the new year has opened somewhat disastrously, as, in place of the usual increase, a decrease, as compared with the first month of 1907, of no less than £93,690 has to be recorded. Of complete cars only 297 were imported during the month, of a value of £105,967, these figures comparing with 447 and £181,250 respectively in the same period a year ago. The number of chassis imported was 142, valued at £46,014, while parts were responsible for £99,306, giving a combined total for January last of only £251,287, as against £344,977 in January, 1907, and £311,990 in the first month of 1906. Turning now to the section relating to the exports of British automobile productions, these show a slight advance—from, in the aggregate, £103,149 in January, 1907, to £107,152 last month. Altogether 172 complete cars (£66,289) and 29 chassis (£11,169) were despatched from this country in January, as well as parts to the extent of £29,694.

Motor Traffic at the Docks.

SADLY, yet none the less truly, has the chairman of practically every great railway company lamented the fact that the steam engines that run on tracks have no monopoly so far as conveying the people from place to place is concerned. Motor-buses have seriously threatened their suburban popularity and prosperity, and the modern railway manager has to face a set of circumstances very different to those which affronted the locomotive experts in the last century. Denunciation will not meet the case; those responsible for the traffic must look around for some means of meeting the new facts. Similarly we would advise the authorities at the docks. In several places motor traffic is now beginning to make its appearance at the harbours, and, as yet, the superintendents generally are unprepared for the innovation. Consequently complaints are rife of delays, which efficient organisation might obviate. How little has been the attention given to the matter by the dock authorities is shown in the "Industrial Motor Review," just published, which gives the regulations enforced at the leading docks and also reviews the whole country to prove that much has yet to be done.

Chief Constables and Drivers.

THE question of the welfare and qualification of drivers is attaining considerable importance in view of the remarks at several recent coroners' inquests, where drivers have been reprimanded for not exercising sufficient caution when on cars. On Saturday such an instance took place at Hammersmith, and after being reprimanded by the Coroner the driver in question intimated that he had decided to give up motor driving. The general subject has, however, gone much farther than this, for, on the authority of the Chief Constable of Manchester, Mr. R. Peacock, we are able to announce that the Chief Constables of the country have petitioned the Local Government Board to have some test for drivers before licences are granted. Such an intimation coming from the men who have to bear the burden of the administration of the Act will doubtless have considerable weight. The ill-favour into which the isolated acts of a few incompetent, or impertinent drivers may bring the whole body of motorists is well known, and now that the Chief Constables and the Clubs are giving the matter their serious attention leads to the hope that a great step forward may shortly be made.

'Bus v. Tram.

THE good people of southern Essex are appreciating the institution of a motor-bus service from Stratford to Seven Kings. Hitherto the traveller by road has had to go by the West Ham Borough electric tram to Forest Gate. Then a change for a half-mile ride by a horse tram to Manor Park has been necessary. The journey had then to be continued by an electric tram belonging to the East Ham Corporation as far as Ilford, when another tram conveyed the weary traveller to Seven Kings. The cost of travel by the four conveyances was fourpence; now the motor-bus takes the passenger right through for three-fourths of the fare in half the time—a distinct advantage which is much appreciated in the locality. Certainly it affords a demonstration of the advantage of the motor-bus over the tramcar.

Another Injustice to Motorists.

MOTORISTS journeying in districts where motor-cars are restricted to a ten-mile limit, or, it may be, prohibited altogether, are often at a disadvantage owing to the obscure manner in which the restriction or prohibition is indicated. Such an injustice has recently been brought to our notice. At Llandudno a London motorist was summoned a few days ago because he, in June last, exceeded the restricted speed limit in Mostyn Street, in that pleasant town. In the course of his

defence he pointed out that the notice as to the reduced speed limit of ten miles an hour was very indistinct, and in this one of the magistrates entirely agreed. In fact, he, a local man, had been unable to see the notice. His fellow-magistrates, however, did not regard this as an excuse for the defendant, who was fined 20s. and costs. If such limitations are to be respected it should certainly be the duty of the local authority to see that the notices under the Act are prominently and clearly set forth, otherwise considerable injustice will result. And where those directly responsible neglect their duty the motoring organisations should call attention to the matter.

The Production of Licences.

ANOTHER case has occurred where the magistrates dismissed a summons brought by the police against a motorist whose alleged failure to produce his licence was a mere quibble. The gentleman in question was stopped near Kingston for exceeding the legal limit, and when asked by the police to produce his licence showed them only that part containing his name and address, refusing to allow it out of his hands. For this they summoned him for "failing to produce his licence." The Bench decided to dismiss the summons, the chairman remarking that they did so because there was a doubt as to the obligation of the motorist in the matter. We are somewhat surprised at the latter remark, seeing that the Act is clear as to the word produce, and we cannot see why the police should endeavour to convert this into a detailed examination as to any previous endorsements that may have been entered. Sufficient instances have now been decided to give such cases the appearance of needless irritation.

No Warning Signs for Derbyshire.

IT is one of the curiosities of local government that those who know least about the subjects upon which they vote often decide important issues. Committees which have given time and thought to the consideration of important subjects discover that other people scarcely recognise facts and, often, light-heartedly reject proposals which are the fruits of experience and knowledge. Such a case has occurred in Derbyshire, where the County Council has rejected a proposal made by the Bridges and Highways Committee, who recommended the expenditure of £500 on the erection of danger-posts and signals in such places on the main roads as they considered advisable. They pointed out that most other counties were doing a similar thing, with the object of minimising the dangers of the road. Such a suggestion is not only reasonable but is strictly within the spirit of several circulars which the Local Government Board has issued to County Councils in connection with motor-car traffic. Hills and sudden corners on the roads cannot easily be flattened or straightened; and so the County Councils are erecting signs warning those who use the road of the risks in the vicinity. This is purely a precautionary measure, and it is a matter for surprise that the authorities of a county like that of Derbyshire should be disposed to take a narrow view of their obligations, not only to those who travel, but to those who walk as well.

FIAT MOTORS, LTD., have secured an order from the Marquis of Lansdowne for a 35-40-h.p. Fiat chassis, to be fitted with a limousine body by Hooper.

OF the 578 persons now on the unemployed register at Coventry, 386 are classified as belonging to the cycle and motor trade, as compared with 148 on the list at the corresponding period of last year.

WE are officially informed that the directors of the Liverpool Cycle and Motor Show have decided to make no allotment of space this year, and have returned the deposits to the firms who had already applied for space.

MR. LOVE, who is a vice-president of the Scottish Motor-Traders' Association, has a motor garage in Carlyle Road, Kirkcaldy. Love's Automobile Company is certainly well able to cater for the requirements of motorists journeying northwards.

Are Two Ignition Systems Necessary?

THE VIEWS OF SOME LEADING MANUFACTURERS AND AGENTS.

ONE feature of automobile construction in recent years has been the greatly increased favour which has been shown to the magneto as a means of furnishing the spark necessary to fire the explosive charge in the combustion chamber. At first the magnetos employed were all of the low-tension type, requiring some form of mechanical make and break device, but latterly a swing of the pendulum has taken place, with the result that the high-tension system is rapidly becoming the more popular form, enabling as it does the mechanical make and break device to be superseded by an electrical one, somewhat on the lines of that made familiar to old motorists by their acquaintance with the accumulator and coil method of ignition. While the makers of magneto machines claim that their productions have now reached such a degree of perfection that they may be safely relied upon to give satisfactory results in actual use, the practice of motor-car manufacturers for some time past has been—and in the majority of cases still continues—to equip their vehicles with two systems of ignition—magneto, high or low tension, and accumulator and coil. Notwithstanding this, however, there seems to be no question that the magneto is likely ere long to entirely supersede accumulators and coils, just as the latter displaced the tube ignition of the early days, an indication of which is seen in the fact that, despite the relatively high first cost of high-tension magnetos, they are now being adopted not only on four and six-cylinder engines, but on two and even single-cylinder motors. One advantage claimed for the provision of duplicate ignitions is the greater ease with which the engine can be started on the accumulators, it being possible, in the case of a multi-cylinder engine, with good compression, to put the motor in operation by simply switching on the current, and so saving the necessity of pulling round the starting handle. While this is an advantage to be by no means ignored, the similar object will sooner or later be achieved by an automatic engine-starting device; for, although so far the results of the efforts of engineers and inventors in this direction have not been altogether crowned with success, a really practical arrangement, with so many capable minds directed on the subject, cannot long be delayed.

Having in view the claims of the magneto manufacturers as to the reliability of their productions, it occurred to us that it would be useful and interesting to motorists if we endeavoured to secure from some of the leading motor-car makers and agents their reasons for fitting two systems of ignition, where this is done, and also, where only one method of ignition is employed, what has led them to this course. A ready response was made to the query we sent out, as will be seen from the replies appended.

Mr. P. Richardson favours a Duplicate System.

MR. PERCY RICHARDSON, the managing director of the Sheffield Simplex Motor Works, Ltd., considers that in a dual system of ignition, having two sets of sparking plugs, one set of the latter is superfluous. The usual form in fitting two ignitions is high-tension accumulator combined with high tension magneto, and when one has these two fitted it is generally found that the accumulator system is only used for starting, and the magneto for regular running, owing to it giving much better results, and, in consequence, if separate sets of plugs are used, those on the accumulator system are generally out of order when it is desired to use them.

"For my own part, I am strongly in favour of duplicating the parts of an ignition system that are liable to give trouble, and that whilst not in use are not inclined to require any attention to maintain in perfect order. The points that I think have been found by experience to require duplicating are (1) the primary source of current; (2) the coil. In the "Shef-

field-Simplex" dual ignition we use a high-tension magneto in combination with an accumulator, having separate high-tension coils, and low-tension distributors for each system. We use a common distributor for the high-tension circuit and one set of plugs. This distributor is so simple that we have found it never gives any trouble whatever, and, further, to make the high-tension wiring absolutely reliable we have all the conductors moulded in one multicore cable, the whole of which is vulcanised within an ebonite casing, making a perfectly sound job, and preventing oil or other deterrents from affecting the insulation. The terminals to the sparking plugs take the form of insulated switch handles, so that any of the cylinders can be instantly cut out, or the spark tested at the plugs, by merely lifting the switch handle. This makes a very simple arrangement for a dual ignition, and, as the low-tension distributor for the accumulator system is mounted on the distributing spindle of the magneto, it is very compact. In combination with this arrangement we have a self-starting switch on the accumulator system, which enables one to start the engine in this manner.

"There is no doubt that the modern high-tension magneto in the hands of the ordinary motorist has proved perfectly reliable, and gives much better running results in comparison with the amount of attention required to the accumulator system, but it has the disadvantages of not being able to be used as a self-starter, and also in cold weather it is not as easy to start on the high-tension magneto, hence the necessity for fitting, in connection with this, an accumulator system with a trembler coil, which, whilst not giving the same efficient running results as the magneto, makes up for the other defects mentioned, and at the same time forms a reserve ignition in the event of the magneto giving trouble at any time."

Mr. C. R. Garrard's Views.

MR. C. R. GARRARD, M.I.Mech.E., the works manager of Messrs. Clement-Talbot, Ltd., considers that the question as to whether a duplicate system of ignition is advisable depends to some extent upon circumstances. "If the customers who pay for the cars ask for two ignitions, then it would appear desirable to fit them. As for whether they are necessary, that is hardly the question. For general running I myself never make use of the accumulator ignition. I may do if I feel very lazy, in order to start up, but generally speaking, I prefer not to trouble anything about it, and I absolutely never look to see whether I have any accumulators on the car or not when I go out to try one, and the same remarks apply to several other officers at the Talbot works. If, however, I were a doctor making a number of calls I certainly should fit both ignitions. On the other hand, I never would run, without being compelled by stress of circumstances, on accumulator ignition, at any price. I may also say that we never use accumulator ignition in contests. Certainly, however, for doctor's work and town service give me the two ignitions, so that I may start off the switch nine times out of ten."

Mr. S. F. Edge in favour of a Single System.

"In my opinion," writes Mr. S. F. Edge, "duplicate ignition is not desirable on motor-cars. I generally find that the usual thing when there are two ignitions is that, whichever one is being operated, the other one is neglected, with the result that there is not a satisfactory stand-by if ever it is wanted. One good system of ignition seems to me to invariably meet the case; moreover, there is one particular part in each cylinder where a plug should be to get the most advantageous results, and with two systems of ignition, unless one has two sets of plugs, some of the benefits of the two systems disappear, while if two sets of plugs are fitted, then one set is always in a better position for firing the charge in the cylinder and causing the engine to run better than the other. My own opinion, therefore, is that one good system of ignition is best and sufficient for the purpose."

B

The Dennis Vehicles.

Mr. J. C. Dennis briefly sums up the views of Messrs. Dennis Bros. as follows:—"Although high-tension magneto machines have greatly improved of late, and can now be looked upon as absolutely reliable articles, yet we consider that where price is not being studied, a separate dual system of ignition is a valuable addition, especially when taking long tours."

The Brown Cars.

Mr. Albert Brown, of Messrs. Brown Bros., Ltd., replying to the question whether it is necessary to fit duplicate ignitions to cars, remarks:—"Our own experience has been that the two ignitions have certainly saved delay on the road. This, we think, is more specially so when the car is in a novice's hands. The latter can more readily locate a fault in accumulator ignition than he can in a magneto. Of this we have had numerous instances, trifling faults in the magneto having entirely baffled the owner's power of locating it, but having accumulator ignition he has been able to return home. We shall continue to fit two ignitions to our cars until we find that the public and the smaller repairers in the country have gained more experience with magnetos to allow them to be solely used."

The Aster Company.

Mr. S. W. Begbie, of the Aster Engineering Company, Ltd., thus summarises his views on the subject:—"We certainly think that it is necessary, where possible, to have an auxiliary stand-by in all machinery that is liable to trouble, and in the electric system of a motor-car—although it is more perfect to-day, and, in fact, we may say fairly reliable—the fact of having another ignition to fall back upon is not only a good insurance to the owner of the car, but is bound to be called into requisition at some period. We are fitting the majority of our engines this year for the complete independent double ignition, which clearly exposes our feeling on the subject."

Mr. D. M. Weigel's Views.

Mr. Weigel writes:—"I am not of the opinion that duplicate ignitions are necessary where magnetos are used. I, personally, cannot understand what they are fitted for, although my firm are continually fitting, by the desire of their customers, two ignitions. It is usually suggested, I believe, that if one breaks down the other can be used, but upon the same plea two back axles, two gear-boxes or two engines ought to be fitted to each car. It is quite true the magneto may go wrong, but it is suffi-

Mr. Charles Jarrott at the wheel of the 80'4-h.p. (R.A.C. rating) Lorraine-Dietrich Car on which he last week established a new fifty-mile record on the Brooklands Track, covering the distance in 36 min. 5 sec., equal to 83'1 miles per hour. [Campbell-Grey.]

The Brasier and Unic Practice.

Messrs. Mann and Overtons, Ltd., the British concessionaires for these vehicles, have never been advocates of a duplicate system of ignition. "Magneto ignition has," they state, "now reached so high a pitch of perfection that it is an extremely rare occurrence for the magneto to give trouble, and our experience tends to show that when trouble does occur it is almost always due to the magneto being allowed to become dirty through the negligence of the chauffeur. The ignition is by high-tension magneto in the case of the Uni, and by low-tension magneto in the Brasier; both systems have given the greatest satisfaction to customers to whom we have supplied these cars, and there is no question that magneto ignition gives far better results than accumulator ignition, and there is not the slightest difficulty in starting the engines."

The Fiat Company.

Mr. Sidney W. Lewis, on behalf of the Fiat Company, writes:—"The best answer we can give to the question is to state that Fiat cars have always been, and are still, fitted with magneto ignition only. The new live axle 28-35-h.p. and the new 45-h.p. six-cylinder cars, also the Fiat motor-cab, are fitted with high-tension magnetos, all the other models being provided with the low-tension type."

cient, in my opinion, to carry a spare magneto. We have arranged the fixing of the magnetos on the Weigel chassis as to permit of an exchange being effected certainly under five minutes. Other parts of the mechanism might break. They can all be exchanged and replaced in the space of a few minutes, and, therefore, it cannot be suggested that the difficulty in replacing a part necessitates duplicate ignitions. I have never known of trouble with the system of ignition applied by us to Weigel chassis, and have invariably found that customers have regretted the expense of having fitted two ignitions, and have in many cases been acquainted with the fact that the supplementary ignitions have been removed. I think that where a firm fixes a sufficient and satisfactory type of ignition it is all that is necessary."

The Ariel Company's Opinion.

Mr. E. Herington, of Ariel Motors, Ltd., informs us that for cars of 25-h.p. or under they consider the high-tension magneto ample, but for vehicles of 30-h.p. and over they recommend accumulator ignition in addition to magneto in order to facilitate starting, so as to obtain the additional advantage of being able to start off the switch.

Mr. W. M. Letts favours a Single Ignition.

"In my opinion," writes Mr. W. M. Letts, of Messrs.

Jarrott and Letts, "the day has gone by when it was necessary to fit two ignitions to any motor-car, that is, of course, providing it is fitted with the best magneto or coil and accumulator. We all know there are second-rate articles on the market, but my experience goes to show that all the first-class manufacturers fit the very best type of magneto or coil and accumulator. As far as we are concerned, the cars which we sell are always specified to be fitted with either low-tension or high-tension magnetos, and we never receive any complaints from our customers, nor are we ever asked to fit a dual ignition. Of course, if we were asked to do so we would fit it, but I think the last thing a customer now gets trouble with on his car is the ignition."

The Albion System.

Mr. T. Blackwood Murray, B.Sc., of the Albion Motor-Car Company, Limited, is a strong supporter of the single system. He considers that duplicate ignition systems are quite an unnecessary expense and complication, and, "in fact, the provision of a dual ignition appears to us to be a frank acknowledgment that the systems employed are unreliable and liable to a breakdown. We are, of course, staunch advocates of the low-tension magneto type of ignition, as such a system, if properly designed and manufactured, although more expensive in first cost, is undoubtedly the simplest and most reliable, and an experience extending over many years has amply proved that with such a system no stand-by system is necessary or desirable."

The Rover Company.

Mr. J. K. Starley, the works manager of the Rover Company, expresses the view of that concern on the subject by remarking that "both the high-tension magneto and the accumulator ignition with which we have experience are so reliable that there seems very little use in duplicating them. Seventy-five per cent. of the cars we sell are fitted with accumulator ignition only. Against that, all cars for foreign or colonial markets are fitted with magneto ignition as well, and from what we can gather they ask for accumulator ignition in addition solely for starting purposes, owing to the difficulty of keeping a magneto sufficiently well tuned to always ensure easy starting. When a magneto can be made which will start easily after some months of use in the hands of an ordinary inexperienced driver, or an accumulator be found which will hold its charge for several months, we think that only one ignition will be at all necessary."

The Vauxhall Company's Opinion.

Mr. T. Williams, of Vauxhall Motors, Ltd., in the course of a letter to us on the subject, remarks:—"We think that the question as to whether a reserve system of ignition is desirable or not is more a matter for each motorist to settle for himself according to his own particular opinion. In view of the fact that either magneto or coil and accumulator ignition are both very reliable and becoming better understood every day, we think that one system is sufficient, and an extra ignition may be looked upon as a luxury. Where the two are fitted the owner usually relies upon his magneto, and the other ignition falls into disuse for want of proper attention, so nullifying any advantage that may be gained by having both; but where the two-system advantage comes in, if both are properly looked after, is when driving in traffic the magneto can be switched off and the accumulators used, so obtaining a slower and quieter running engine."

THE delay on the part of the manufacturers of taximeters in supplying such instruments is held to be responsible for the slow development of the taximeter horse cab in the metropolis.

FROM Messrs. Beanland, Perkins and Co., School Close Works, Neville Street, Leeds, we have received a sample of Gre-Solvent. This is a preparation which should be found useful by motorists and motor-car drivers, it being designed for removing grease, as well as ink, paint, or other stains from the hands. It is claimed that the preparation contains no acids, but is in fact antiseptic. We have given it a trial and find that it certainly is effective in cleaning the hands, and as it is made up in tins of convenient size, one of them could usefully be found a place in the car tool box.

ROADS AND "EXTRAORDINARY" TRAFFIC.

IN the course of a paper which Mr. H. Howard Humphreys read on Monday before the Society of Road Traction Engineers, he gave some interesting figures from the returns of local taxation, which showed how much has been done to improve the main arteries of the country. Set forth in detail these show, taking urban and rural roads together, in the twelve months ending March 31st, 1896, the cost of 25,650 miles of main road was £1,778,791, or £68.34 per mile; ten years later, the cost of 27,380 miles of main road amounted to £2,478,481, or £90.51 per mile—an increase of 30.55 per cent. Now, these figures represent the average costs of urban and rural roads in the counties of England and Wales, but it will be useful, perhaps, to examine the returns rather more in detail, and it will then be shown that:—

- 1.—Between 1897 and 1905, 1,680 miles of road were added to the class known as "main roads."
- 2.—In 1905, county councils were directly maintaining 1,732 miles more main roads than they were in 1897.
- 3.—In the same period, urban district councils were maintaining 222 miles more main roads.
- 4.—In the same period, rural district councils were maintaining 274 miles less main roads.
- 5.—The increased cost of maintenance per mile in the case of the directly-maintained rural main roads was £17, or 30.9 per cent., whilst—
- 6.—The increased cost of the indirectly-maintained urban roads was £19 per mile, or 9.4 per cent.

Mr. Humphreys also referred to the subject of extraordinary traffic, for there is no doubt that the fear of incurring claims is acting as a deterrent upon many would-be purchasers of motor-lorries. County authorities seldom bring claims for damages of extraordinary traffic now, unless the circumstances are very unusual. The only county which has distinguished itself in the matter of these actions is Somersetshire, and the degree of success attained there has been extremely small; the real reason for these actions in that particular county is that the roads have been farmed out to local authorities, who persist in using soft local materials which crush readily, and are rapidly disintegrated by the weather. In a recent motor-lorry case at Bristol, the Judge, in giving judgment for the defendants, said: "In my opinion, as soon as a new form of transit has become usual, the road authority must bear the expense of maintaining the road, so as to carry traffic that must be reasonable."

The general trend of cases, during the last four years, appears to show that both High Court and County Court judges are increasingly unwilling to encourage local authorities in a policy of "passive resistance" to modern means of traction, and I look forward to a time when, as in the case of France, no extraordinary traffic action will be possible in reference to main roads of this country. On the other hand, the difficulties of local authorities should be recognised, and, so far as possible, highways should be studied as to time of travel, weight of load, quartering, &c., for an immense amount can be done to help the roads, if only owners and drivers of self-propelled vehicles will take the trouble to put themselves mentally in the position of those who have laid upon them the duty of upkeep. If surveyors, on the one hand, and owners of automobiles on the other, persist in regarding each other as natural enemies, the only people who will benefit will be lawyers and expert witnesses.

THE New Zealand mail just to hand brings the result of the largest motor-car reliability trial yet held in New Zealand. The course was from Christchurch to Dunedin and back, and in this the 18-24-h.p. Siddeley, driven by Mr. J. F. Hammersley, made a non-stop run, secured the full maximum of marks, and gained a gold medal.

UNDER the title "Monsieur, Madame, et l'Auto" M. Michel Corday has written, and M. E. Faquelle (11, Rue de Grenelle, Paris) has published, a volume of short stories in which the motor-car plays a prominent part. The tales range from grave to gay, but are all so interesting that one is loth to put the book down until the last page has been turned over.

THE BULLARD SPEED RECORDER.

WE illustrate herewith an extremely interesting combination instrument, consisting of a combined motor clock, odometer, and speed recorder, made by Mr. J. H. Bullard, of Springfield, Mass., U.S.A., which is being introduced into this country by the Universal Motor Imports, Ltd., of 10, Wilmington Square, Rosebery Avenue, London, E.C. The apparatus serves not only as a timekeeper and a distance

Fig. 1.—General View of Instrument.

recorder, but it makes a permanent and accurate record on a detachable card, about 3½ in. in diameter, of every quarter mile the car travels, at speeds of from 1 to 120 miles per hour, without any change in its mechanism, as also of what stoppages are made on the journey, and the duration of the same. Fig. 1 gives a view of the face of the instrument with the dial in place, while Fig. 2 depicts the interior mechanism of the apparatus, the cover

Fig. 2.—View of Interior Mechanism of Instrument.

dial, and recording card being removed. The latter, which is turned by a clock-movement and makes one complete revolution each hour in the same direction as the hands of a clock, is divided into sixty radial lines representing minutes, each fifth one being heavier than the others for convenience of reading, and also registering with the figures on the central dial. The time is shown by the Roman numeral seen at the top of Fig. 1, this denoting the hour, while the minutes are indicated by the

figure on the rotating central dial immediately below the pointer. The odometer is fitted at the top of the instrument.

Passing now to an explanation of the recording card, the anvil A (Fig. 1), at the bottom of the instrument has a stylus behind it which makes a dot or perforation in the paper for each quarter mile travelled, each fourth one being deeper to show the completed mile, no matter what the speed of the car may be. This stylus is operated both by the clock and the movement of the car, and is at the extreme outside space when the instrument is set for the beginning of a record, and moves towards the centre, one space per hour, being moved inward by the clock; it thus takes twelve hours for the stylus to move across the dial, and when this position is reached it is no longer operative until reset. The card is designed for records of an equal period, after which a new one must be inserted. The clock, however, will run for twenty-four hours. As already explained, the stylus makes a mark on the record at every quarter of a mile travelled by the car, no matter the time occupied; the space between the dots thus varies with the speed, being closer as the latter increases and wider apart as the car slows down. When the vehicle is at

rest the record card continues to rotate, in consonance with the clock, but the speed mechanism is not in operation, so that no marks are made on the card. In this way the numbers of minute divisions in which there are no dots indicate the duration of any stoppage en route.

The instrument is of interest, especially in view of the fact that magistrates have recently shown a tendency to accept the evidence of speed recorders, and have even gone so far as to recommend their adoption on motor vehicles in order that the drivers may have some idea as to the speed at which they are travelling, and so reduce it as to be within the legal limit. The record of the time occupied in making a journey and the various speeds attained en route are, as will be seen from Fig. 3, so clearly given on the automatically recorded card as to be indisputable evidence. This illustration is a reproduction of a card giving a record of a trip from Worcester to Springfield, U.S.A.; starting at 2.47 p.m., the first impression on the card is 1½ minutes later; arrived in Springfield at 5.50, the last impression being at 5.49, and the indicated distance being 49½ miles (the odometer on the car showing 50 miles). Reading from the outside line to the right towards the centre, it will be noticed that

six miles from Worcester the village of Leicester was reached, where the card shows that for one and a half miles the speed was reduced to comply with the local regulations, and that six miles further on, when passing through Spencer, a slow speed was again shown; also at other points along the line, in one instance to assist in getting a pair of frightened horses past. The dots may also be plainly seen in Fig. 1; in the latter case the car shows a speed of fifteen miles per hour, the dots being at exact minute intervals, or a mile in four minutes; it also shows that the time the last perforation was made was at 10.34½, and that the start was made at 10.29½. On the reverse side of the card blank lines are provided, as shown in Fig. 3, in which to fill in the complementary information, such as date, journey, distance, &c., to render the record of permanent value.

The instrument, which is enclosed in a heavy brass case, dust and waterproof, with a heavy beveled plate glass over the card, appears to be most thoroughly made in every particular. The cover is attached by a bayonet joint, so that it can be readily detached to permit of a new record card to be inserted at the end of twelve hours, or when starting on a journey. The appara-

CONTINENTAL NOTES.

Motor Buses and Railways.

One of the tunnels on the railway between Saargemund and Trier, Germany, recently fell in, and traffic between Mettlach and Ponten-Besseringen had to be suspended. In order to maintain communication along the line, the Prussian State Railway authorities secured ten N.A.G. 26-30-h.p. single-deck buses from one of the Berlin omnibus companies. As the passengers arrive at Mettlach they are conveyed to Ponten-Besseringen, and *vice versa*, in less than half an hour, notwithstanding the fact that the route is an extremely hilly one.

French Motor-car Exports.

According to the figures just issued by the Ministry of Finance, the exports of motor-cars and parts from France during last year attained a value of £5,814,560, as compared with £5,514,240 in 1906, and £4,010,040 in 1905. The United Kingdom is far and away the leading customer, having taken £2,416,480 of the total; Belgium second, with £619,680; Ger-

A Street in Pompeii.

Strada della Abondanza is one of the main arteries of the city and is a continuation of the Via Marina, by which the tourist enters the place. The illustration is from "Six weeks and the Mediterranean," published by Messrs. George Philip and Son, Ltd.

tus, which measures about 4½ in. in diameter, is mounted on the dashboard; it is connected with a joint that allows it to be turned at any angle which suits the driver. It is operated through the usual flexible shaft connecting it with gearing attached to the off-side front wheel of the vehicle. Means are provided for regulating both the clock and the speed-recording mechanism, and for resetting the stylus to its extreme outward position.

A NEW 14-16-h.p. four-cylinder live axle car built by the Fabrique Nationale d'Armes de Guerre, of Herstal, Belgium, is being introduced into this country by the F.N. Motor Agency, of 106, Great Portland Street, London, W.

IN the four days' reliability trial organised by the Motor Union of Western India, consisting of a run from Bombay to Kolhapore and back *via* Mahabaleshwar, which finished last Wednesday, a 40-h.p. Siddeley completed the distance with a clean non-stop record.

many third, with £544,040; the United States fourth, with £434,840; and the Argentine Republic fifth, with £224,000.

Military Motor Vehicles in Germany.

Fifty-two lieutenants of the German Army Reserve have been transferred to the Motor Transport Corps, and will be employed in a periodical inspection of motor lorries and vans in private owner-ship, which might be useful in case of war. A vote of £40,000 in the present estimates is to be distributed as bonuses among the owners of such vehicles as will agree to place them at the disposal of the German War Office in case of mobilisation.

The A.C.F. Grand Prix des Voitures.

With the view of encouraging a large entry for the voiturette race which is to be held in July next, the day preceding or following the Grand Prix contest, the French Automobile Club has decided to reduce the entry fees to £20 for one car,

£36 for two vehicles, and £48 for three. It has been decided that the voiturette and heavy car races shall be held on July 6th and 7th. A separate prize consisting of an object of art will be presented by the Dieppe municipality to the winner, irrespective of nationality, of the contest for big cars.

Motor Vans for the Spanish Postal Service.

The Spanish postal authorities in Madrid are reported to be contemplating adopting motor delivery vans on a large scale, and are prepared to receive particulars of suitable vehicles from manufacturers.

A Trial of Motor-Cabs in France.

The French Automobile Club has just decided to organise a trial of motor-cabs, using carburetted alcohol as fuel, at the same time as the industrial vehicle competition in May next. The vehicles will be divided into categories—those having single-cylinder engines being permitted a maximum bore of 100 mm. and those with four cylinders 80 mm., and others, apparently, in proportion. The weight of the cabs will also be in relation to the engine capacity, being 1,000 kilog. for those with single-cylinder engines up to 100 mm. bore. The rules provide for a maximum speed of 30 kilometres per hour, and limit the number of spare tyre covers and tubes that the vehicles will be allowed.

The Petrol Motor-Wagon which an Asphalt Pavement Repairing Company in Berlin is now using for the transport of its material about the city.

For the final classification, the cabs which successfully complete the programme of daily runs will be subjected to a petrol consumption test—on a kilometre-ton basis—in which the speed will also be taken into account.

More Races in Italy.

The municipal authorities of Verona, in conjunction with the Venetian Automobile Club, are organising a motor race meeting for March 15th next. The event, which will be run over a 27 kilometre circuit, is open for three classes of cars, viz.:—(1), four cylinder vehicles, maximum bore, 110 mm., minimum weight of car, 950 kilog.; (2), ditto up to 120 mm. and 1,050 kilog. respectively, and (3), ditto up to 130 mm. and 1,100 kilog. Entries at £4 per car may be sent until March 5th to the Automobile Club Veneto, 19, Via Marsala, Padua.

Motor-Car Accidents in France.

The Commission of Judiciary Reforms of the French Chamber has adopted the recommendations in the report on automobile accidents. These provide that every driver of any species of vehicle who in case of an accident occasioned by the car he is in charge of fails to pull up, or endeavours to escape any responsibility, civil or criminal, he may have incurred, shall be liable to a term of from six to sixty days' imprisonment and a

fine of from 16 fr. to 200 fr. In the case of his having incurred a penal sentence the above punishment may be doubled.

A New Fuel for Motor Cars.

From Stockholm comes the news that two Swedish engineers have produced a new fuel for petrol motor-cars, which not only gives greater power than petrol, but can be produced more cheaply. The new fuel is to be known as "Autolin."

Garage Charges in Paris.

The French Chambre Syndicale de l'Automobile has just issued a standard scale of charges which is being adopted by garage owners in Paris. The rent per month varies in accordance with the length of the car, and ranges from 40 francs for a vehicle 10 ft. long to 60 francs for those up to an over-all length of 16 ft. 6 in. The charge for a single day's garage is 4 francs.

Public Services in Austria.

A public electric motor-car service is about to be established between Weidling and Klosterneuburg, a distance of 4½ kilometres. The line will be on the rail-less trolley system, that is, to say, the vehicles will run on the ordinary road and take their energy from overhead conductors. Three cars have already been ordered for the line from the Austrian Daimler Motor Company, of Vienna.

The A.C.F. Grand Prix Races.

M. Clemenceau, the French Minister of the Interior, has authorised the A.C.F. Grand Prix meeting, which will be held on the Dieppe circuit on July 6th and 7th. Three Motobloc cars have now been entered for the big car event, bringing up the total entries to date to fifteen, while for the Grand Prix des Voiturettes race thirteen entries have been received, viz., three Isotta-Fraschini, three Lion-Peugeot, three Rolland-Pilain, a Fouillaron, and three Le Gui vehicles, the latter being made by Messrs. Guillemin and Co.

Miscellaneous Items.

A syndicate of the manufacturers of non-skids in France has just been formed in Paris.—Owing to the bad weather the hill-climbing competition which was to have been held on the Medea Hill, Algeria, on Sunday last has been postponed until the 16th inst.—The scouts who have just been put on the roads in Paris by the Association Generale Automobile have quickly been nicknamed "les anges gardiens," or guardian angels.—An Adler petrol motor delivery van is being put in service by the postal authorities in Leipzig.—Four hill-climbing competitions will be held in Austria during the coming summer, including the Semmering event on September 20th and a joint meeting organised by the Austrian and German clubs in June.—During the first nine months of last year 344 motor-cars were imported into Russia as against only 242 during the whole of 1906.—The Automobile Club of Guipuzcoa (Spain) proposes to hold a hill-climbing competition near San Sebastian during the coming season.—The first 1908 Clement-Bayard racer left the works on Monday, Riga being at the wheel.

THE National Bank of Commerce of St. Louis, U.S.A., has recently put into commission a special electric motor vehicle built by the Studebaker Automobile Company, of South Bend, Ind., U.S.A. The chassis is of the standard type, while the body is built to the bank's specifications. A door opens on each side in the centre; just in the rear of the driver's seat, and extending under it is located a strong box made of wood and lined with heavy sheet steel. This is divided into five compartments and fitted with a strong lock. Inside the body in the rear, extending across its full width, is located a seat for the person in charge of the vehicle and the officer or guard. The van, which is used for carrying money between the bank and Sub-Treasury, and also between various offices in the city, has a capacity of 10 cwt., a radius of forty miles on one charge, and a speed of twelve miles per hour.

THE DAIMLER COMPANY have received an order from H.H. Maharajah Ranjitsinji Jam Navanagar for a 42-h.p. "Coombe" shooting brake.

THE retreading of tyres and fitting of non-skid bands is being undertaken by Messrs. H. Andrew and Co. at their depot in Athenæum Place, Plymouth.

MR. W. F. STROUD has accommodation for more than thirty cars at his motor garage at Woodhall Spa, a much-favoured resort of Lincolnshire motorists.

MR. H. NANCARROW has a motor garage in Truro which is well planned and equipped. In addition to the repair of motor-cars he undertakes the overhaul of motor launches.

THE Pendleton Radiator Company, of Pendleton, Manchester, are devoting special attention to the manufacture of radiators, bonnets, silencers, petrol tanks, and other sheet metal parts for motor-cars.

J. H. PATTERN has been sentenced at the Old Bailey to eighteen months' hard labour in connection with the conversion of a motor-car to his own use and benefit. He had previously been concerned in other motor-car robberies in London.

ATTENTION is drawn to the danger and expense of using motor spirit for cleaning motor-cars by the British Petroleum Company, Ltd., who suggest that for this purpose ordinary lamp oil is quite suitable; less dangerous, and more economical.

AMONGST the recent orders for Crossley chainless cars secured by Messrs. Jarrott and Letts, Ltd., are those from Mr. Charles Pincock, of the London Corn Exchange, Mr. H. V. Soames, of Kensington, and Mr. J. W. Harrison, of Sandwich, Kent.

THE import duty on pneumatic tyres in Brazil has been reduced from 50 per cent. to 5 per cent. in order to encourage the development of the automobile movement in the country. The duty on automobiles was similarly reduced several years ago, when it was neglected to extend this reduction to extra tyres.

THE Simplex Engines, Ltd., Coventry, are now making a four-cylinder engine with the magneto drive contained in the crank case, bringing the magneto and pump alongside the motor. Owing to this arrangement and the use of ball bearings the engine is very short, and can be fitted into the space of an ordinary two-cylinder motor.

THE Botanic Gardens Motor Garage is one of the most complete and extensive establishments of its kind in and about the city of St. Mungo. It is situated in Vinicombe Street, Hill Head, Glasgow, and has been erected by Mr. Alexander Kennedy with a view to the accommodation of at least sixty motor-cars and the repair of any disabled ones that go that way.

It is stated that experiments with a view of determining the practicability of extending the use of automobiles are in contemplation by the Quartermaster-General of the U.S. Army. Motor vehicles have already been employed to some extent, such as for passenger transportation, for headquarters in the field, signal corps wagons and ambulances, but now the authorities have in view tests to demonstrate the efficiency of motor vehicles for the transportation of heavy stores in the field, under all conditions to be met in the service, such as hilly country, bad roads and long distances from sources of supply of fuel.

A FEW weeks ago we gave some particulars of the motor service which is being run by the proprietors of "The Eastern Daily Press" for the distribution of their journal in outlying districts. The figures were for the first eleven months in 1907. We have now received details of the complete record for the year. The number of days on which the car was sent out was 309, and on 299 of these every rail and mail connection was made. The total distance covered was more than 27,000 miles. Six of the failures were due to fog. On two days there were partial failures due to tyres, and on two other days partial failures due to machinery. As previously mentioned, a Siddeley car is used, and the record shown not only demonstrates the use of the motor-car for commercial purposes, but is also a standing testimonial to the efficiency and reliability of the vehicle employed.

UNDER the auspices of the Royal Sanitary Institute a conference on present-day road requirements is being held this week-end at Nottingham.

It is reported that a group of Spanish sportsmen intend to hold a motor-car race on the Island of Majorca, one of the Balearic Islands, in September next.

MR. J. R. STATHAM, who has a garage at Kilkenny, is doing good business in motor repairing of all kinds, being situated in a district where the bad roads are very trying to tyres.

THE petrol motor ambulance recently ordered by the Corporation of Salford has now been completed. The chassis was built by the Empress Motor Company, Ltd., Manchester, and the body by Messrs. Wilson and Stockall, of Bury.

MR. B. J. F. BENTLEY, who left England last summer with a view to motoring across Somaliland and Abyssinia to Khartoum, and then by the Nile Valley to Alexandria, recently reached Adis Abeba—the half-way house from Djibouti to Khartoum—after an adventurous journey of four months. The Siddeley 18-h.p. car which he is driving was the first vehicle of any kind to cross Somaliland, and he received many congratula-

tions on his feat, which is regarded locally as a wonderful one. H.M. Emperor Menelik showed great personal interest in the performance, and a day or two after the arrival at Adis Abeba accompanied Mr. Bentley for a trip on the car, subsequently driving it several miles. In the accompanying illustration Mr. Bentley is seen driving the vehicle, with H.M. the Emperor on his left, while the back seats are occupied by the British and American Ministers.

THE Contest Committee of the American Automobile Club announces that, owing to the fact that the trustees of the Dewar Trophy will not consent to the qualifying conditions laid down by the committee (that cars to be eligible to compete for said trophy should cover 100 miles at an average speed of sixty miles per hour), this race has been struck out of the programme of the forthcoming Ormond-Daytona (Florida) meeting. It is probable, however, that a one mile competitive race for a trophy will be substituted in its place. The conditions for the invitation race for gentlemen amateur drivers have been amended, so that any gentleman invited to drive in this event is not obliged to own the car, but can borrow or secure a car or chassis provided he drives it himself.

THE Mysore Cup in the Indian Trials has been won by a Fiat car.

AT Kirkcaldy Messrs. Eugene Descamps and Co. have a large motor garage.

It is reported that the Sultan of Turkey has ordered twenty motor-cars from a German firm.

PRINCE HENRY OF PRUSSIA has just placed an order with the Benz Company for a six-cylinder car.

LAST year 2,003 driving licences were granted, while 1,609 cars were registered in the city of Manchester.

MR. B. R. THORNTON, Granville Lodge, Hove, is taking an active part in the opposition to the proposed motor roads.

A COACHBUILDING department has been added to the motor establishment of Mr. Gibbons-Brooks, in Queen Street, Cardiff.

THE leading paper of Amsterdam, "De Telegraaf," is using a number of Humber cars for the rapid conveyance of newspapers in the Dutch capital.

THE Star Engineering Company have appointed Messrs. George and Jobling, of Newcastle-on-Tyne, the agents for Star cars in the districts of Newcastle and Darlington.

WE illustrate herewith a 12-h.p. vehicle which has been specially constructed by the Star Engineering Company for motor-cab use in accordance with the requirements of the Metropolitan Police regulations. The car is fitted with one of the latest Star four-cylinder engines $3\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, with high tension magneto ignition. The cab body is high-class

in every respect, the head being made of enamelled leather, and the inside upholstered in leather with spring cushions. The vehicle is designed to carry two persons inside with an extra lift-up seat for a third passenger if required. The type illustrated has side chain transmission, but a similar one with live axle can also be supplied.

A MOTOR-BOAT race meeting will probably be held this year at Gravesend under the aegis of the Racing Committee of the British Motor Boat Club. The meeting will, doubtless, be strongly supported by the Essex Motor Boat Club.

It was reported at the Surrey County Council on Tuesday that during the past year 401 motor-cars were registered in the county and 244 motor-cycles, whilst 4,725 drivers were licensed. The total receipts under the Motor Car Act during the year were £1,732, excluding, of course, the fines imposed on motorists in the courts.

A DEMONSTRATION of a new device for curing puncture troubles was given in London last week. It consists of a special inner tube, to which the name "Sealomatic" has been given. The tube is provided with a double lining made of a patented material, and it is claimed that nails, flints and the usual impediments that puncture tyres will not cause these tubes to become deflated. We hope to refer more fully to the new tube in a future issue, but, in the meantime, may state that it can be seen at the premises of Messrs. Gillespie and Co., 226, Vauxhall Bridge Road, London, S.W.

MESSRS. GADSDON, HULBERT AND CO. have extended their garage in the High Street, Bognor.

MR. C. LEETE is the manager of the Hoylake Garage at the Quadrant, Hoylake, Cheshire.

ACCORDING to a report from Rio de Janeiro, Brazil, there are at present about 350 motor-cars in use in that city.

WE learn that the Lansdowne Motor Garage, of Norwood, is giving free garage to motor-cyclists visiting the Crystal Palace.

A PRIVATE service of motor-wagonettes is to be run between Darnall tram terminus and Swallownest, via Handsworth and Woodhouse Mill.

110, High Street, Marylebone, London, W., is now occupied by Mr. Walter Dickinson, who has opened the premises for the sale of high-grade motor bodies.

THE police in the neighbourhood of Birmingham have lately been extremely active in summoning motorists for driving cars without having the rear number illuminated.

AT the meeting of the Rugby Engineering Company on Thursday, Mr. Bernard Hopps read a paper on "The London Motor Omnibus Problem," with special reference to the petrol-electric system.

MR. J. GROSE, of the well-known firm of Messrs. J. Grose, Ltd., of Northampton, who has long been identified with non-skids for motors, is placing a number of motor-cabs in service in Northampton.

THE West Sussex County Council has authorised the purchase of a motor-car for the use of the County Surveyor at a cost not exceeding £250 net—i.e., after allowing for the price to be obtained for the old car.

COMPLAINTS have been made to the Motor Union of the erection of unauthorised speed restriction notices near Chippenham and Stratford-on-Avon, and steps have been taken to bring the complaints to the notice of the authorities concerned.

THE awakening of the motor season is apparent from the inquiries which seem to be about for non-skids, and the Durandal device is, of course, receiving attention in this connection. With tyres kept well inflated this speciality, introduced by Messrs. Stuart Morrison and Co., 199, Piccadilly, W., has certainly proved its value—both in durability and in the effective prevention of skidding.

A TRIAL under the official observation of the Scottish Automobile Club, extending over three days, of "Ross" Motor Spirit, a product of Scotch shale, manufactured by Messrs. James Ross and Co., Philipstoun Oil Works, Linlithgow, has been made on a 40-h.p. Berliet car. The route followed embraced Edinburgh, Abington, Carlisle, Newton Stewart, Ayr, Greenock, Glasgow and Stirling.

FROM the Slew Tyre and Wheel Company, Ltd., of 15, High Street, Manchester, comes a pamphlet illustrating and describing a new tyre and wheel for motor-cars they are introducing. The tyre is of a special construction, comprising an arch of solid rubber, supported only at the sides by a double grip, and consolidated by rubber bridges, provision being made to prevent both lateral and circumferential movement. It is claimed that the tyre compares in action and resiliency most favourably with pneumatics, without possessing any of the faults of the latter.

MR. CHARLES JARROTT, on his 80.4-h.p. (R.A.C. rating) Lorraine De Dietrich, set up a new record for fifty miles at Brooklands on Wednesday, the 5th inst., his time being 36 min. 5.75 sec., this being equal to a speed of 83.112 miles an hour. It was Mr. Jarrott's intention to secure also the hour record, but unfortunately his rear tyre collapsed when he had only about ten minutes to run and about eight miles to go to secure the record, consequently he gave up the attempt for that day, being satisfied with having made the record for the fifty miles. Mr. Jarrott will attempt both the 100 miles and the hour record in the near future. It is interesting to recall that Mr. Jarrott was the first arrival at Bordeaux in the heavy car class in the lamentable Paris-Madrid race. He was at that time driving the same make of car, namely, the Lorraine de Dietrich, and averaged over sixty miles an hour on the road from Paris to Bordeaux.

FROM PARIS TO VIENNA BY MOTOR-CAR.

(Concluded from page 1085.)

AT ROMANSHORN, on the Bodensee, more Customs and more delays, and, at the hotel, no garage. When will mine host wake up to the requirements of well-to-do motorists who have money to spend? Cleanliness, attention, and good food were quite exceptional, and the attitude all along is "If you don't like it, go without." We therefore went without these small necessities of life and made the best of things. The distance run during the second day was 190 miles, and no stop of any kind was recorded against the car.

At Reineck, the next morning, we left Swiss territory for good, and were now once more on Austrian soil. A detour of about twelve miles was made to Bregenz, where letters were awaiting us, and after passing Feldkirk we began the climb up the Arlberg mountains. For some reason or other the car went better this day than on previous days, and we were very seldom off the top speed. Perhaps the little motor knew what was expected of it, and put its best foot forward, and never faltered or hesitated for one moment during the long and arduous climb. Occasionally steep bits called for a lower gear, and at Stuben we halted for a few moments to replenish our water supply. Our arrival here was heralded with a chorus of surprise. The smallness of the car and the size of our bonnet depicted a tiny motor, and as many powerful four-cylinder vehicles had tailed at this ascent, the peasants would hardly believe that we had not been towed up by a team of horses. This, by the way, is a familiar sight in this district, and a good many of the inhabitants went back a few hundred yards to see if we had left our team behind a bend in the road. As nothing was in sight they concluded that the two-cylinder motor had done the work, and we were congratulated on all sides. The inhabitants along the route had lively recollections of the Paris-Vienna motor race, and we heard many exciting incidents repeated. We were pointed out certain horses which had dragged several racers up this formidable climb, and numerous points where narrow shaves occurred were carefully brought to our notice.

Once more *en route*, and a few miles further on we breasted the mountain, and our little voiturette had conquered the famous ascent. The descent extended over about nineteen miles, and a careful scrutiny and adjustment of our brakes was a necessary precaution before the start. Nearing Innsbruck several sharp ascents gave the motor all it wanted, and we were not sorry to reach Rattenberg, a charming little town of much historical interest in the Unterinntal, 190 miles away from our starting-point in the morning.

The mile and direction posts which are so admirably arranged in France were very much missed on the latter part of our journey. In the Tyrol and Salzburg districts, those at the roadside were worse than useless. Instead of giving the distance to the next town in kilometres, it was given in hours and minutes. This gave us little information as to the distance, unless one calculated on the basis, say, of walking six kilometres an hour. Civilisation in these districts wants much improving. The danger or caution boards are also worthy of a growl. In France, one can easily read the inscription and drive accordingly. In Austria, however, things are different. Ten or twelve lines of small type, which no man can read, give the desired information, and as the notice is perched on rather a high pole, telescopes are necessary to understand what it says. Otherwise, the trip was very pleasant, and as we drove very cautiously we took no risks and did not trouble much about the signs.

The country through which we travelled was really magnificent, and the population very well disposed to motorists. The children waved flags as we passed by, and we enjoyed every minute of the day. We reached Amstetten at seven o'clock, having travelled just under 200 miles in the day. As Vienna was only seventy miles away, we could easily have pushed on and reached it before midnight, thus completing the journey in four days. We were, however, not out for a race, and decided to

have a night's rest and complete the journey in daylight. Reliability was our motto, and not speed, although some of the days' travel, especially the first one of 360 kilometres, showed what the little car was capable of doing when running with throttle wide open. We were favoured with fine weather all the time, and experienced a most delightful trip through country which is not excelled from the scenic point of view by any in the world. The motor ran like a clock, and the only stop for mechanical trouble was to replace a joint in the water circulation, the rubber part of which had perished. This caused a few minutes' delay, as did also one puncture. We carried a cylinder of compressed air, which soon inflated the tyre, and the outer covers wore splendidly.

A View on the Strub Pass.

We did not keep an accurate record of the petrol used, but we must have averaged quite thirty miles to the gallon. Thirteen pints of lubricating oil were all that were required, and no other expense whatever was incurred during the trip.

THE motor engineering class previously held by the Eastbourne Education Committee having been so successful the Committee contemplate arranging another course of lectures, to be addressed by Mr. P. Ellison, providing a sufficient number of students can be got together. Prospective students should forward their names to the Town Clerk (Mr. H. W. Fovargue) not later than Monday next.

MR. T. BIGNALL, the London manager of the Acre Rubber Company, Ltd., is receiving satisfactory expressions of users' opinions of the new "Arco" combination non-skid band. In the improved pattern the rubber tread is as before, but the leather strip now extends over the walls of the cover, and while the utmost resiliency is retained, the wide leather tread is skid-proof and practically unpuncturable. Between the cover proper and the non-skid band are inserted strips of leather specially treated with rubber, so that the inner portions of the metallic studs cannot injure the tyre. When the non-slipping band, therefore, has been worn right down to the rubber, a new band may be fitted with perfect safety, the body of the tyre having been protected from injury. The new "Arco" band can be mounted on any maker's outer covers, and is particularly adaptable to covers formerly fitted with non-skid bands of other types.

Correspondence.

[Letters to the Editor should be addressed to the office, 27-28, Charing Cross Road, London, W.C.]

THE RULES OF THE A.C.F. GRAND PRIX RACE.

To the Editor of *The Motor-Car Journal*.

SIR,—I see a letter in a recent issue of yours from M. Paul Meyan trying to justify the French Automobile Club in allowing detachable rims in the Grand Prix but barring the British equivalent—the detachable wheel. M. Paul Meyan says the detachable wheel is bringing in a principle that, if allowed, would entitle people to change gear-boxes and other vital parts. He is evidently unaware that the detachable wheel in this country is considered by the highest in the land to be at least the equivalent to the detachable rim, as it makes a better motor-car, whereas the detachable rim makes a worse motor-car, as it adds weight in the part where it is the greatest disadvantage, viz., the revolving wheel.

The detachable wheel is used by, amongst others in this country, His Grace the Duke of Bedford, the Right Hon. Lord Londsdale, the Rt. Hon. A. J. Balfour, and Sir George Pilkington. Surely these names are sufficient to show that it is a device for the touring car and not primarily for the racing car. I think it exceedingly clever of the French Club to try and get the world to believe that the detachable rim is the best method of rapidly repairing a deflated tyre, but as I know it is not I do not intend to allow the French motor industry to trap me into a race with a device which I do not agree with, and

Napier ran equipped with the French device, it is, to people who do not know the facts, an admission that Great Britain has to go to France for its motor requirements and ideas.

These big races are held for the purpose of trying to place one country's manufacturers in the eyes of the world ahead of others. I will not, as one interested in British motor-cars, do anything which in my opinion jeopardises the British industry or places it in a false position.—Yours truly,

S. F. EDGE.

SOME FEATURES OF 1908 ENGINES.

To the Editor of *The Motor-Car Journal*.

SIR,—I have only just, owing to absence from town, seen your issue of the 31st ultimo, and the article therein concerning Mr. Baillie's paper entitled "Some Features of 1908 Engines." I notice what he says regarding the inlet piping on the "Porthos," and that he suggests that whilst we now use the single straight piping with the carburettor connected at one end of it, it would be just as easy to have the connection in the middle. May I inform Mr. Baillie, through the medium of your columns, and also the public, who no doubt read the article, firstly, it is not the carburettor which is fitted to the end of the

The Darraq-Serpellet Steam Bus which has just been put in service in Paris between the Lyon and St. Lazare Railway Stations.

of which a British inventor has already produced a far superior equivalent.

I also notice a letter in your last issue from a correspondent famous, amongst other things, for leading forlorn hopes, and championing the foreigner and his motor-car. In his arguments to try and make out that the present Grand Prix Rules are fair ones, although they allow a rapid French means of detaching the tyres, but bar the British equivalent, he is omitting one very important fact when dealing with the Paris-Berlin and the Paris-Vienna and other well-known races, and that is at this period not only were the hubs of the wheels stamped, but the rims. It is therefore quite clear that the rules standing at this time were departed from for the Grand Prix of 1906, when the fact that detachable rims were used by a few competitors gave the French constructor an enormous advantage over other competitors who had not the opportunity of using them in the race, and enabled the French to win the race, which might very easily, if the detachable rim had not been allowed, have gone to another country. His comparison of the changing of a tyre by the use of a detachable wheel is quite different to changing a gear-box, and he must himself realise that the parallel is not a fair or reasonable one.

My feeling in the matter is purely a personal one. I have not a penny piece of financial interest in the Rudge Whitworth detachable wheel, but from experience I know it to be the best device at present known for coping with tyre troubles. Therefore I have no intention that the six-cylinder Napier shall assist the French industry by using a device which allows for replacement of tyres when there is a British equivalent far in advance, and which, if used in a big international road race, would become known world wide through its advantages and thus place the British industry in this particular well in front of the French, whereas if the French have their way and the six-cylinder

exhaust pipe but it is the mixing chamber; secondly, last year we used to fit the mixing chamber in the position kindly suggested by Mr. Baillie, i.e., the centre, but we found that very much better results are obtained by fitting it at the end. When doing this we fully realised that we should lay ourselves open to hostile criticism, and you can, therefore, quite readily understand that we should not have made this radical alteration unless we were fully satisfied that an advantage must be gained from it.

Mr. Baillie kindly remarked that he could not help thinking that the end connection had been made for some reason which escaped his intelligence. Naturally there was a reason for it, and I doubt very much if anyone but Mr. Kieffer, the inventor and patentee of the Porthos carburettor, and ourselves are aware of this reason, and you can quite understand that we do not propose to give the trade the benefit of it.

I should very much like, however, to take anyone who read and was interested in this article for a run on one of our last year models, and then immediately afterwards give him a run on one of the new models, when he could observe the difference for himself, although I much doubt if he would know the cause.

On the subject of exhaust piping Mr. Baillie gave the names of several cars which are fitted with expansion joints. I would like, in the interest of my company, to mention that the Porthos has been fitted with expansion joints for the last three years, Mr. Baillie having omitted to mention this fact whilst naming the other cars that are similarly fitted.

Apologising for the length of this letter and trusting that as you have inserted Mr. Baillie's opinion on the points enumerated above, you will allow my reply to him to be inserted.—Yours truly,

COLIN DEFRIES.

HILL CLIMBING IN EDINBURGH.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The account given in the last number of the *M.C.J.* of the performance of a car driven by my friend Mr. Percy Richardson is rather misleading. Frederick Street, in Edinburgh, is quite a short street—not more than a quarter of a mile, and half of it is up hill and half down hill, as shown by the section given in the notice. The section shows Comely Bank, Raeburn Place, Stock Bridge, N.E. Circus Place, and Howe Street in addition to Frederick Street. It is quite a mistake to say that there are "two bad turns" on the route.

The performance on Ramsey Lane deserves all praise. That is really a stiff and difficult ascent.—Yours truly,

J. H. A. MACDONALD.

POLICE TRAP AT CRAWLEY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Once again I am sending you particulars of the latest dodge the police have in this (Crawley) district. The last few Sundays they have secreted themselves in various places from the Sun Inn, the London side of Crawley, to Hoggs Hill, going from Crawley to Brighton. They now conceal themselves behind the Sun Inn buildings and a barn about 220 yds. nearer Crawley, both situated some distance back from the road, therefore it is impossible for the scouts or anybody travelling through to see them before they are pulled up, as one found out to his cost yesterday. Motorists must also drive cautiously every day of the week from the county boundary, two miles London side of Crawley, to

open class. The prizes for this class will be gold, silver, and bronze medals and certificate. The winner of the gold medal will also be awarded a free insurance for twelve months on his motor-car up to an unlimited amount, which policy will be given by the Car and General Insurance Corporation.—Yours truly,

WILFRED GROOM.

THE SETTING OF VALVES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the letter from "Interested Enquirer" in last week's *M.C.J.*, he is quite right in noticing that we have our exhaust valves open a long time, and, as he remarks, so late that the inlet has commenced to open. Now will he carefully work out from your article how soon the inlet valve opens before the exhaust has closed, and explain what the results will be on different engines? He says he is sorry he cannot produce the two engines he wrote about, but cites another instance that he cannot prove; in fact, he can go on producing—on paper—several instances to prove he is right. Well, we might argue the same way till doomsday, but an ounce of facts is worth a pound of theory. Now we will make him a sporting offer, so that it will be worth his while, or anyone else who doubts our claim. We are prepared to deposit with the Editor of this paper the sum of £50, to be paid to anyone who will produce two petrol engines, one high and one low speed, that we cannot make run better, set to our standard setting, than they will with any other. All we ask is that some impartial umpire shall witness the test, which can take place on the track here at Bexhill, and after it has been proved that we are right, then your correspondent shall pay

Touring in Spain.—A couple of Daimler Cars at the Level Crossing, Escorial.

half a mile Brighton side of the level crossings, otherwise they may fall victims to these underhanded traps.

Trusting you will insert this that the police tactics may be laid low, especially now that the objections re speed limit ten miles per hour is advertised by the Local Government Board to be lodged by end of this month.—Yours truly,

JUSTICE.

FROME'S HILL CLIMB.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to the decision of the Royal Automobile Club not to grant any permits for hill climbs on public roads this year, I shall be very glad if the competitors will communicate to me their wishes with regard to the holding of the above contest, taking into consideration the way in which the Herefordshire people welcomed them and the manner in which the contest was conducted.

Although I have ceased to act as hon. secretary of the Herefordshire Automobile Club, they have requested me to act as hon. secretary for the contest in the event of our being successful in getting a permit. Will the competitors kindly communicate with me to the office of the Car and General Insurance Corporation, 29, St. Andrew Square, Edinburgh?

It is proposed to use the same formula as last year, but some of the rules will be altered, namely, the one requiring an observer, and that requiring the competitors to be at Hereford the day before. We propose to do away with observers and to have the cars weighed the morning of the contest, and hold the contest itself in the afternoon. It will not be necessary to declare the weight on the entry forms. The classification will be the same, but, in addition to last year's class, there will be another for strictly private owners, the competitors in which will be eligible for the

the cost of setting, which will be very little compared with the £50 he stands to win.—Yours truly,

LARRAD'S PATENTS SYNDICATE.

ADJUSTABLE RIMS AND WEAR OF TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of February 8th there is a letter from "Nelson" headed "Adjustable Rims and Wear of Tyres," and on the same points there has been through the motor Press a considerable amount of correspondence. It has been suggested that as each type of adjustable rim, or as it is more generally known "detachable rim," is associated with a particular make of tyre, the maker of the tyre trades on the fact that the possessor of a car so fitted is bound to him for tyres and therefore eases up in his efforts to produce the best possible article. This is probably an erroneous explanation, because the motor tyre trade is far too wide awake and long-sighted to embark upon so suicidal a proposition. Another explanation that appears to me more probable is, that the detachable rim adds weight at absolutely the worst part of the car, because not only is the rim travelling twice as fast as the rest of the car, but it is entirely uninsulated from road shocks.

A tyre is the cushion which is placed between the sledge hammer of the wheel and the anvil of the road. The detachable rim practically doubles the rim weight, or, in other words, adds something like 15 lbs. to the weight of the wheel, and this increased hammering is having its effect on the durability of the tyres. It is a little surprising, however, that detachable rims in the short time they have been on the market should have brought out this trouble so strongly as to make it a matter of Press correspondence. The case of the detachable wheel is rather different as compared with the ordinary fixed wood wheel, it reduces the weight on each tyre by about 10 lbs., and is doubtless engaged in the benevolent undertaking of

prolonging the life of the many tyres which are fitted to it. But we human beings are much more prone to cry out when we are hurt than when we are benefited; for this reason your correspondent "Nelson" writes to you.—Yours truly,

JOHN V. PUGH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, "Nelson," in the last issue of the *M.C.J.* asks, "Do tyres wear out much quicker with adjustable rims?" I presume he means detachable rims, and the obvious answer seems to me to be that it entirely depends on the kind of rim used. I have run several thousand miles on detachable rims which, as far as the fitting of tyres is concerned, do not differ in any respect from the ordinary rim used to hold any kind of standard beaded edge covers, such as Dunlops, Michelin, Continental, &c. Why should tyres, under these conditions, wear more because the rim is detachable instead of being shrunk on to the wheel as in the ordinary case? Although in use it is fixed just as securely without a possibility of moving, I can change it for another rim with tyre fully inflated in three to four minutes, and the rim itself is exactly the same as those that are usually shrunk on.

My advice to "Nelson" is not to give up using detachable rims, but to exchange those he has for others properly constructed to carry the every day tyre of commerce.—Yours truly,

MARTIN.

The Saurer Motor-Bus employed by the North Eastern Railway Company.

THE A.C.F. GRAND PRIX RACE.—Mr. W. M. Letts sends us a copy of a letter he has written to Baron Adrien de Turckheim, of the De Dietrich Company, in which he states that "It seems to me it would show a very fine spirit if the De Dietrich firm would write to the Automobile Club saying that so far as they are concerned they are willing for Mr. Edge to take part in the Grand Prix with his Napier cars on his own terms, i.e., that he shall use detachable wheels."

MR. G. DOWNARD-JACQUES, of 4, Egerton Road, St. Jude's, Plymouth, has sent us a photograph of a "sectional model" of a steam engine which he has constructed to show, among many other points, the following: The working of the piston, "Dee" and trick valves; the effect of "lap" and "leads," (+ and -) on the steam and exhaust edges of valves, and how indicator cards are affected thereby. By following a pointer fixed to the piston, running over scale (graduated) 360 divisions (degrees in a circle) all the points of the indicator card may be followed on squared paper fixed to desk in front of the cylinder, viz., lead, admission, cut off, expansion, exhaust opening, exhausting, closing and compression. By a slotted quadrant fixed to the shaft, the eccentric may be advanced or retarded to alter all these points on the card. On the shaft fixed in line with the crank pin is another pointer, working over a graduated dial (360 deg.) to correspond with scale in front of the cylinder, the idea being to show the angle of obliquity of the connecting rod when the piston is at half stroke. The necessity of giving more lead is to overcome this angle, on the outward or return stroke, as the case may be; so that the power on each side of the piston shall be nearly the same. Mr. Downard-Jacques is at present constructing a sectional model of an internal combustion engine in which he is trying to show some of the points described above, and if possible with variable cams, &c. He offers to send to any reader of the *M.C.J.* interested in the matter, photographs or drawings, with descriptions of the models, and at the same time he is open to receive any hints and suggestions on the same as specified above.

COMPANY NEWS.

MOTOR-UNION INSURANCE.—The net premium income of the Motor Union Insurance Co., which held its meeting on Tuesday, after allowing for reinsurance, amounts to £36,365. In addition there has been earned as interest and dividends upon investments the sum of £556, making a total net income of £36,922. The claims and commissions paid and outstanding on December 24th, 1907, amounted to £15,756. To meet the liabilities upon unexpired policies the directors have set aside the sum of £12,121, which they are advised is fully adequate for the purpose. Out of the available balance the directors recommend the payment of a dividend of five per cent. upon the paid-up capital, and the balance to be carried forward. The company has invested the sum of £20,000 in Trustee Securities. The first annual meeting of the company was held on Tuesday, Mr. C. H. Dodd being in the chair and congratulating the shareholders upon the fulfilment of the hopes held out in the original prospectus. He dwelt upon the various sections of the report, concluding by moving its adoption. This was seconded by Mr. W. Rees Jeffreys, who said they had been able to give a better policy than any other company, and their action had had considerable effect on the conditions of other companies. This resolution having been carried unanimously, Earl Russell was re-elected a director, and a vote of thanks to the officers concluded the proceedings.

MOTORIST v. BOROUGH COUNCIL.

IN the case of *Macnaughton v. the Holborn Borough Council*, heard on Tuesday, the plaintiff was Mrs. Tom Macnaughton, better known as Miss Alice Lloyd, who sued defendants for personal injuries and damage to her motor-car, owing to the negligence of the defendants in allowing a street lamp to remain unlit, or, alternatively, allowing a nuisance to be in the roadway. Mr. Doughty, for the plaintiff, said that she and her husband were proceeding, on a night in January, to the Trocadero. At the top of Drury Lane there was a lamp-post in the middle of the road, unlit, and plaintiff's chauffeur collided with it. A policeman had noticed the incandescent gas mantle was broken, and told the Council's foreman, who turned the light out altogether. Miss Lloyd had to be taken to the hospital, as she was badly cut on the forehead. After hearing the evidence Mr. Mackenzie, for the defendants, submitted that there was no case to go to the jury. Judge Woodfall agreed. There was no evidence that defendants were negligent, or that the foreman acted otherwise than rightly in turning out the lamp. The plaintiff must be non-suited, with costs.

ALL FOR A POUND A WEEK!

A GOOD story is told by Mr. Frank Morris, of King's Lynn. A clergyman and his wife requested Mr. Morris to provide a suitable, reliable, and thoroughly experienced driver for a new car, and it was arranged that a man should meet them on the following day at a certain place with the car, and Mr. Morris was also to be present in order to advise as to the man's capabilities for the post. On arriving at the appointed place the clergyman explained that his better half was unable to be present, but that she had a few written questions to be put to the man, and that if he was agreeable to undertake the post they would pay him £1 per week for a start.

The list was as follows:—

MOTOR DRIVER'S DUTIES.

Be at the rectory from 6.30 a.m. till seven at night.
Take entire charge of the car and clean and polish it.
Manage the pony.
Milk the cow.
Feed the chickens, pig, &c.
Clean the boots and knives.
Mow the lawn and garden.
No meals here.
Touch his hat to us.
Ride a bicycle.
Must work on Sundays, and wear decent clothes and a billycock hat.
Mr. Morris concludes sarcastically, "and the man refused the place."

MR. G. HUBERT WOODS has been appointed general manager of the Kempshall Tyre Company of Europe, Ltd., whose offices are now at Trafalgar Buildings, Northumberland Avenue, W.C.

AT the recent Amsterdam Motor Show, the Prince Consort spent some time in examining the Dunlop detachable rim, and asked that the fullest particulars should be sent to him.

In order to encourage the participation of private owners of Rover cars in hill climbing and similar competitions during the season 1908, the Rover Company, Ltd., inform us that they will undertake the "tuning up" of privately owned Rover cars entered for such competitions free of charge. They realise that many owners are deterred from entering hill climbing competitions by a feeling that their vehicles have no chance against the specially "tuned up" cars of professional drivers, and so they make this offer in order that Rover owners at least may not suffer this supposed disadvantage. They do not, of course, include free repairs in this offer.

INTERNATIONAL TOURING CAR TRIAL, 1908.

THE object of the trial is to provide a test of touring cars with a view of displaying the capabilities of the modern motor vehicle. In the new regulations just issued a departure has been made from those which have governed previous touring car trials. The advantage to be derived from the system adopted is that the successful competitors will be known as soon as the Trial is finished, since the first car in each class to pass the winning-post at Brooklands, in the 200 Miles Race which will conclude the Trial, will have won the prize in its class.

BASIS OF COMPETITION.—The Trial will take the form of a tour of not less than 2,000 miles on the road, followed by a race of not more than 200 miles on the Brooklands Track, and the basis of the competition is time lost under any of the following headings:—(a) In excess of the maximum running time allowed for each stage. (b) In advance of the minimum running time allowed for each stage. (c) In adjustments, repairs, replacements, lubrication, replenishments of oil and water, or involuntary stops, except on a hill whilst being officially timed. (d) In excess of three minutes for petrol cars and ten minutes for steam cars allowed for starting-up each morning, during which no other work may be done. (e) In excess of the one minute starting allowance after compulsory stops on the road. (f) In filling in petrol, each gallon put into the tank will be reckoned as one minute lost. (g) In climbing the timed hills. (h) In covering the required distances on the Brooklands Track, including any involuntary stops.

MINIMUM AND MAXIMUM SPEEDS.—(a) Every daily distance (except at Brooklands) shall be apportioned into stages. (b) There shall be a maximum running time fixed for every stage. (c) The time occupied by all stops shall be added to the maximum running time in order to arrive at the car's actual maximum time for the stage. (d) If the number of minutes occupied by a car in completing a stage is in excess of the car's actual maximum time for the stage, the car shall lose minutes to a number equal to the excess minutes. (e) A car which does not arrive at the end of a daily distance by 5 a.m. on the morning following shall be disqualified. (f) There shall be a minimum running time for every stage. (g) The time occupied by all stops shall be added to the minimum running time, in order to arrive at the car's actual minimum time for a stage. (h) If the number of minutes occupied by a car in completing a stage is less than the car's actual minimum time for the stage, the car shall lose a minute in respect of every minute of prior arrival. (i) If the prior arrival is due, in the opinion of the Club, to deliberate intention on the part of the driver, the car shall be disqualified. (k) Any car arriving at the end of a stage before the expiration of the car's actual minimum time shall be stopped and kept standing with the engine running till the car's actual minimum time for the stage has expired, and during this period no work may be done. (l) It is intended that the average speed implied by the minimum time for a stage shall be approximately maintained throughout a stage. Any car which may pass other cars (which are maintaining the average speed) in such a manner as to inconvenience other competitors and to necessitate the car loitering in order to prevent its arrival at the end of the stage before the expiration of the minimum time, may be disqualified.

ROUTES.—All cars in each class shall cover the same route each day. The daily road distance will not exceed about 170 miles.

DESCRIPTION OF CAR.—The cars shall conform to the requirements of the British law, shall have not less than four road wheels, and shall comply with the conditions given in the Table of Touring Car Standards published in the *M.C.J.* of November 18th, 1907.

Every entrant shall supply to the Club, not later than March 31st, 1908, on a form to be provided by the Club, a complete specification of the car or cars entered by him. Should he enter after March 31st, 1908, the specification shall accompany the entry. If the entrant be the manufacturer of such car or cars, or his authorised agent, he shall supply, not later than fourteen days prior to the start of the Trial, on a form to be provided by the Club, a signed undertaking to accept orders at the price stated for cars conforming in every respect to such specification for a period of six months from the commencement of the Trial, for delivery within a reasonable period; if the entrant be not the manufacturer then the undertaking shall be signed by the manufacturer.

PASSENGERS.—Each car must at all times carry its full complement of male passengers, or equivalent weight (see Table of Standards): provided that mechanics need not, and other passengers must not, be carried at Brooklands, but in their place ballast must be carried. In cases where ballast is taken 140 lb. shall be considered the necessary equivalent per passenger. For Brooklands (only) such ballast will be provided by the Club. Tools, luggage, fuel, oil, parts, and the like shall not be reckoned as ballast. If the mechanic be not carried at Brooklands the driver alone may do any work.

OBSERVERS.—Every competitor shall provide throughout the Trial one competent Observer per car entered by him. Every Observer shall be subject to the approval of the Club, and the competitor shall be in every way responsible for his actions, his remuneration and expense. Every entrant shall supply the Observer nominated by him with a single chronograph approved and supplied by the Club to the entrant at cost price.

REPAIRS, &c.—Except at Brooklands, no driver or mechanic, or in the case of a two-seated car, the Observer, shall be allowed to leave his seat or to make any adjustment or repair, or use any oil can, while the car is running, but the use of a pressure-feed pump, or the adjustment or manipulation of any fittings on the driver's side of the dash-

board and above the floor boards will be permissible. The gear ratio shall not be changed during the Trial under any circumstances. All parts replaced (except outer tyre covers and inner tubes) must be carried throughout the Trial, except such detachable wheels or rims as may be replaced at Brooklands, provided that stores and parts may be replaced by equivalent ballast for the purpose of the Brooklands Race, and provided that extra outer tyre covers and inner tubes, in exchange for those on the car at the start, lubricating oil, and water may be acquired during the Trial, and ignition batteries may be recharged. New batteries may be purchased en route, but all batteries must be carried on the car to the end of the Trial. It is evident from the above regulations that:—(a) During a stop for repair or adjustment any work may be carried out; (b) During the filling in of petrol, no other replenishment, repair, adjustment, uncovering or inspection of parts, may be made to the car.

FUEL CONSUMPTION.—One minute will be accounted as lost in respect of every gallon filled into the petrol tank of the car throughout the Road Trial. The fuel taken on board at Brooklands before the race (and during the race) will also be taken into account, i.e., one minute per gallon. No vehicle shall carry fuel or water, other than that contained in the tanks, except the remainder of a tin of fuel partially used, and which remainder shall be emptied into the tank before the Observer leaves the car in the evening, and one two-gallon tin of fuel bearing the seal of the Club, which shall be used only in cases of emergency, and which shall be supplied to each car. Such spare tins must be emptied into the tank at the termination of the Road Trial.

ENGINE STARTING ALLOWANCE.—An allowance of three minutes for petrol cars and ten minutes for steam cars for starting up at the depot each morning will be given. No further starting allowance will be made during the day except one minute for re-starting after all compulsory stops. During this time allowance no lubrication, repair or adjustment, or any operation other than the following is to take place:—Petrol cars—turning on petrol tap, pumping up pressure feed, flooding the carburettor, actuating the half-compression device, switching on the current, turning the starting handle, operating self-starters (no petrol or paraffin to be injected into the cylinder heads); Steam cars—turning on the fuel, pumping up pressure, lighting the pilot light, pricking vaporiser nozzle, turning on the main burner, opening and closing blow-off cock, starting and reversing engine.

BRAKE ADJUSTMENT ALLOWANCE.—A total of five minutes will be the allowance each day without penalty for adjustment of brakes, as and when desired by the driver or when required by the Observer.

TYRE DELAYS.—Delays due to tyres will be counted both on the road and on the track. In view of the importance of devices to allow of the rapid change of tyres, detachable wheels and rims will be permitted, and tyres may be fitted to spare rims and wheels outside of running time, but under observation; provided that such wheels and rims are carried on the car throughout the Trial except at Brooklands. At Brooklands tyres, detachable wheels, or detachable rims complete with tyres fitted, may be picked up or discarded by the driver at a place appointed by the Club as often as required during the Brooklands race.

The other regulations are mainly of a general character, including the finality of the Club's decisions and other matters of real interest to competitors; while in a Comment we give particulars of entrance fees and dates assigned for the receipt of the same as well as the times of the trial.

In connection with the regulations for the International Touring Car Race those for the Scottish Reliability Trial are also issued. This trial will be a portion of the 2,000 miles Trial, but remains, notwithstanding, a separate and independent event. Competitors in the 2,000 miles Trial desiring to compete in the Scottish trial must separately enter for the latter, and during the period of the Scottish Trial will be observed under the rules and conditions of both. The entries for both trials will open and close simultaneously. The Scottish Trial is open for entry, apart from the 2,000 Miles Trial, to vehicles taking no part in the longer Trial.

While all vehicles covering the ground of the Scottish Reliability Trial shall be under the control and jurisdiction of the Scottish Automobile Club, only those specially entered for the Scottish Trial will be eligible for the awards and certificates of the Scottish Club. Not more than 500 miles of the 2,000 Miles Trial will be covered before the commencement of the Scottish Trial.

The proposed Trial is largely on the same lines as those so successfully carried out during the past three years. The minimum times will be fixed with due regard to the legal limit of speed, while the maximum time will be determined with some regard to the nature of the roads and the towns and villages to be traversed, and to the reasonable requirements of the buying public in the matter of speed of cars. The Trial will comprise about 750 miles of road and detachable wheels and rims will be permitted. There will be a maximum number of marks for the run, and marks will be deducted for every minute or part of a minute during which the vehicle is at rest from the time of starting to the conclusion of the run (except for tyre troubles, which are separately dealt with, or as otherwise provided for, on the following basis:—(a) For each stop not exceeding five—two marks for every minute or part of a minute. (b) For each stop exceeding five minutes and not exceeding fifteen minutes—ten marks for the first five minutes, and three marks for each succeeding minute or part of a minute. (c) For each stop exceeding fifteen minutes—forty-five marks for the first fifteen minutes, and four marks for each succeeding minute. Where two or more stops from a like or similar cause take place within short intervals the Committee reserve power to determine that such shall be reckoned as one stop under above rule.

GARAGES AND MOTOR HOUSES.*

BY C. HARRISON TOWNSEND.

It is a commonplace that an architect's first consideration should be to provide himself with the data of his problem. Dealing as we are with the home of an automobile, the length, breadth and height of this are the all-determining factors. Here we are in a not very assured state of certainty. The height of car, and the breadth of wheel-base, chassis and body have, indeed, shown little change since the early days of their manufacture, and do not, in most makes, differ very widely. As regards the length, however, matters are not so simple, and two things have to be considered. In the first place, it is, undoubtedly, the tendency of the man who invests in his first car (for the first is never the last) to "begin small," and to be satisfied with one which is less expensive and smaller than its successor; and, secondly, the disposition on the part of makers has been, year by year, towards increased length. Indeed, I know of one garage where the lift has had to be lengthened (not widened, though) twice already in a few years since the place was built. The following table, prepared by one of the largest manufacturers, gives the dimensions for the different kinds of vehicles of their make:—

Type.	Wheel Base. Ft. in.	Length. Ft. in.	Width. Ft. in.	Height. Ft. in.
14-16-h.p. Side entrance	8 4	12 6	5 2	5 3
" Side entrance with hood up ..	8 4	12 6	5 2	7 5
" Side entrance with hood folded ..	8 4	12 6	5 2	5 6
" Single landaulet	9 0	13 0	5 2	7 0
" Limousine	9 0	13 0	5 2	7 0
" City carriage	6 10	10 8	5 6	7 4
16-20-h.p. Side entrance	9 0	13 0	5 3	5 5
" Side entrance with hood up ..	9 0	13 0	5 3	7 7
" Side entrance with hood folded ..	9 0	13 0	5 3	5 8
" Seven-seater side entrance ..	9 9	14 10	5 8	5 6
" Three-quarter landaulet ..	9 9	13 10	5 8	7 7
" Limousine	9 9	13 10	5 8	7 7
26-30-h.p. Side entrance	9 3	13 4	5 7	5 5
" Side entrance with hood up ..	9 3	13 4	5 7	7 7
" Side entrance with hood folded ..	9 3	13 4	5 7	5 8
" Three-quarter landaulet ..	10 0	14 1	5 7	7 8
" Limousine	10 0	14 1	5 7	7 8
40-h.p. Side entrance	9 8	13 8	6 0	5 6
" Side entrance with hood up ..	9 8	13 8	6 0	7 8
" Side entrance with hood folded ..	9 8	13 8	6 0	5 9
" Seven-seater with side entrance ..	10 4	14 4	6 0	5 6
" Three-quarter landaulet ..	10 4	14 4	6 0	7 8
" Limousine	10 4	14 4	6 0	7 8

N.B.—In some cases the head-lamps mean a further increase in length.

For giving the car proper attention space should be arranged between it and the walls at each side and at each end. This should be at least 2 ft. 6 in. where a pit is provided, but if the latter does not exist, and the car is raised for underwork, the space should be 3 ft. or 3 ft. 3 in. In the case of several cars standing side by side, there need only be 2 ft. 6 in. or 3 ft. between them. So far, then, we have reached the internal size of a one-car house 16 ft. + 2 ft. 6 in. or 3 ft. 3 in. + 2 ft. 6 in. or 3 ft. 3 in. = 21 ft. or 22 ft. 6 in. for the length, and 6 ft. + 2 ft. 6 in. or 3 ft. 3 in. + 2 ft. 6 in. or 3 ft. 3 in. = 11 ft. or 12 ft. 6 in. as the width.

The height of the doors should be sufficient to pass in a car with the hood up, plus its luggage-rail, and, possibly, tyres on the roof, or, say, 9 ft. They should be at least 8 ft. wide in the clear, and may be either steel revolving shutters or they may be hinged—opening outwards, of course—and preferably under a pent-roof. Finally, sliding doors may be employed—sometimes the most difficult arrangement to provide for.

For the motor-house for one or two cars not much height is required to the roof-plate, and 8 ft. will be found a good minimum to start from.

The walls should either be faced—at all events, to a height of about 4 ft. from the ground—with glazed bricks, or lined with tiles. They should have a coved brick or tile at their junction with the floor, to avoid the harbouring of grease and dirt. All angles to recesses—such as that for the hydrant of the radiators—should be rounded, and there should be as few projecting features as possible. Just above the floor-level in each external wall should be inserted air-gratings. They should, where possible, be placed behind the small radiators.

In the larger number of garages cement is laid to a smooth finish and to falls. I do not, however, think this a very efficient material. The action of the dropped oil on its surface tends to rot and "take the virtue" out of the cement, and granolithic distinctly offers less opportunity for this. Stone flags, laid not on a concrete bed but on sleeper walls for the advantage of the air space beneath thus obtained, seem to add still further to the risk of the dangerous sparks that may result from the car coming in or going out with a chain or stud anti-skid appliance fixed on the tyres. Again, unless the space beneath is of considerable size—a cellar, in fact—there would be the danger of its forming a chamber where explosive gas could collect as the result of leakage.

The drains should not be underground pipes, but open, half-round channels.

In cases where it is incumbent to make use of the pit, the best size for

this is 6 ft. by 3 ft. by 4 ft. 6 in. or 4 ft. 9 in. deep. Its sides should be lined either with glazed bricks or tiles, and it will be found convenient to form in them a recess on each side in which the chauffeur when at work can place his tools from time to time. Iron ring steps afford access to it. An American expert strongly advocates the extension of the pit beyond the outer wall of the garage, as tending towards a certain amount of ventilation at all events, and as giving means of escape for the chauffeur, who would otherwise be shut up in a trap in case of fire. It will be found well to lay on the floor coarse sand, which should be constantly removed when impregnated and foul, and of course the proprietor will see to a liberal provision of drip-pans.

It is not of great use placing a skylight above the pit, since the car, when standing over the latter, naturally blocks out the light. A long bow window quite near the floor is a better arrangement by far, and can be made also to help in the ventilation so desirable.

A garage should be of fire-proof construction, the roof no less than its other portions.

Exterior to the motor house proper a covered washing place should be provided, to allow of a thorough washing down, whatever the weather may be.

The petrol store is a highly important feature of the garage. In case of a small garage petrol would be kept in 2-gallon cans, the store of which should, wherever possible, be at least 20 ft. away from any other building, and should be of fireproof materials, with iron door and its walls provided with ventilators having gauze protection. The floor of concrete, coated with cement, should be sunk below the ground level, and the door should have a raised sill. This sunk space is filled with sand. The cans should be close to the doors in order that they may be easily accessible, and that the chauffeur need never stand inside.

It is of importance that there should be no risk of the temperature of the motor house falling to freezing point. As regards, however, the heating and consequent drying of the atmosphere of the motor-house, there are two conflicting claims to be satisfied. Expert carriage builders plead on behalf of the painted body and wheels for a house "which cannot be too dry"; while Dr. C. O. Weber, the authority as far as rubber is concerned, states that tyres are likely to "keep distinctly better in a damp than a dry room." Keeping a balance between these two claims we find that the motor-house is best when dry but not unduly so. Its temperature should be about 60 deg. F. The heating apparatus, of course, should have no opening from the motor-house, but be arranged with external access, and a low pressure system with radiators will be found the best. These may be placed as found advisable, but in a garage of any size there will be a considerable advantage if a cupboard be provided containing a small radiator, to be made use of when drying rugs or cushions, and with ventilation to allow the escape of the resultant steam.

Provision against fire should be attained by means of hydrants and chemical extinguishers.

The day-time lighting should be effected by windows which do not admit south sun, and if by skylights, these should have the usual studio northern aspect. The Dunlop firm, by the way, recommend as the best light for the tyre-store the same yellow light as photographers prefer.

For artificial light there is none obviously that can compare with an electric system. This, however, is not always available, and in that case when either gas or oil is employed the lamps should be on the outside of the windows, through which their light plays into the inside of the house.

Some of the rain-water may well be gathered either into a butt or tank, and will be found valuable for washing purposes.

The storage place for tyres, testing apparatus, pumps, and spares generally should be distinct from that in which cloths, cleaning oil, brushes, waste, &c., are kept on metal-covered shelves, and with proper ventilation. There should be rack or shelf accommodation for rugs, extra cushions, and the like.

The workshop is a feature as to which the owner of the car always has his own views. He may merely wish to have simple repairs carried out there, or he may be himself, or else employ as chauffeur, a skilful engineer whose pride is that the car need never go back to its maker in case of mishap and consequent repair. In the latter instance, a lathe, a drilling machine, a forge—perhaps an anvil—would be asked for, and if heavy parts have to be dealt with, a portable crane, or a differential hoist would be found of much use. Of course, when forge or blow-pipe work is done, it should not be in any part of the building directly accessible from the motor-house itself. In any case, a full-size work-bench will be needed, so placed in front of a window as to be well-lighted, and provided with a good vice, preferably of the swivel type. Proper drawers, shelves, and tool racks must be arranged for.

The principles and conditions which obtain with regard to the smaller home of the automobile are, in the main, applicable to the larger and generally public motor-house generally called the garage. A garage may be built for one of two purposes. It may be meant for some special use, such as housing a number of motor-cabs or omnibuses belonging to one particular company or proprietor, or it may be meant to receive and house cars of various descriptions and sizes placed there for a longer or shorter time by their owners. In the former case, what has to be kept in view—and with motor-omnibuses especially—is the fact that the vehicles come in and go out in some special rotation or order, and that the earliest to leave in the morning should have facilities for being so stabled that in order to do so they disturb as few as possible of those placed in front of them.

* From a paper read at a meeting of the Architectural Association, February 7th, 1908.

THE MANCHESTER MOTOR SHOW.

THE fifth motor show organised by the Manchester Motor Trade Association was opened in St James's Hall, Oxford Street, Manchester, on Friday, last week, by the Lord Mayor of the city, Mr. Alderman Holt. The show has been extremely well supported by the trade, every inch of space being occupied, reflecting the greatly increased interest which is being taken in the automobile in the North of England.

Briefly reviewing the car exhibits, we may mention that the Holling-drake Automobile Company, Ltd., Stockport, display both the Talbot and

The Motor of the Maja 28-35-h.p. Four-Cylinder Car.

La Buire models, two sizes of each being on view. Messrs. S. F. Edge, Ltd.'s, exhibit comprises three six-cylinder Napier cars, two of 40-h.p. and one of 60-h.p., the latter being fitted with the Rudge Whitworth detachable wire wheels. The major portion of Messrs. Jarrott and Lettis' stand is devoted to Crossley vehicles, the exhibit comprising a 40-h.p. live axle chassis and a 40-h.p. limousine. A 9-h.p. Sizaire-Naudin two-seated car is also to be seen. The exhibit of Argylls Manchester, Ltd., includes the new 40-h.p. vehicle, a 16-20-h.p. three-quarter landaulet, a 14-16-h.p. touring car and a 14-16-h.p. doctor's car arranged to be driven from the inside. Three cars are staged by the Daimler Motor Company, Ltd., two being of 42-h.p. and one of 30-h.p. The latter is the new live axle model, while of the former one is fitted with an "Aston" landaulet body. Mr. A. E. Crowdy presides at the stand of the Wolseley Tool and Motor Car Company, Ltd., where the chassis of the 14-h.p. Wolseley-Siddeley vehicle is attracting attention. Two examples of the 18-h.p. car as well as a 30-h.p. limousine are also on view. Examples of both the Beeston and Coventry Humber cars are to be seen at the stand of Messrs. Humber, Ltd., prominent among them being a 30-h.p. six-cylinder vehicle from the Coventry factory. An extensive display of the well-known Star cars is made by Messrs. J. G. Looker and Co., Manchester, the district agents for the Star Engineering Company. The models on view include a 30-40-h.p. six-cylinder live-axle car with a side entrance double phaeton body, a 30-h.p. four-cylinder chain-driven chassis, a 16-20-h.p. touring car, a 12-14-h.p. touring car, and a 9-h.p. two-cylinder two-seated vehicle. The Star cars are all fitted with ball-bearings throughout, except the engine, and have earned an excellent reputation for reliability.

One of the largest stands is that of Messrs. Joseph Cockshoot and Co., who are showing Renault, Rolls-Royce, Austin and the new Maja cars. The latter vehicles are the production of the Austrian branch of the Daimler Motoren Gesellschaft. We give an illustration of the engine of the 28-35-h.p. car herewith. As will be seen, it comprises four cylinders, 110 mm. by 130 mm., cast in pairs. Ignition is by low-tension magneto, simplification being introduced by working the make-and-breaks from a single vertical shaft, having a cam at the top controlling two horizontal spindles in either direction. Another new feature is the lubrication, in which all springs are avoided, the pump being worked through a small cardan shaft from the half-time shaft. Four speeds forward and a reverse are provided, with direct drive on top speed. Belsize Motors, Ltd., in addition to a 20-h.p. car and a 28-h.p. vehicle, have on view a 14-16-h.p. four-cylinder machine, this being a new model for the 1908 season. The four-cylinder engine has a bore of 3½ in. by 4 in. stroke. The three-speed gear-box is "gate" controlled and the final transmission, as in all Belsize cars, is by cardan shaft and bevel gear to a live axle. Motors and Repairs of the Harrington Garage, London, S.W., show for the first time the M.P. 30-h.p. car; this is fitted with a Barriquand and Marre four-cylinder engine, 112 mm. bore by 140 mm. stroke. The transmission is through a Hele-Shaw clutch, gate-controlled four-speed gear-box and cardan shaft to a live axle.

The Swift cars displayed by Halley's Motors, Manchester, Ltd., include examples of the 10-12-h.p. and 18-24-h.p. models. At this stand is also to be seen a 12-16-h.p. Vauxhall. Mr. F. Wilkinson, in addition to a couple of the Stanley steam cars, illustrated and described

in a recent issue, is showing a chassis of the 20-h.p. Valveless car. Fiat Motors, Ltd., are present with examples of the 15-20-h.p. and 28-35-h.p. models of these well-known vehicles. Mr. T. Garner, Manchester, shows the Singer, B.S.A., and Darracq vehicles, and Messrs. J. Fraser, Hay and Co., of the Great Central Motor Garage, Manchester, a 12-16-h.p. Thames landaulet, of the type recently illustrated in the *M.C.J.*; the Ariel cars on view include a 25-30-h.p. chassis, a 30-40-h.p. touring car, and the new 20-h.p. brougham; the White Company show through their Manchester branch examples of both the 20-h.p. and 30-h.p. White steam cars; while the Vulcan cars are displayed by Mr. H. H. Timberlake, Wigan. Other cars on view include the Sunbeam, Rover, Scat, Aries, West-Aster, Lanchester, Rothwell, Bell, Mercedes, Deasy, Ford, Dennis, Alldays, Riley, and Motobloc.

In the accessory section, Messrs. Brown Bros. have a big display of "Duco" specialties as well as Renold and Brampton motor chains, H.F. vulcanisers, Stepney spare wheels, Larrad's motor-timer, E.I.C. ignition devices, and Continental, Clincher and Dunlop motor tyres, &c. The Manchester Motor Supply Company have a large range of accessories, prominent among which are the Imperial Odometer and the Phœbus projector lamp. Oils and lubricants are shown by Price's Patent Candle Company, Ltd., Messrs. Marshall and Co., Ltd., Mossley, Messrs. John S. Morris and Son, Salford, and the Auto-Lubrine Company. Biley's Motor Microscope Company, Salford, exhibit a new device known as a miloscope, which shows the speed of the car in miles per hour at a glance, and indicates the total mileage. They also display a useful arrangement for carrying spare tyres or wheels, an improved lubricator, and an air compressor for use in garages. Messrs. Finnigans, Ltd., have a big display of motor trunks and other touring adjuncts. The exhibit of the County Chemical Co., Ltd., includes the G.B. and Chemico tyre vulcanisers, carbide, lubricants, &c. Motor carbide solution, &c., as well as the new electric tyre vulcanizer are to be seen at the stand of the Union Rubber and Chemical Co., Ltd.; while Mr. J. Leadbitter-Smith demonstrates the merits of the Ara method of tyre vulcanisation. Pettett's Patent Safety Filler Company, Brighton, are present with their ingenious and useful safety filler for transferring petrol from the tins to the car tank.

The tyre exhibits include the Dunlop, Moseley, Continental Shrewsbury and Challiner, Elastes, Michelin and Collier. The ingenious Palmer cord-laying machine, which caused such a sensation at last year's Cordingley Motor Show, is shown in operation by the Palmer Tyre Company, Ltd. The cords as laid by this machine are, of course, of even tension throughout, which accounts for the immense strength and durability of Palmer Cord tyres. The Midland Rubber Company, Ltd., show the Midland motor tyres and Ajax detachable rim. Messrs. C. Macintosh and Co., in addition to the Macintosh motor tyres, include the new Kempshall non-skid tyre in their exhibit. Non-skids are also shown by Mr. W. S. Cort, Market Harborough.

Messrs. J. Frankenburg and Sons, Ltd., Salford, have a novelty in Frankon filling for motor tyres. This is an elastic material which can

An Episode of the Manchester Show.—A Sizaire-Naudin single-cylinder car scaling Junction Street with four passengers up. The steepness of the gradient is well shown in the illustration.

be injected into the inner tube in place of air after the tyre has been fixed on the rim. A novel tyre, designed to give all the advantages of the pneumatic without any of the drawbacks of the latter, is the Slea, made by the Slea Tyre and Wheel Company, Ltd., 15, High Street, Manchester. The tyre is of a special design of arched solid rubber, and is so arranged that all circumferential and lateral movement is prevented. A new detachable motor rim is the Seddon, made by Seddon's Duplex Detachable Motor Rim Company, of 29, Brown Street, Manchester. The arrangement is such that not only can the tyre and rim be readily removed from the wheel, but the cover can be taken off the rim without the use of levers. The show closes to-day (Saturday).

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE number of candidates elected to membership of the R.A.C. at the monthly meetings in January and February of this year is much greater than the number of candidates elected last year during the same period.

The first meeting of the General Committee, formed under the Club's scheme for association, and which is composed of delegates of the Club and bodies associated therewith, will be held on Wednesday next.

For the new committee of the Royal A.C., Mr. T. G. Chambers does not intend to offer himself for re-election. New candidates, other than retiring members of the committee, are Messrs. S. F. Edge, J. C. H. Grant, C. K. Gregson, E. Shrapnell Smith and H. W. Staner. Thursday next is the last day for the receipt of nominations.

At the last meeting of the Committee, Capt. Dyke Acland drew attention to the proposition of a motor firm that the Club should observe a 15,000 miles trial of regularity, efficiency, economy, and endurance. The firm proposed to challenge any car or cars which might compete in Class 9 in the international touring car trial of the Club. Capt. Acland informed the Committee that the Competitions Committee was strongly in favour of such a trial from a sporting point of view, and that Capt. R. K. Bagnall-Wild and himself, on their behalf, had amended and approved the conditions for the trial in consultation with the firm. The international touring car trial of 2,000 miles would form part of this 15,000 miles trial, and the records of the 2,000 miles trial were to be accepted

developed with the same energy which pervades Lancashire, Cheshire and Yorkshire.

LINCOLNSHIRE MOTOR CYCLE CLUB.

It has been decided to ask Earl Brownlow to be president of the Lincolnshire Motor Cycle Club, of which Mr. G. J. Wilkinson is the enthusiastic hon. secretary. A hill climb is among the fixtures for the year. This will take place on Easter Monday near Lincoln.

Various centres are being formed so that the organisation may thoroughly cover the county, those at Grimsby and Grantham having had a most successful year; others are in contemplation for Louth and Scunthorpe. In connection with the club, an official organ is being promoted, the first number of which indicates originality and ability on the part of the editor.

LADIES.

On Wednesday, January 29th, and again on Wednesday of last week, Mr. R. Sedgwick Currie, club engineer, gave at the club his first two technical lessons on the internal combustion engine. These lessons were very well attended some twenty-five members being present each day. The first lesson was a concise description of the history and working of the Otto cycle engine—a two-cylinder engine being pulled down so as to thoroughly demonstrate the principle. At the second lesson a very detailed description of every part used to build up the engine was given, and also many particulars of the methods of manu-

The above illustration depicts a batch of 10-12-h.p. Coventry-Humber Cars being tested before being fitted with finished bodies.

The cars as they come from the factory are all tested on a hill about 1 in 16, which must be taken on top gear. At the least sign of a falter the vehicle goes back to be further tuned. [Campbell-Gray.]

by the entrants. The Committee of the Club unanimously approved of the view taken by the Competitions Committee, and endorsed its action.

New members of the Royal A.C. include the Marquis of Lansdowne, Lord Dunleath, Lord Hethfield, Lord Crawshaw, the Hon. Gerald Montagu, Mr. T. B. Morison, K.C., and Mr. C. N. Nicholson, M.P.

THE AUTOMOBILE ASSOCIATION.

THE fact that a small army of yellow armed cyclist patrols is now doing duty in Lancashire and Yorkshire does much to familiarise the northern motorist with the work of the Association, and he and his friends have signified their approval in the usual manner, namely, by joining in large numbers. Lord Tollemache is among the new members.

The Northern Patrol Committee, composed of leading local motorists, is doing good work, and the presence in Manchester of two members of the executive committee—Mr. Charles Jarrott and Mr. D'Arcy Baker—has enabled these gentlemen to attend a meeting of the Northern Patrol Committee, Mr. Councillor Kay, J.P., (Chairman) and Messrs. John Newton, H. Hollingdrake, Lawton Goodman, Alfred Thompson, Gerald Dugdale, and Walter Cawood. Mr. Stenson Cooke, Secretary of the Automobile Association, is making a long stay in Manchester, from which city several tours of inspection have been made on the roads now patrolled by the Automobile Association's cyclists. These extended as far as Carlisle, where the secretary drove on Sunday last from Manchester, meeting at luncheon several members of the proposed Scotch Patrol Committee, who had motored specially from Glasgow for this purpose. Scotland is being

facturing same. At both lessons a large number of interesting parts were shown, which had been placed at the disposal of the club by the kindness of Messrs. Aster, Ltd., Renault Freres, and the Itala Automobiles, Ltd.

On the 4th inst., the fifth annual general meeting of the members was held. The following ladies were elected to serve on the committee:—The Duchess of Beaufort, Lady Brassey, Hon. Mrs. Eric Chaplin, Muriel Countess De La Warr, Lady Viola Gore, and the Countess of Lathom. It has been decided to limit the membership of the club to 425; at the present time there are 394 members.

BRADFORD.

THE third annual dinner of the Bradford Automobile Club was held last week at the Great Northern Victoria Hotel. Mr. Tom Mitchell (president of the club) presided, and the company present included the Lord Mayor (Mr. J. E. Fawcett), Mr. David Wade, Alderman W. C. Lupton, Mr. Amos Crabtree, Mr. G. Kent (chairman of committee), Mr. E. H. Hepper (president of the Yorkshire Automobile Club), and Mr. J. Scriven (hon. secretary Bradford A.C.).

In giving the toast of "The Lord and Lady Mayoress and the city of Bradford," the President regretted that the Lord Mayor was not a motorist. He regarded him as a much-worked official and suggested that the remedy for this state of affairs was to be found in the purchase of a car. By this means the Lord Mayor would be able to save two hours a day.

In responding to the toast, the Lord Mayor expressed his pleasure that Bradford was so favourable to motoring. Seldom was it that any

of them came before the justices, and he was very glad to say that they did not possess those beastly traps, for those are, they would all agree, a very mean way of trying to catch people. It did not strike him as being at all satisfactory.

Dr. Veale presented the toast of "The Yorkshire Automobile Club." In responding, Mr. Hepper referred to the Lights on Vehicles Act, and expressed the opinion that it did not go far enough, for whilst white lights in front were certainly useful, what was wanted on every vehicle was a rear red light. He hoped that the various authorities throughout the country would pass bye-laws to that effect. Discussing the question of possible legislation, he said that motorists would not object to the payment of taxes if only the money were applied for the benefit of the public as well as themselves. The Yorkshire Automobile Club had done much to encourage considerate driving.

Other toasts included "The Automobile Association," proposed by Mr. Amos Crabtree and responded to by Mr. Stenson Cooke, and "Our Guests," given by Alderman W. C. Lupton.

THE CRYSTAL PALACE.

MORE than 140 members and friends of this Club (many ladies being amongst the number), patronized the Bohemian concert held at the Crystal Palace on Wednesday of last week. A happy combination was effected by Mr. J. van Hooydonk giving a lantern lecture between the two portions of a very enjoyable programme of musical items. Mr. Hooydonk recalled, by his photographs, many happenings of summertime on the road and track, his snap-shots of racing subjects at Canning Town and Brooklands being much enjoyed, as were his portraits of famous men and historic cars, dating back to the "Red Flag" days of 1895.

NORTH YORKSHIRE.

AT the annual meeting of the North Yorkshire A.C., held at the office of Mr. Francis Ware, hon. secretary, 6, New Street, York, it was reported that the East Riding County Surveyor had agreed to have a motor warning post erected at a dangerous corner of the road from Weston to Kirkham Abbey.

Lord Delamare mentioned that the East Riding County Council would probably be prepared to pay one third of the cost of the improvement of the corner at Staxton, whereupon the club decided to contribute another third of the amount.

The annual dinner of the club will be held at the Station Hotel, York, on the 23rd inst.

BARNSELY.

THE present membership of the Barnsley and District A.C. is thirty-eight, and at the annual meeting just held, with the Rev. T. T. Taylor in the chair, it was decided that monthly meetings should be held during the coming season. The club has resolved to affiliate with the Motor Union, and officers for 1908 have been elected as follows:—President, Rev. T. T. Taylor; vice-presidents, Mr. E. G. Lancaster and Dr. F. Sadler; hon. treasurer, Mr. J. Carrington; hon. secretary, Mr. Henry J. Wells; representatives on the General Committee of the Motor Union, Major Chas. Fox and the hon. secretary.

CYCLE AND TRADES BENEVOLENT FUND.

AT the first meeting of the new executive of this fund, held on Wednesday of last week, Mr. Albert Brown presided, when fifty-six subscribers, twelve members, and one life member were elected. It was decided that the boundary of the Midland Centre should comprise the counties of Warwickshire, Worcestershire, and Staffordshire, and instructions were given to the organising committee to cover the London centre by division into postal districts. It was agreed that Mr. Albert Brown should be recognized as the subscribers' representative. Several applications for relief were dealt with, assistance being granted in most cases. Mr. A. J. Wilson, of 154, Clerkenwell Road, E.C., is the hon. secretary.

THE SCOTTISH MOTOR TRADE ASSOCIATION, LIMITED.

The following officers of this association have been elected for 1908:—President, Mr. Thomas Shaw, Dundee. Vice-President, Mr. W. L. Sleigh, Edinburgh. Council, Messrs. A. C. Penman (Dumfries), J. H. Paterson (Aberdeen), Jas. Gibbon (Glasgow), A. G. Rennie (Glasgow), Wm. McLean (Glasgow), and John Love (Kirkcaldy). Representing associate members, Mr. Thomas Campbell, Glasgow, and Mr. Wm. Rutherford, Edinburgh. Solicitors, Messrs. Henderson and Mackenzie, S.S.C. Auditor, Mr. W. D. Stewart, C.A., Edinburgh. Hon. secretary and treasurer, Mr. David A. Fairley, C.A., 13, York Place, Edinburgh. Registered Office, 23, Rutland Square, Edinburgh.

THE Newcastle and District Motor Cycle Club has held its second annual dinner.

THE North Islington Conservative and Unionist Motor Club has been formed, with offices at 623, Holloway Road, N.

THE annual dinner of the Derby and District A.C. will be held on the 20th inst., with Mr. F. A. Bolton, J.P., in the chair.

ROAD REPORTS.

CRAWLEY AND IFIELD.—The West Sussex County Council have applied to the Local Government Board to put in force over certain portions of the main road at Crawley and Ifield the regulations authorised by the Motor Car Act, 1903, limiting the speed of cars to ten miles an hour. Objections to the making of the regulation asked for may be sent to the Local Government Board on or before February 27th, and copies should also be sent to the Clerk to the County Council.

ELTHAM.—Signs and posts are being erected at the London end of Eltham indicating the proper road to Folkestone. Similar notifications have also been set up at the cross roads at the further end of the district. Motorists who have hitherto suffered confusion when in the district will appreciate this thoughtfulness on the part of the Woolwich Borough Council.

MORAYSHIRE.—As directed by the Road Board of Elginshire, Mr. Alexander Hogg, County Road Surveyor, has drawn up a series of reports as to the damage caused to county roads by motor-car traffic. One of the alternatives before the Board is to widen and strengthen the roads most frequented by motorists. The surveyor estimates that the total expenditure would amount to the practically prohibitive sum of £79,085, made up of £20,325 on principal main roads, £52,660 on second class main roads, and £6,100 on loop roads.

CHIPPING SUDBURY.—The Surveyor of the Chipping Sudbury Rural Council has been instructed to prepare a list of places in that area where he would recommend the restriction of motor-car speed.

CADDER.—The Cadder (near Glasgow) Parish Council is seeking to secure a reduction of the speed allowed for motor-cars within their area to ten miles per hour.

The Garage at the Fiat Company's new Repair Works at Wembley.

MIDLOTHIAN.—The Suburban District Committee of Midlothian County Council has decided to request the County Council to make application to the Secretary for Scotland to issue orders restricting the speed of motor-cars to ten miles per hour on numerous pieces of road within populous places in the district.

BARNES.—It was stated at the meeting of the Surrey County Council on Tuesday that the L.G.B. has issued orders restricting the speed of motor-cars to ten miles an hour in certain thoroughfares in Barnes and East Molesey.

SLOUGH.—The Bucks County Council have decided to apply to the L.G.B. for a speed-limit of ten miles an hour for motor-cars passing through Slough, and the matter came before the Slough Urban Council on Tuesday, when Councillor Pike said that ten miles an hour was only a little over walking pace. The Council decided to support the Bucks County Council in their application for the limit of ten miles an hour.

THE 1907 diary of the six-cylinder Napier car comes to hand with a series of illustrated records of the events won last year by the vehicles with which the name of Mr. S. F. Edge is indissolubly associated.

THE Exors. of H. A. Hamshaw, of 37, Humberstone Gate, Leicester, inform us that the appointment which they have held for a number of years as coach builder to His Majesty, and which in due course lapsed upon the death of the late Mr. H. A. Hamshaw, has now been renewed. The firm have entirely rebuilt and greatly enlarged their works to enable them to cope with the growing business in high-class motor carriage work, and have laid down increased plant to deal in an efficient way with motor chassis and motor repairing, which is now an important part of their business.

FORTHCOMING EVENTS.

FEBRUARY.

- 19th (W.).—Annual dinner of the Cardiff M.C.
 20th (Th.).—Meeting of the Essex M.C.
 First annual dinner of the St. Albans and District Motor Cycle Club at the George Hotel, St. Albans.
 21st (F.)—29th (Sat.).—Manchester Motor-Car Show at Belle Vue.
 24th (M.).—Motor Show opens at Bcmabay.
 26th (W.).—Prof. H. S. Hele-Shaw and Mr. Douglas Mackenzie will read a paper on the "Problem of Road Construction" before the Society of Arts.
 27th (Th.).—Mr. Mervyn O'Gorman at the R.A.C. on "Gear Transmission."

MARCH.

- 5th (Th.).—Paper by Dr. W. Watson at the R.A.C.
 11th (W.).—Annual meeting of the Incorporated Institution of Automobile Engineers.
 11th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 12th (Th.).—Annual meeting of the Royal A.C.
 Annual dinner of the Royal A.C. at the Covent Garden Theatre.
 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 19th (Th.).—Monthly meeting of the General Committee of the Motor Union.
 21st (Saturday)—28th (S.).—
 CORDINGLEY'S THIRTEENTH INTERNATIONAL MOTOR-CAR EXHIBITION will be held at the Royal Agricultural Hall, London.
 31st (Tu.).—Last day for receiving entries, at ordinary fees, for the International Touring Car Race.

APRIL.

- 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.

MAY.

- 1st (F.).—The Frome's Hill Climb of the Herefordshire A.C.—provisional.
 10th (Sun.).—Targa Florio Race.
 11 (M.)—16 (S.).—Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

- 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 15th—19th.—Scottish Reliability Trial.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.

LIGHTING-UP TIMES—LONDON.

Feb. 15th—6.9	17th—6.14	19th—6.18	21st—6.22
16th—6.12	18th—6.16	20th—6.19	22nd—6.24

THE STORAGE OF PETROL.

DR. C. S. WELLES, of Old Brompton Road, S.W., was summoned at the West London Court, at the instance of the London County Council, for storing petrol in a storehouse which was used as a dwelling-house. Mr. Greenwood, who prosecuted, stated that on January 7th there were found in the defendant's garage twenty-one vessels containing two gallons each of petrol. The defendant said he understood that he was allowed to keep in his motor-cars such petrol as he required for them, and, as the cars had been sent away to be repaired, he was keeping the petrol tanks in the garage. The magistrate imposed a fine of 40s., with 21s. costs.

MESSRS. CHAS. JARROTT AND J. W. STOCKS both used "Shell" motor spirit when making their records on the Brooklands Motor Track last week.

"THE Cost of Running a Motor-car" is the title of an interesting pamphlet issued by the London and Paris Exchange, Ltd., motor agency, 55 to 59, Shaftesbury Avenue, W., in which are recorded the actual expenses incurred in running several types of petrol and steam vehicles.

MR. R. W. A. BREWER and Mr. F. Hastings Medhurst have entered into partnership, with offices at 13, Victoria Street, Westminster, S.W.

MESSRS. G. F. HEATH AND CO., 49, John Bright Street, Birmingham, have been accorded permission by the licensing authorities to place three Darracq motor-cabs on the streets of Birmingham to ply for public hire. They also propose to have a motor-van in the city for a week or so, which they will place at the disposal of any firms interested.

MESSRS. WELTE AND OWENS, LTD., 16-20, Colquitt Street, Liverpool, have been appointed retail representatives for H.F. vulcanisers for the district of Liverpool, and are now extending their premises in order to show a stock of the appliances and give demonstrations of the H.F. process.

POLICE TRAPS.

SHOOTER'S HILL ROAD is again the scene of police trapping—a fact of importance to motorists in the Woolwich, Blackheath and Eltham districts.

THE police are extremely active in preventing an excess of the ten-mile limit in Richmond Park.

A TRAP is in operation in the London Road, Morden.

THE Eltham Road, Eltham, has a police trap in almost daily operation.

AUTOMOBILE ACCIDENT.

MR. GAVIN BRYDON was knocked down and considerably shaken in Comiston Road, Edinburgh, by a motor-van belonging to the Health Department of the city, which emerged from the hospital road as Mr. Brydon had stepped off the pavement.

BUSINESS NEWS.

THE Chief Constable of Leicester has been provided by the county with a 15-h.p. Coventry Humber for use in the discharge of his duties, and reports that he has found it quite satisfactory in every way.

FOR the convenience of tourists the Hutchinson Tyre Company has arranged a brief telegraphic code by means of which instructions can be clearly conveyed at a minimum cost. This will be specially useful to those touring on the Continent, where the cost of telegraphing is an item for consideration. The code is contained in the Hutchinson list, which will be sent post free to any address on application to 13, Maddox Street, London, W.

ALTHOUGH some people say that January was a slow month in the trade, it is noteworthy that the Stepney Motor Wheel, Ltd., report that it was a record one for business in Stepney wheels for home, foreign, and colonial trade, each of these three departments showing the best on record.

DURING January Messrs. S. F. Edge, Ltd., delivered to actual users forty-six Napier cars, all, with two or three exceptions, being six-cylinder cars of 30-h.p. and upwards.

AT 104, Park Street, Gloucester Gate, London, W., Messrs. H. J. Chapman and Co., Ltd., have a garage for fifty cars, and are specialising in commercial vehicles as well as the conversion of tonneau bodies into those for side entrance. Mr. H. J. Chapman is the managing director.

THE new season's literature of the Coventry Chain Company, Ltd., comprises several interesting circulars which should materially assist the placing of their productions. One pamphlet gives a series of illustrations of leading types of cars, with suggestions as to the sizes of chains advisable to be used, and should be of general value for reference.

ONE of the latest productions of the Coventry branch of Messrs. Humber, Ltd., is a 10-12-h.p. four-cylinder, double-purpose vehicle so arranged that it can be converted without difficulty from a van to a pleasure vehicle or vice versa in two minutes by one person. Two bodies—a side entrance double phaeton and a cover van—built on the Windham system are supplied with the chassis. A similar chassis fitted with a commercial brougham for travellers' use is also being built by the Humber Company.

FROM Messrs. J. E. Hutton, Ltd., we have received a copy of the new catalogue of motor tyres they have just issued. The list is exceedingly complete, containing as it does the prices of the different sizes of all the leading motor tyres and non-skids at present on the market. It forms one of the sections of the great general catalogue that the company have in course of preparation, which will form a standard work of reference, not only for users, but also for the trade and consulting engineers, and will be particularly useful for export purposes. Sections dealing with Mercedes spare parts and Berliet spare parts have been issued. A feature of the catalogue is the special telegraphic code every item being given a distinguishing letter and number printed in red to facilitate telegraphic orders.

THE STAR ENGINEERING COMPANY, of Wolverhampton, who have always made a special line of Cape cart hoods, are now in a position, having so far extended their works, to supply these in any quantity to fit any type of car.

A NEW white paint for painting the rubber matting used on cars is being introduced by the Union Rubber and Chemical Company, Ltd., of Manchester.

FOR a long while used exclusively by owners of six-cylindered Napier cars, Messrs. S. F. Edge, Ltd., are now selling as many of the Napier sparking plugs for use on other cars as are sold for use on their own vehicles.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, FEBRUARY 22, 1908.

[No. 468.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

WHEN introducing his Budget proposals last year, Mr. Asquith rather definitely hinted that there was a probability of motor vehicles coming under his purview in connection with the financial arrangements of the Treasury for 1908, an anticipation which adds to the importance of the deputations which waited upon him on Tuesday, in order to represent the opinions of motorists before the introduction of this year's financial statement. Representatives of the Royal A.C. attended the House of Commons at the request of the Chancellor of the Exchequer, to afford him information on certain points, apparently in view of probable changes with regard to taxation. They were introduced by Mr. C. D. Rose, M.P., with whom was Col. Holden and Mr. Mervyn O'Gorman, Messrs. E. Manville, H. G. Burford and Claude Johnson, on behalf of the Society of Motor Manufacturers and Traders, and Mr. Robert Todd, who represented motor-cyclists with the Secretary of the R.A.C. Subsequently, Mr. Asquith saw a second deputation of motorists—this time from the Motor Union. The attendants included representatives from many of the provincial clubs, and each of the spokesmen dealt with some special aspect of the matter for the information of the Chancellor. Mr. Joynson-Hicks, the new chairman of the Union, submitted the views of the body he represented with regard to the general question of taxation, and urged that if new taxation was to be imposed it should be on the basis of the recommendation of the Royal Commission as to weight, and not on horse-power or cylinder capacity. The matter is fraught with difficulties owing to the wide range of interests involved. As will be seen from the report on another page, allowance must be made for the means of the majority of motorists; and they will be describable as "moderate." This is the growing tendency as the automobile increases in universal favour and use. Consequently, nothing should be done that is likely to restrict the industry and the growth of the motor movement. That is a point to be urged in the national interest.

A Comparison of Taxation.

THEN, too, it must not be forgotten that the users of motor-vehicles are at the present time taxed at a higher rate than the users of horse-drawn vehicles. For motor-cycles fifteen shillings is paid annually, for cars weighing up to one ton two guineas, and for cars weighing over one ton four guineas. In addition, there is the initial registration fee of one sovereign, and the annual driver's licence of five shillings. A one-horse carriage pays only one guinea, and a two-horse carriage, two guineas. There is no initial registration fee and no annual driver's licence. A doctor or a commercial traveller who substitutes for his gig a single-cylinder car, which causes less wear and tear to the roads, is already penalised for adopting the modern and more efficient method of locomotion (forty-seven shillings, as against fifteen shillings). If the damage done to the roads is to be taken as the basis of taxation, the

comparative injury caused by all classes of vehicles should be scientifically ascertained, and taxation fairly adjusted between them. It is not equitable to select one class of vehicle, and that the most efficient, and to place upon it a burdensome tax.

The Accuracy of Taximeters.

WHEN the taximeter motor-cabs first appeared on the streets, we drew attention to the need of securing official examination of the registering instruments so that the "fare" should have some assurance as to accuracy. We are now gratified to be able to announce that the authorities in London will, in future, decline to licence any motor-cab whose taximeter does not bear the seal of the Physical Laboratory at Kew. This innovation began on Monday last, and a limit of three months is allowed for existing taximeter motor-cabs to come into line. By the middle of May every taximeter in London will have to bear the hall-mark of the Laboratory inspection. The next step should be to secure annual inspection of the instruments.

The Irish Trials.

ELSEWHERE we give the itinerary of the Irish Reliability Trials, which should attract many sportive motorists to the Emerald Isle this year. We know the Irish police have a kind regard for motorists; the organisers of the Trials are rapidly gaining experience, and all things point to a very successful event. On the first day the run will be northward to Portrush, going through Drogheda and other towns visited by those who went to the Castlewellan meet in the memorable Irish Gordon Bennett year. Then will follow a run of 173 miles back to the Irish capital. The third day's itinerary will be of greatest interest. As far as Monasterevan, nearly forty miles from Dublin, the route will follow the way that gained international renown in 1904. Among the towns traversed will be Naas, where the weighing-in took place in the year just mentioned, and Jenatzy, Gabriel, De Knyff, and others astonished the natives at the way they lightened weight; Kildare, Abbeyleix, and Cashel, with its lovely and picturesque ruins; Tipperary, and its associations with historic events, and Killarney. And then a whole day will be spent in that delightful spot, the pleasures of the Lakes supplanting the car in favour for the nonce. The return will be via Cork, a journey of 161 miles—one of the most entrancing trips that could be taken in Ireland. Killarney will be left by the Killorglin exit, and the journey resumed by the tortuous road to Kilgobnet and Lough Acoose. Leaving Carranua, towering 3,414 ft. above the sea, the way will be to Waterville, Derrynane, along a perfect road to Parknasilla with its charming demesne, Blackwater to Kenmare and Glengariffe, where at Eccles Hotel will be found the splendid garage to which we referred when in course of building last year. Then comes the surprise of the tour, the Pass of Keimaneigh—one of the loneliest and wildest passages in the British Isles. The road then deviates to lonely Gougane Barra, with its shrine of St. Finn Bar nestling at the foot of precipitous mountains that rise a couple of thousand feet above the lake. Returning to the main road, the lakes of Inchigeela will be in sight for some time, and

then, after the clean little village of that name, there is a nine-mile run to Macroom, one of the most untidy Irish towns of the south. But after Coachford the scene will brighten, and Cork is reached via Carrigrohane and Inniscarra. The itinerary back to Dublin presents another varied impression of the country, and, regarded as a whole, the forthcoming Trial will give visitors a comprehensive view of Ireland. The rules and regulations will be issued shortly. Meanwhile we may mention that they are on similar lines to those of last year, with the exception that the petrol consumption will not be taken into consideration.

The Indian Trial.

THE official programme of the Reliability Trials of the Motor Union of Western India at the beginning of the month is a most interesting and complete souvenir of that important event.

Several photographs of persons and places associated with the Trials are given, while the list of donors, headed by the leading Maharajahs and most influential men of the Dependency, confirms our impression of the great hold that motoring has obtained on the chief men in India. Everyone joined in securing success, and the engineers of every district through which the route lay assisted the police in securing

Touring in Holland.—The last of the Watergates in Rotterdam.

the safe and certain progress of the cars. The road authorities, too, did much to improve the roads for the purpose of the Trials, notably from Bombay to Thana. The rules and regulations were couched on lines familiar to entrants in British trials, and the meetings of observers and opportunities for consultation showed how closely the organisers have followed the Scottish event of last year. The entries totalled thirty-four, and comprised the following cars:—Fiat (8), Siddeley (4), Richard Brasier, Sunbeam, Panhard, Peugeot, Rolls-Royce, Beeston-Humber (3), La Buire, Brown, De Dion, Adler, Belsize, Alldays, Stella, Argyll, Coventry-Humber, Wolseley (2), Otav-Milana, Clement-Bayard, Lacoste, and Battmann.

Is It Peace?

OBSERVERS in the automobile movement have noted that there is less truculence about than was the case when the New Year came in, and some even go so far as to hope that the Lion will soon lie down with the Lamb, without specifying in which of the rival organisations the attributes of the particular animals may be found. It will be remembered that Mr. Grace, of Manchester, and others have been striving to bring about a reconciliation. The committee appointed by some of the pro-

vincial clubs for this purpose has already interviewed the R.A.C. and the M.U. executive committee, and now the official notice convening the General Committee of the latter body for Wednesday next contains the following significant sentences:—“I am to take this opportunity of informing you that the Executive Committee of the Union received on Monday last a deputation of representatives of provincial clubs which had previously waited upon the Club Committee of the R.A.C. for the purpose of negotiating a friendly arrangement between the two bodies. The deputation did not put forward any suggestion from the R.A.C., but the Executive Committee intimated, on behalf of the M.U., that the Union would be prepared to accede to any reasonable proposition in order to put an end to the present conflict and secure a working arrangement between the two bodies. In order to give the ‘Peace Committee’ an opportunity of further continuing their efforts, it has been thought desirable to postpone the meeting of the General Committee, which is ordinarily held on the third Wednesday of the month to the fourth Wednesday, in the hope that they will then be in a position to place some proposals before the Committee.” We are not without hope.

Clear Roadways Wanted.

THE police in many parts of Sussex are taking action against farmers and others who have been leaving hedge clippings for a long and unreasonable time on the highway. In one case, heard on Monday, it was said that the defendant had finished the trimming three weeks earlier, and the clippings were placed by the side of the road. Defendant’s contention was that the opposite hedge had also been cut and that the clippings found were not from his side, or if they were they must have been purposely placed there. It was also suggested that the brambles fell from the cart when his neighbour’s clippings were being carted away. Not being a motorist he was given the benefit of the doubt; but the example should be a warning to others not to make thorny the way of those who travel on pneumatic tyres.

Speed Limits in Scotland.

THE Secretary for Scotland has received applications for the restriction of the speed of motor-cars in various specified streets and highways in Cowdenbeath, Helensburgh, Troon, and Dumbarton. On Saturday last an inquiry into a speed limit application by the burgh of Dunbar was held by Mr. Alexander Stewart on behalf of the Secretary of Scotland. Last week, too, Mr. R. J. Smith, the Secretary of the Scottish A.C., had a meeting with the streets committee of the Burgh of Dumfries with regard to the proposed application for the imposition of ten-mile limits within the boundaries of the town. The result was that the committee agreed to recommend the Town Council to abandon their proposal and to erect warning signals to be supplied by the club at various points in the town. These are a few instances of the activity which prevails in motoring circles north of the Tweed, and prove the value of unity in organisation.

Roads.

CONFERENCES with regard to roads are apparently the order of the day, and on Saturday last, under the auspices of the Royal Sanitary Institute, an important meeting took place at Nottingham. This was attended by many road authorities, before whom Mr. Arthur Brown read a paper, in which he pointed out that the only way to deal with the dust and mud nuisance was to adopt some kind of tar macadam road, which could be made cheaply if some of the heaps of slab and granite which were now regarded as waste material could be utilised for the purpose. He agreed that any taxation of motorists might well be applied to dealing with the roads of the country, seeing that their vehicles were responsible for a good deal of the damage. Mr. E. R. Purnell Hooley, who subsequently gave the experts

present a practical demonstration of this system of road-making which has been well appreciated by motorists passing through the county, said that within a radius of fifty miles from Nottingham there had been registered 328 motor-lorries, 9,000 motor-cycles, and 10,000 motor-cars. In addition, Nottingham was inflicted by the visits of 535 traction engines with a daily licence, the full licence being taken out elsewhere. If discrimination is to be paid with regard to the taxation of various types of motor-vehicles, the whole subject needs review and revision, for the influence of traction engines and heavy farm carts is far more detrimental than the motor-vehicle used for ordinary touring in this country.

Motor Repairers.

AT the suggestion of the Touring Committee of the R.A.C., the question of the appointment of repairers has again been considered, and it is evident that the holding of the Club's mechanical proficiency certificate will play an important part in the appointment of official repairers in the future. Although a proposal to make it obligatory on the part of applicants

—either to cancel the existing registration or to continue the old number. Should he already possess a car in the circumstances mentioned by our correspondent he cannot transfer his existing number to the second car. Under such conditions his better plan is to communicate to the authority with which the latter was registered the change in ownership, and by paying a fee of five shillings secure the legal continuation of the number. So frequently have motorists omitted to take this simple precaution that the registration authorities of certain districts have been glad to avail themselves of the publicity of our columns to remind those who buy second-hand cars of their obligations to the authorities.

During Divine Service.

WERE new legislation in connection with automobilism to enact that the blowing of horns should be prohibited from cars when passing churches during service time—as has been frequently suggested by that ubiquitous person, "Constant Reader"—it would not be an innovation. As in many other matters concerned with the motor-car, it would be

The Bishop of Southwell, the Right Rev. Dr. E. Hoskyns, and the 20-h.p. Renault presented to him by members of the Church of England in the Southwell Diocese. (Howard Barrett, Southwell.

for such appointments that the principal of the firm or a leading employee should be the holder of such a certificate was not carried, it was agreed that those who now hold the appointments should be informed that the Touring Committee favours the idea of official repairers holding mechanical proficiency certificates. It has also been resolved that manufacturers who undertake repair work as a regular branch of their business might now be eligible for the Club appointment as repairers; and evidently efforts are being made to secure some sort of assurance that those who hold the title of R.A.C. repairers shall be proficient as well as have the necessary plant to do any work that may be required.

Change of Ownership.

THE point raised by our correspondent W. B. with regard to the numbering of cars on changing ownership is so frequently asked that we make no apology for giving it the prominence of these pages. Motorists should remember that the number assigned to a car is allocated to that particular vehicle and cannot be employed on any other. When, therefore, a vehicle changes ownership the new owner has two courses open

merely the revival of an old regulation which governed the mail coach drivers when the conveyance of postal matter was being organised in the early days of the last century. They were forbidden to blow their horns in passing through towns during the hours of divine service on Sunday—a prohibition much more necessary, however, in those stirring days than in the present times. At the same time, motorists must be credited with having, as a body, imposed such restraint upon themselves, as many vicars of impartial mind well know. Often, however, places of worship are located on corner sites, and the blowing of horns by motorists when nearing such points is generally out of concern for the public safety—a fact that is scarcely recognised by those who write letters of protest to the press.

ELSEWHERE in the present issue we give some interesting extracts of an article on motoring in the Hawaiian Islands recently published by the "Motor-Car," of New York.

MESSRS. FAIRE BROS., LTD., who have had a Dennis 2½ ton van in use for two years, have just placed an order for two 30 cwt. vans of the same firm's construction through the Midland Counties Motor Garage Company.

SOME NOTES ON MOTOR LAMPS AND HEADLIGHTS.

A GOOD artificial light is a necessity for night driving, but a powerful and really efficient light is a veritable luxury on the road, and one well worth the exercise of a little forethought and care in its attainment. To those motorists who have experienced the annoying delays which sometimes occur when lamps are unexpectedly wanted, the following practical hints are offered, in the hope that they may prove helpful in keeping the lamps of a car in the most efficient condition.

Commencing at the rear end of the vehicle there is the tail lamp, which, as many automobilists have found to their cost, is not legally accepted as a rear light. Paraffin is widely used for these lamps, and is more or less satisfactory according as one has secured a more or less efficiently designed lamp, and, furthermore, has got it well placed on the car. This latter point is of considerable importance; a variation in position of only a few inches will frequently suffice to bring a lamp into, or out of, a violent down or up draught when the car is travelling at speed. It frequently happens that a motorist will tenderly retain an old back lamp, that has served him faithfully in the past, to put on his new car; and lo! he finds his old favourite begin to play

The Halley 30-h.p. 12-seated Wagonette, recently supplied to Mr. John Wishaw, for public service work between Wishaw and Newmains, N.B.

This vehicle has been running since November 22nd last continuously, and Mr. Gibson informs us that since coming into his hands it has never been a single hour off the road through defects, and it has now covered a distance of about 3,600 miles. As a proof of the satisfaction which Mr. Gibson has received from the running of the wagonette, he has just placed an order for another vehicle of similar type.

him new tricks, owing to a slight difference in position, or to an altered shape of underbody, and resulting induced currents of air. An electric rear light is a great comfort, especially if the fitting is arranged within the body of a paraffin lamp. If, however, it is electric only, care should be taken to have a dummy holder within the lamp for the purpose of carrying a spare globe, for, unlike paraffin, these lamps cannot be obtained at the average country inn, and the parable of "the foolish virgins" has still a latter-day application. A small acetylene burner can easily be fitted within most lamps; this, with a length of copper tube along the channel frame, and a connection to the main generator, will give the motorist a rear light eminently suited for long runs. Almost invariably a fair proportion of the carbide is unused; and if there is gas for the headlights there will certainly be no need to worry about the tail lamp.

As to the other oil lamps one seldom seriously expects to drive after dark by their "dim religious light" alone, but they are principally useful for town work, as a graceful admission that it is past lighting-up time. They should, however, be regularly attended to even if they have not been alight, and it is for this

reason that the practice of tying them up in bags is not to be recommended; if they have to be cleaned, they stand a better chance of being kept filled and trimmed.

Now, as to the light: this may be from a single lamp, or more generally a pair of acetylene head lamps; in either case the position should be carefully chosen so as to throw the light on to the ground about twenty yards ahead of the car. Rigid brackets, well secured to the frame, should be insisted upon, both in order to increase the life of the lamp and the steadiness of the light, and also to protect the driver's nerves—a springy bracket will make the best of lamps rattle. Furthermore, let the front of the lamps be just behind the dumb-irons; many a skilful driver has been known to just "touch" things—even the blank wall of an awkward garage or motor-house, or an unfastened door—and a gust of wind will, under certain conditions, badly mark a pair of lamps in a few seconds, whereas a little paint off the dumb-irons is much cheaper to replace.

For head lamps a separate generator, conveniently situated in the car, is preferable, as this advantageously reduces the bulk and weight of the lamps and brackets. The gas is conveyed by the usual copper tube to the lamps, care being taken to make arrangements for the easy drainage of water at the lowest point in the piping, and to avoid loops or bends in which water can collect and cause a jerky light. The diving bell system of generator is the older pattern, but has nevertheless much to recommend it. Compared with many later types, it is less complicated internally and less liable to derangement, and is more easily and quickly cleaned. The pressure of gas being dependent on the height of the surrounding water, no gas-bags are required, which is a point worthy of consideration. In this connection it is worth noting that the water space should be filled, the lamps only getting the full gas pressure when this is the case. Although the newer types of generators permit of the water being cut off and the charge conserved, they do not on the whole score heavily over the type previously mentioned.

With the self-contained lamp—i.e., lamp and generator combined—care should be taken that the gas-bag is quite gas-tight in itself and at its connections; when lighting up, open the door wide and blow out any gas that has accumulated in the body of the lamp. Neglect of this precaution, coupled with a leaky gas-bag, will frequently give the lighter-up a busy few minutes, and if lucky it will do no more than put the owner in the market for a new lamp. Those motorists in particular who use their lights comparatively seldom should examine the lamps and fittings at regular intervals, and keep the rubber tube off the brass fittings as much as possible. A little black lead in the rubber tube end will prevent the same from sticking, and costing an inch of tube each time it is disconnected. The water container of the generator should be tested, for they spring leaks in the most unaccountable way when carried unused on the car, the fault being frequently discovered at a very awkward time, probably entailing a slow and risky drive home. Spares such as a length of rubber tube, gas-bags, burners, jointing rings, burner pricklers, &c., are supplied by the makers to suit their various products, and these should be on the car and easily to be found in the dark, for obvious reasons.

To sum up, my advice to motorists is, to equip the car with a full set of lamps, see that they are properly installed, and then look well after them. The advantages of a steady, bright light on the road 40 yards ahead, over a flickering semi-gloom, just showing up its insufficiency, will well repay in extra comfort for the little trouble and outlay involved, without considering the greatest and most important result, "security." CHOOK.

MESSRS. BOWEN AND CO. have opened a large showroom and garage at Shaw Street, in the centre of the city of Worcester. They have on show Talbot, Napier, De Dion, Siddeley, Humber and Rover cars, for which they are the local agents. Their workshop is replete with all necessary tools, driven by electric motor, and they can attend to motorists by night as well as day. Messrs. Bowen and Co. keep ten automobiles for hire, three of which are cabs. They have also just been appointed official repairers to the Royal A.C.

AN AUTOMATIC TYRE INFLATOR.

THERE have been many attempts during the past few years to introduce some means of inflating motor tyres to the requisite pressure without the laborious task of using the ordinary hand-operated pump. One that appears, by reason of its simplicity and efficiency, to be meeting with increasing favour is that known as Maxfield's Auto Tyre Inflator, which is made under Lord Tollemache's patents by Messrs. Maxfield and Co., of Victoria Road, Aston, Birmingham. We give a general view of the device in Fig. 2, and a sectional drawing in Fig. 1, from which it will be seen that it consists of an air compressor—the external appearance resembling to some extent that of a small motor-cycle engine—driven by friction direct from the flywheel of the motor, and actuated by a small lever from the dashboard. The apparatus really comprises two parts—an air compressor and an air chamber. The compressor consists of a cylinder F, 1 5-16 in. bore by 1 3-8 in. stroke, inside which is a piston P, fitted with three spring rings A, in a similar manner to an ordinary motor piston. This piston is operated by a leather faced friction wheel, not shown in the sectional view, and a balanced case hardened crank D; the bearings E are of phosphor bronze, as is also the connecting rod R. The cylinder and bearings are lubricated on the splash system. The air intake is fitted with a ball valve V; the outlet, which is similarly provided at V', is prolonged, and the end G screwed and coned for connection by means of a copper tube to the air chamber.

A small space just under the footboard, opposite the fly-wheel, can in most cases be found, where the inflator can be attached to the sub or main frame direct, or by interposing a small stiff bracket. The apparatus itself is bolted to the bracket by the swing back B so that the friction wheel can be brought into contact with the periphery of the flywheel of the motor by means of a flexible cable attached at one end to the lever L and

Fig. 1.

at the other end to the starting lever shown in Fig. 4, which can be fixed in any convenient position near the driver that gives a direct pull to the cable. There is thus no necessity to lift or remove the floor boards or engine bonnet to put the inflator in or out of action. All that it is necessary to do is to attach the tube from the air chamber to the tyre to be inflated, start up the engine and bring the friction wheel, by means of the lever provided, into contact with the motor flywheel. Care must be taken that the friction wheel is perfectly parallel with the periphery of the flywheel, and is fixed so that they clear one

another by about one-eighth of an inch when the inflator is in a normal position. The apparatus will work in practically any position, but preferably nearly vertical.

The air-chamber, Fig. 3, is made of gunmetal, and serves as an oil trap, thus preventing any lubricant from the cylinder being forced into the tyres. A drain cock, by which any oil that should collect can be drawn off, is fitted, as is also a pressure gauge registering up to 150 lb. per square inch. The top part of the air-chamber also serves as an adjustable safety valve, and can be

Figs. 2, 3, and 4.

set to blow off at any desired pressure, so that all danger of over inflating the tyres is obviated. It is intended that the air receptacle should be attached to the dashboard or the side of the car, with the adjusting screw of safety valve vertical. The cover of the pump can be placed in three positions by the removal of four set pins, to allow the connection between it and the air-chamber to be readily made. A 10 ft. length of flexible tubing with connections is supplied with the inflator, which weighs only 5 lb. complete; its dimensions are very small, viz., 7 in. high by 4 in. by 4 in. In addition to inflating tyres, the device can also be used for operating pneumatic jacks and raising the pressure in fuel tanks.

A NEW INNER TUBE.

IN our last issue we briefly alluded to a demonstration of a new puncture-sealing inner tube to which has been given the title of "Sealomatic," by Messrs. Gillespie and Co., at 266, Vauxhall Bridge Road, S.W. The leading claims made for these new tubes are that, owing to the fact that they contain no liquid solutions, their resiliency is in no way diminished, and that the net weight of the tyre as a whole is not appreciably increased. The tube is made in the usual mould, and is, in addition, furnished with two interlinings, neither being of the nature of a fabric, the expansive and contractive efforts of the rubber being, therefore, unimpaired. It is claimed that in the process of manufacture both linings become homogeneous with the rubber composing the tube, and in the perfected models are quite equally distributed over the inner surface. The innermost lining is of a "tacky" or sticky character, and it is to be presumed that this forms the sealing material. Inspection was invited of a number of tubes which had been run long distances and which had been punctured, both accidentally and purposely, a great number of times, notwithstanding which they stood up to their work perfectly. A short run over a bumpy road surface served to demonstrate that resiliency was not affected by the interlinings and that the behaviour of the tyres was quite normal. The new tubes are somewhat higher than usual in first cost, but the freedom from trouble and the satisfactory behaviour of the tubes under the worst conditions would appear to be ample compensation.

A TYPE of car specially designed for medical men has been introduced by Argylls London, Ltd. This is a two-seated vehicle fitted on a 14-16-h.p. chassis, and gives doctors a style of automobile well suited to their particular requirements.

MOTORING IN THE HAWAIIAN ISLANDS.

A TOUR of the Hawaiian Islands is not likely to suggest itself to the average motorist, but to the comparatively few who have tried it the experience will surely remain with them as one of the most pleasant in their lives. The group of magnificent little dots in the middle of the map of the Pacific Ocean which represents the Territory of Hawaii also forms one of the most delightful places for a vacation that the whole world affords, especially in view of the extent and excellence of the road system. Indeed, there is hardly a place on the mainland where the possibilities for enjoyment with a motor-car are not great, a fact which is yearly becoming more and more recognised by tourists.

The area of the islands is only small by comparison with the great spread of the Pacific Ocean about them; each of the four principal islands of the group are all so cut up with roads through such tempting country that one does not soon exhaust the novelty of touring the islands. There is probably no part of the United States where the roads are so uniformly well constructed and cared for as in the Hawaiian Islands; most of them are macadamised and have been laid out by skilful engineers with such care that even through the most mountainous sections a gradient of more than 1 in 12 is the exception. Six per cent. grades have come to be considered the best, and all new road work is based on this idea. Imagine a road over 250 miles in length, with no hills of over 1 in 16, yet rising from the sea level to an altitude of between two or three hundred feet in places, and constructed almost entirely of hard black lava rock macadam, or of white coral, as smooth almost as a floor. Such a road as this is the one which belts the largest island of the group, Hawaii. It is this island also which contains the two great active volcanoes Mauna Loa and Kilauea, and no one can have any conception of the diversity and magnificence of the scenery which this road makes easily accessible. A number of persons have established paying businesses in supplying motor-cars for the trip, and the several garages in Hilo, the principal town, always contain a number of machines owned by visitors who have brought them from the mainland.

In leaving Hilo for the run round the Island, one almost immediately begins to ascend by a most picturesque road until an elevation of 1,800 feet is reached. Here, on the brink of a most magnificent cliff, the road follows the north-eastern coast line of the island for some fifty-five or sixty miles, dropping down to the sea again at one or two places. This stretch of road is considered by many to be the most magnificent from a scenic point of view of any in the territory. As one drives along the top of palisades which drop almost vertically into the ocean hundreds of feet below, the panorama of sea and sky spreads out before one for about sixty miles in every direction. Words are pale and inadequate to describe the grandeur of the view, and it is one that once seen must always stand out vividly among all others.

Leaving the coast the road strikes across the north-western peninsula of the island, over a plain of between 2,500 and 3,000 feet elevation. At different points along the way long stretches of dense tropical forest arch above the road, shrouding everything in dim twilight gloom. Parts of this are the famous "fure forests," in which most of the vegetation is of giant ferns tower-

ing like trees to the height of from fifty to seventy-five feet. These forests are most beautiful and are one of the chief attractions of the islands. From the little town of Waimea, in the northern part of the island, the road swings away towards the south-west until the western coast is reached, when it bends with the coast line toward the south. A portion of the way is across immense barren plains of lava, poured out from the three great volcanic cones of Manua Kea, Launa Loa, and Hualalai, in ages past. Here the roads are formed of hard black lava rock, and are equal to almost any kind of road in the world. The scenery on these lava wastes, too, is attractive in its weirdness, and one has a feeling that he is traversing the surface of some strange planet, rather than a part of the earth's surface.

Always to the mauka, or landward side, as one whirls along, rise the imposing peaks of the volcanoes, like slumbering giants. Mauna Loa is the only one of the three that has been active in modern times. It rises to an altitude of 13,675 ft., which is a trifle less than the elevation of Mauna Kea. Their rise is not abrupt, being for the most part a comparatively gradual slope up from the sea to their craters. Almost mid-way of the west coast of the island, between the towns of Kealahou and Napoopoo, and almost opposite from Hilo, is located the monument marking the resting place of the famous explorer and discoverer of the Islands, Captain Cook. The tall graceful shaft stands in a little cove a short distance back from the shore of a beautiful indenture in the coast line known as Kealahou Bay, and visited by most tourists to the island.

Towards the extreme south of the island is the only poor piece of road encountered in the circuit, and this will not be so for long. It is five or six miles in extent, and is across the latest lava flow from Manua Loa. The road was entirely obliterated by the great mass of fluid rock which poured from a newly-formed opening in the side of the mountain and flowed toward the sea. The road was only recently opened across the flow at the expense of several thousand pounds. Although this

bit of the journey is rough, it is possibly the most interesting to the sightseer.

Fifty miles more of good road brings one to the Volcano House, a well-appointed and managed hostelry on the very brink of the great crater of Kilauea. This volcano is a great open pit between two and three miles across, and is the Mecca of all travellers to the islands. It is not greatly elevated and is easily accessible. It is always interesting, and at times its whole floor breaks up and the great molten cauldron of lava forms one of the world's most spectacular scenes. From the Volcano House back to Hilo is but thirty-one miles of perfect road, for the most part across lava plains. It can easily be traversed by a good car in an hour's time. The circuit of the island does not by any means constitute all the attractive drives in Hawaii. On the contrary, there are many others equally interesting though not so long. The great sugar plantations on the lowlands of the island and the coffee plantations in the higher districts are easily visited, and are of much interest. The same is true of the newly-developed rubber industry, and the pineapple district, all of which combine to make a most fascinating variety of drives for the automobile enthusiast.

What has been said of motoring in Hawaii is true of all the other islands, only in possibly lesser degree. Maui has a splendid system of roads and much to interest a tourist, including the great crater of Haleakala, which is the largest extinct volcano in the

Motoring in the Volcano District of the Hawaiian Islands.

world. Kauai, the "Garden Island," although comparatively small, is netted with good roads, and has many attractions of its own which make it well worth visiting also. But Honolulu, of course, and its surrounding districts, comprising the Island of Oahu, leads all the rest of the territory in the matter of motoring, and there is probably no community of its size, after eliminating the oriental population, where there are so many and such high grade cars in use. An active association of automobile owners keeps alive a keen interest in the sport, and several up-to-date garages make the keeping of the machines in the best condition an easy matter.

Almost every passenger on trans-Pacific liners, which stop at Honolulu nowadays, has an opportunity of taking a number of delightful short scenic drives while the vessel is in port. Like the other islands of the group, Oahu has a splendid system of roads, all of which traverse a most interesting country. One which is the most popular is about seventy-five miles in length and makes a short day's drive, allowing plenty of time to stop at the numerous places of interest. The island of Oahu is broken by two rugged mountain ranges. Six miles up the beautiful Nuuanu valley from Honolulu the road crosses a divide in one of these ranges through an artificially constructed pass down the northern side which is almost sheer precipice in some places nearly a thousand feet high. This point is recognised by travellers as being one of the most beautiful scenic views anywhere; and besides, it possesses the charm of great historic interest. It was here that, in the last century, Kamehameha I., called the Great, and often "The Napoleon of the Pacific," in his conquest of Oahu, drove the army opposing him, step by step, mile by mile up the Nuuanu valley until finally at the great Pali (cliff), unable to retreat further, a desperate conflict took place, resulting finally, however, in the entire force of Oahuans being driven over the awful precipice to meet death 400 feet below. It is said that 1,600 men thus perished. Human bones and weapons are still to be excavated from beneath the accumulation of vegetation and earth from the cliff, which, in course of years, buried the remains of the defeated army several feet beneath the surface.

Five miles further down a magnificent road carved out of the solid face of the precipice, winding down to the plain below at a uniform gradient of one in twelve, the north coast of the island is reached. Twenty-five miles along the beach, following the picturesque north-west coast line, much of the distance on the hard coral sands washed up from the reefs, and Kahuku Point, the northernmost point of land, is reached. All this distance the scenery is most fascinating, with its flanking of fantastically rugged mountains towering close on the left, while on the right the beautiful, calm waters of the lagoon lap gently on the beach, or where the reef barrier is not intervening the great swells from the North Pacific Ocean break savagely on the rock ribbed shore, with a roar that never ceases, while the strong steady sweep of the Trade winds from the north-east whips the salt tang from the wave crests and carries it with exhilarating freshness to the nostrils.

From Kahuku the run south along the west coast for fourteen miles is, for the most part, over a glistening white road of coral, where a machine runs with scarcely a vibration. At Haleiwa, the "Beautiful House" is one of the most charming little hotels to be found anywhere.

The run from Haleiwa back to Honolulu is thirty-one miles across the broad fertile plains that lie between the two mountain ridges. The road passes through thousands of acres of pineapple plantations and sisal fields, and is very interesting. This part of the territory has developed from open pasture lands to its present high state of cultivation within the past five or six years, and is steadily increasing.

The Honolulu Automobile Club has over one hundred members, and to it the whole country owes much in the way of road improvement and interest in motoring. The organisation has a number of wide-awake and energetic members, and a number of enterprises which they have undertaken and carried out have been unqualified successes, and have gained more than local recognition.

THE RENAULT PEDAL-OPERATED ENGINE STARTER.

SOME particulars of the novel and ingenious engine-starting device lately adopted by Messrs. Renault Freres on their 10-14-h.p. car have already appeared in the *M.C.J.* We are now able to illustrate the arrangement and to supplement the information already given. As will be seen, the apparatus is located between the gear-box and clutch and is operated by a pedal A, situated on the footboard near the usual clutch and brake foot levers. The pedal is connected with a toothed sector B, which in turn is in mesh with a toothed rack C, the latter also being in gear with a pinion G on the clutch shaft. The rack, which slides up and down in a bronze casing bolted to the end of the gear-box, is, after being forced down, automatically raised by the spring F. The lateral thrusts to which it is submitted by the effect of the sector and the pinion are taken up by friction rollers, which reduce to a minimum the power necessary to operate it.

The pinion G is mounted loosely on the shaft K, and is provided with a free-wheel ratchet device—shown separately in the

Sectional View of the Renault Foot-Controlled Engine Starting Device.

lower part of the illustration—so that when the speed of the shaft exceeds that of the pinion, which occurs when the engine is started, it simply overruns the free wheel.

To start the engine, all that the driver has to do is to place the change-speed lever in the neutral position and then quickly press the pedal down several times; the result is that the clutch shaft, and through it the crank shaft of the engine—the clutch being engaged—is rotated, and, with the throttle and ignition levers in the proper position, the motor is soon started up. The whole arrangement is exceedingly simple and effective, and takes up an extremely small space, and that in a position where it can cause no inconvenience. We are indebted to our French contemporary, "L'Automobile," for the illustration.

RETURNS just to hand show that the exports of motor-cars and parts from the United States during last year attained a value of £1,151,384, as compared with only £881,837 in 1906 and £539,131 in 1905. England heads the list as being the best customer with £347,697, Canada being second with £233,471, Mexico third with £125,961, and France fourth with £119,290.

THE RATIONALE OF LUBRICATION.

By J. W. FRINGS.

NOW that the spring is nearly here, those on motoring bent begin to look eagerly forward to the speedy consummation of the pleasurable anticipations indulged in during the long and tedious winter. Even to those motorists cast in a sterner mould, to whom the joys of the pastime appeal with nearly equal force all the year round, the approach of summer heralds further pleasurable prospects. There is the new car to be tried, with all its unknown possibilities for keener enjoyment, or the old one, fresh from the hands of its skilled physician, with rejuvenated appearance and enhanced virility, to be humoured and cajoled into surpassing all its previous feats of exhilarating movement. This is, doubtless, one of the greatest attractions of motoring—the continual progress from point to point of advance, the constant evolution to fresh phases of comfort, economy, and efficiency. With it all there was never more need than at the present time for intelligent and thoughtful handling of motor vehicles. Every refinement of construction and adaptation, while making for perfection in the car itself, provides a wider field in which the differences of

The Fleet of three Siddleley 18-h.p. Motor-Ambulances just supplied by the Wolseley Company to H.M. War Office.

longevity and output, resulting from care or neglect, are most distinctly emphasised.

Take, for instance, the question of lubrication. The modern car of good class is usually fitted with a lubricating system that is assumed to be automatic—in which the necessity for intelligent observation has been entirely eliminated. There never was a greater mistake. Lubrication, to be absolutely effective, implies much more than merely filling the tank and setting the feeds in action when the engine begins to run. The special function of lubrication is to substitute for a solid bearing of very high frictional capacity a liquid one. To serve this end adequately there are many factors to be considered. The quality and quantity of the oil to be used, its continuous application upon, and its effective distribution to, the various bearings involved, are the principal. It may be as well to note first the characteristic differences between a solid and liquid bearing in their respective relationships to frictional losses. When two solid substances are in intimate mechanical contact there is a tendency for the motions of translation, or rotation, to be converted into molecular motion or heat. This is partly due to the cohesion which always exists when solid bodies, with their comparatively stable molecular constitution, are in close contact. This force of cohesion tends to resist the change from rest to motion, and produces, when work is done, a molecular motion, first appreciated as the expansion due to heat. The expansion causes adhesion between the bearing surfaces, and is accom-

panied, if the motion be continued, by a rending, shearing, or distorting action on their surfaces. This in turn gives rise to more intense molecular motion in the bearing, and ultimately the whole of the mechanical energy is transformed into heat energy, which finally arrests the motion of translation or rotation. Result—a seized bearing. On the other hand, when a liquid the molecular particles of which are much more free in their relative motion, is interposed, as a thin film, between the bearing surfaces, the moving parts are “floated” on the film of lubricant. There is, then, scarcely any appreciable tendency for the motion of translation or rotation to be converted into heat energy, because of the mobility of the oil. The freedom with which the oil molecules move from and return to their respective relative positions permits the rapid passage over their surface of a foreign body without more than a mere functional disturbance, which is immediately compensated by the inherent activity of the molecules, the latter being the result of the balance of the attractive and repellant forces which constitute it a liquid. So far, in considering this question of molecular motion, we have dealt only with the physical forces involved; but, as we shall see, there are also chemical forces to be taken into account, which have much to do with the efficacy of lubrication. These will be dealt with presently.

The primary function, then, of a lubricant is to provide a “floating” bearing for the moving parts. In this connection the quality of the oil is of vital importance. It must necessarily be of such a character that the gravitational, or weight, factor of stress, acting on, say, a revolving shaft, is more than balanced; that is, the oil must possess properties which will enable it to retain its physical characteristics, as a liquid, under the greatest pressure to which it is subjected. It must have a sufficient “body” to ensure that it is incapable of being pressed out of its film nature in every part of the bearing in which it is used. Failure on this point produces a dry, and unlubricated, bearing, with all its attendant difficulties and disadvantages. Most fair quality oils, it may be at once admitted, answer this primary requirement. Where many fail, however, is in resisting the chemical changes which invariably accompany the production of heat in a bearing. Nearly all oils are specific compounds of hydrocarbons. Some are particularly stable, where the atomic structure is simple, whilst some, owing no doubt to their complex structure, are particularly unstable in the presence of heat energy. It is, of course, the latter which are the cause of trouble. In dealing with the physical forces we saw that the integrity of the molecule as such, is not interfered with. Even if the last trace of oil were to be forced out from a bearing, owing to excessive and unbalanced pressure, the oil would still preserve unaltered its physical characteristics, and be suitable as a lubricant for some other purpose, because it is still a liquid, its molecular constitution remaining unaffected.

With the chemical changes induced by heat, however, there is an alteration in the structure of the molecules. The oil, which, before the application of the heat, was an apparently permanent combination, principally of hydrogen and carbon, now becomes fractionally vaporised, and at each successive change becomes less able to support its original intention. Its peculiar, and essential, properties as a lubricant are lost, and what is left of it tends to become a solid, or solids, with all the dangers of solid friction. These changes are constantly occurring in the cylinder of a petrol motor, and, in a lesser degree, accompany the evolution of heat, generated by frictional losses, in every bearing. These chemical changes are proportional to the rise in temperature, and to the specific atomic structure of the molecules of the oil. A lubricant of the best quality, therefore, should possess a physical and chemical constitution which will permit of a high safety factor over possible dissociation from rise in temperature, as well as presenting sufficient physical resistance to excessive pressure.

Coming now to the quantity of oil which is necessary to ensure the efficient working of a bearing, we have to consider the actions and processes which are constantly at work, and which render the renewal of the oil supply necessary. These may be briefly described as wastage, physical deterioration, and chemical changes. It is extremely

difficult to design and construct any bearing from which there shall be no leakage of oil, and absolutely no loss by unnecessary friction. At the best a compromise is effected, and the wastage reduced to the minimum without unduly increasing the friction in making the bearing quite oil-tight. Theoretically, the perfect bearing would be one in which the whole of the running gear was immersed in oil, and surrounded by an air-tight case. But even this would not effect an absolute cessation of wastage. The extreme mobility of the molecules of the lubricant, and the various forces which tend to disturb its relative state of rest, make it well-nigh impossible to avoid a loss on this score. And, even if it were possible to retain it for any length of time in its particular bearing, this is not advisable. Physical deterioration of the quality of the oil is produced by the wear of the moving parts resulting in a gradual admixture of the fine solid particles of the metal, abraded by friction. It is an axiom of physical science that no two atoms are ever in virtual contact, and in addition to this natural and inviolable physical separation, we take the precaution, by the use of a lubricant, the most suitable for the purpose, to interpose a further and yet more effective means of separation. And still we are confronted with the apparent paradox

their place those properties, or physical characteristics, of the respective elements which are the base of the compound appear instead. As, it has been noted, these changes, although perhaps not appreciably, are actually in progress, in some degree or another, all the time, it is necessary constantly to freshen and renew the lubricant, to preserve its essential qualities. In relative order of importance we may place these necessities for replacement as follows:—First and greatest, wastage; second, physical deterioration; and last, except in its relation to the cylinder, chemical change. It will have been observed that the expression “freshen and renew” was used in dealing with the question of the quantity of oil to be used. It is not possible to wholly renew the lubricant without considerable trouble. To accomplish this effectually it is necessary to wash out all the bearings with petrol or other oil solvent, and this, besides entailing much time, is sometimes a source of subsequent mischief, where the new lubricant has failed to effect its complete distribution before work has been restarted. Moreover, it is hardly ever necessary to wash out, when the motor is in constant action. The fresh oil, as it is added to that already in use, tends to replace it by a natural process of circulation, in

The 30-36-h.p. Petrol Motor First Aid Tender and Fire Escape recently supplied to the London Fire Brigade by Commercial Cars, Ltd.

of particles, never in actual contact, mutually altering their relative physical relationship. We know that this is caused by the law that all bodies tend to obey, and therefore move, in the direction imposed by the strongest force acting upon them at the time. Although the particles of the bearing, and the lubricant even, are not in actual contact, and usually obey the law of cohesion, the attractive force of which binds their adjacent particles together, yet when the greater force of friction, exhibited as heat or molecular motion, is acting, the particles of metal obey this, the stronger force. The continual dropping of water upon a stone will “wear it away.” That is, erode it, or even dissolve it. In the same way, but acting under the direction of another force, the continual friction between the solid of the shaft, say, and the liquid lubricant, and between the solid of the journal and the liquid, results in the “wearing” of these solids, by the separation from their surfaces of minute particles of their substance, which are held in suspension by the liquid, and when present in appreciable quantities soon begin to exercise a very active, and additional, attrition.

The chemical changes which occur in the constitution of the lubricant have already been referred to. Whenever chemical changes take place, whatever may be the immediate cause, the essential properties of the compound body disappear, and in

which such diverse forces as capillary attraction, gravity and centrifugal force, are actively at work. A proportion of the oil in use is lost by wastage, and this is, almost necessarily, that which has lost its initial viscosity and has been subjected to the greatest use. It is, moreover, the most heavily charged with metallic particles. Inferentially, it is most unwise to check this wastage, when it is seen to serve so useful a function

(To be concluded.)

THE garage of the Thornton Engineering Company at Belle Vue, Bradford, is now open day and night. There is special accommodation for cars to be washed during the night ready for next morning.

MESSRS. JAMES H. RANDALL AND CO. have opened a new metal warehouse at 31, Marylebone Lane, Wigmore Street, W. At their works in Green Street, Paddington Green, they have for a considerable time carried on sheet metal work of every description for the motor trade, making fittings for petrol tanks, bonnets, silencers, &c., as well as castings in brass, gun metal and aluminium. At their new place they have a large stock of solid drawn copper tubes, unions, petrol taps, screws, &c., all of which will be of special interest to the industry.

CONTINENTAL NOTES.

The A.C.F. Grand Prix Races.

The entries for the A.C.F. Grand Race (heavy cars) have received considerable additions during the past week, no less than forty-five cars being entered by Saturday evening last, when the list at single rates was closed. The vehicles which will compete in the event are three each Germain, Benz, Fiat, Panhard, Motobloc, Mercedes, De Dietrich, Austin, Renault, Opel, Clement-Bayard, Brasier, Weigel, and Itala, two Porthos, and a Thomas. There will thus be twenty cars in the contest representing France, nine on behalf of Germany, six for England, six for Italy, three for Belgium, and one for America. The Grand Prix des Voiturettes has brought forward an even larger "field," no less than fifty-eight vehicles having been entered for this event, viz., three each Isotta-Fraschini, Rolland-Pilain, Lion-Peugeot, Guillemin-Le Gui, Alcyon, Grégoire, Busson, Sizaire-Naudin, Martini, Le Metais, Delage, Werner, Corre, Ampere, and Aries, two each Bailleau, Demeester, and Monnier, and one each Fouillaron, Vulpes, Truffault, De La Roulière, Arion, Passe-Partout, and Stabilia. Three of the cars are of Italian and three

favoured, is that around the Puy de Dome mountain, in the department of that name, in the district on which the Grand Prix race was held in 1906. The track would consist of a double and parallel loop, each 12½ miles long, and crossing one another by means of a bridge. The total distance would thus be 25 miles. The double track, which it is proposed to light by electricity, will be about 80 ft. wide. The cost of construction is estimated at £80,000, and it is expected that the work could be completed within a year. The Boulogne section of the Automobile Club du Nord have also submitted a scheme to the A.C.F. relative to a proposed permanent circuit in the Pas de Calais district.

Motor-Cars for Military Purposes in France.

Official recognition of the value of the motor-car in warfare is implied by a legislative project submitted by the French Ministers of War, of the Interior, and of Public Works to the Army Commission. The scheme proposes taking a census of all automobiles in France and a classification of their details, so that in the event of hostilities the Army authorities should be able at a moment's notice to commandeer motor-cars required

Rigal at the wheel of one of the Clement-Bayard Cars for the A.C.F. 1908 Grand Prix Race. The vehicle is fitted with a four-cylinder engine 155 mm. bore by 170 mm. stroke.

of Swiss construction, the remainder being all built in France, a striking indication of the attention which is now being paid to the building of light cars in the last-named country. The entry fees for the heavy car race amount to £7,240, and for the voiturette contest £968, giving the not inconsiderable total of £8,208. The A.C.F. has definitely fixed the dates and distances for the races. The voiturette event will be held on Monday, July 6, and will consist of six circuits of the Seine Inferieure circuit, a distance of 462 kilometres, or about 288 miles. The big car race, or Grand Prix proper, will be held on the following day, Tuesday, July 7th, over ten circuits of the course, a distance of 770 kilometres, or about 480 miles. Practising has commenced on the Dieppe circuit, and already it has been found necessary to issue a warning against excessive speed.

A Proposed Permanent Racing Circuit in France.

Reference has already been made in this column to the scheme which is being considered by the French Automobile Club of establishing on some large estate a huge track on which races may be held under conditions similar to those appertaining on ordinary roads. One projected course, which is being much

for military service. The only cars exempt from mobilisation are those belonging to the President of the Republic, the Post Office, and other public departments. Fines will be imposed for non-compliance with the new law.

Miscellaneous Items.

Arrangements are in hand for the establishment of a public motor-car service between Sassari and Tempio Palua, on the island of Sardinia.—A service of motor-cabs is about to be inaugurated in Zurich by a newly-formed company.—The Austrian Automobile Club last week held a banquet in Vienna to celebrate the completion of its tenth year of existence.—It is reported that the Turkish postal authorities are contemplating establishing a motor-car service for the carriage of the mails between Fregli, on the Bagdad Railway, and Aleppo.—A motor-car race from Padua to Bovalenta, Italy, is to be held on April 5th next.—The Kaiser has ordered five Mercedes cars to be put in readiness for use during his stay in Corfu.—A hill-climbing competition is to be held on the 8th prox., over a two-kilometre course, near Toulon, France, by the Automobile Club of Toulon.

THE Santon Golf Club, which has links at Branton, Devon, is providing a motor house for the accommodation of the cars of members.

THE Brighton and Sussex Motor and Carriage Works, of 13A, Cannon Place, Brighton, have held their annual staff dinner and concert at the Grand Hotel, Brighton.

THE Maudslay Motor Co., Ltd., Coventry, have sent out a neatly designed copper ash-tray. The words "Maudslay Motors, 60, Piccadilly, W.," are stamped thereon.

UNSEASONABLE weather led to the postponement of Mr. F. Newton's attack on the world's records of 50 miles, 100 miles, one and two hours at the Brooklands track on Tuesday.

IN addition to agencies for cars, Hill's Garage in Westgate Street, Cardiff, which is managed by Mr. E. W. Bowen, carries stocks of accessories, such as the Kempshall tyres and other specialities.

A CORRESPONDENT in Moscow reports that there is an excellent opportunity for demonstrating the merits of industrial motor-vehicles among manufacturers in that district, particularly in connection with the textile industry.

As an illustration of the pains which are taken to obtain quiet and silent running in modern motor-cars, it may be stated that even radiator fans are subjected to careful balancing in order to reduce their hum to the lowest possible point.

FROM the Sheffield-Simplex Motor Works, Ltd., comes a photograph giving an interior view of their works at Tinsley, Sheffield. We recently had an opportunity of going over the new factory, and found it exceedingly well arranged and equipped for the production of high-grade cars.

HALLEY'S INDUSTRIAL MOTORS, LTD., have secured an order from the Corporation of Clydebank for a 20-h.p. fire brigade first-aid machine. The vehicle will be supplied with the usual first-aid body, suitable for carrying six men, 1,200 ft. of hose, and a 40-ft. ladder, the body generally being built to the requirements of Mr. Whyte, the firemaster at Clydebank.

THE Bridgwater Motor Co., Ltd., send a copy of their new catalogue for the season, from which their clients will be able to gauge their capacity for the prompt supply of all motor-car accessories and the numerous incidental articles required by the motorist. Among the cars illustrated are the Rover, Argyll, Swift, Singer, and other well-known makes for which the company is agent.

THE Beaufort Works and Garage at Woodhall Spa have excellent accommodation for motorists. To the main road is a showroom and above that are rooms with accommodation for chauffeurs. To the rear is a drive, paved with tar macadam, leading to a garage 50 ft. by 40 ft., and works 117 ft. by 21 ft. Messrs. Campbell and Co., the proprietors, have every facility for repairing, as well as housing, cars.

WE recently mentioned that the proprietors of the "Sheffield Daily Telegraph" had a fleet of motor vehicles for the delivery of newspapers. These vehicles are fitted with "Durandal" non-skid bands, and in order to encourage the drivers in the careful handling of their vehicles Messrs. Stuart, Morrison and Co., the agents for the non-skids, have offered a prize to the driver who has the greatest mileage to his credit with the non-skids in serviceable condition.

THE mechanical branch of the American Association of Licensed Automobile Manufacturers some time ago took up the subject of the standardisation of tubing used in motor-cars. The object of the research was to secure a high quality of steel with a maximum of strength, and to reduce the number of sizes as much as possible, so that deliveries could be more quickly made by the tube manufacturers, who have hitherto been required to supply about 1,200 sizes of steel tubes of varying diameters and thicknesses. As the outcome of the conferences that have been held the number of sizes has been reduced to about 300. Charts have been made of these standard sizes and furnished to each member of the association, giving a schedule of the standard stock sizes of all steel tubing made.

OPPOSITE the new tube station at Hampstead a garage and motor repair establishment has been opened by Messrs. Rey and Pratt.

THE Park Road Garage at Ormskirk is occupied by Mr.

J. L. Balmforth, who is well able to be of service to motorists needing assistance when in that locality.

THE R.A.C. Competitions Committee has agreed to recognise records of speed obtained when using fluids auxiliary to combustion, such as oxygen, acetylene, &c.

A PROPOSAL is to be brought before the Hampshire County Council to devote the fees received from motor-car registrations and licences to the improvement of road surfaces and the erection of warning signals.

THE Motor Repair and Supply Company, of Bridge Road, Hammersmith, W., in addition to carrying out repairs of all kinds, are now making a speciality of modernising old cars by increasing the length of the chassis to enable a side-entrance body to be substituted for the old tonneau. The two illustrations given herewith depict an old 40-h.p. Mercedes which has

recently passed through the company's hands, the first one showing its original condition and the second its remodelled appearance. The firm inform us that they can effect a similar improvement in almost any make of car, and when we called on them recently we saw a Renault chassis undergoing similar treatment.

AMONG the cars which are popular in the Colonies are the Clement-Talbot vehicles, which have lately figured in several important trials and runs in Australia. Out of six cars of this make in the three days' reliability trials held by the Automobile Club of Victoria, five were awarded gold medals. In the hill climb in connection with the same event, the three fastest times were made by the 15-h.p. Talbot cars, whilst four cars attained speeds varying from fifty to fifty-nine miles per hour in the speed test. It is on a 20-24-h.p. Talbot car that Messrs. Duddon and Auger are making an attempt to cross Australia. The last news from them recorded that they were about halfway across the Continent. Another conspicuous performance of a Clement-Talbot vehicle has been a run from Melbourne to Sydney, when Mr. C. P. Kellow, on a 15-h.p. car, covered the 577 miles in 24 h. 40 min. The ordinary train takes twenty-four hours to do the journey.

A MOTOR-CAR service has been started in Liverpool.

In the recent Bombay Trials a Daimler car secured a gold medal and made a non-stop run.

MR. J. R. ORAN, who is well known to motorists in the Highlands, has motor depots at Dingwall, and also at Tain.

MR. W. F. POOLE, manager of the Cork Motor Company, Ltd., has a prominent location in the city, and looks forward to a successful season.

MR. DUGALD CLERK, M.I.C.E., has been elected president of the Engineering Section of the British Association meeting to be held at Dublin in September next.

In the well-known Dublin suburb of Donnybrook, Mr. P. Breen has a garage with accommodation for a dozen cars and the necessary equipment for the charging of accumulators.

AMONG the orders for Siddeley 18-h.p. industrial vehicles recently secured by the Wolseley Tool and Motor Car Company, Ltd., are two for the India Office for famine relief work in India.

At the junction of the High Street and Portsmouth Road, Guildford, Mr. E. W. Steadman has opened an establishment for the sale of motor accessories. His postal address is 1, Mount Street.

MAJOR G. C. GLYN recently purchased an 18-24-h.p. Swift car, which he ran in the Reliability Trials of the South Indian Motor Union. It secured prize cups for being first in its class in (a) reliability, (b) hill climbing, and (c) speed. [Caption]

THE accompanying illustration shows the private garage of Mr. James Lawrence Breese, a well-known New York motorist. It is situated at Southampton, Long Island, Mr. Breese's summer

headquarters, where are stored and kept *au point* his three Mercedes cars—a 20-h.p., a 35-h.p., and a 40-h.p. The garage is an especially constructed building, and is equipped with every convenience for the repair of the cars.

WITH reference to Mr. Jarrott's record at Brooklands on his 80.4-h.p. (R.A.C. rating) Lorraine de Dietrich, we learn that when he had trouble with his tyre he was within four and a quarter miles of the distance standing for the hour record, with nearly ten minutes in hand.

SOME trials have lately been made with an Argyll 16-20-h.p. 2-ton petrol motor lorry in transporting cotton goods between the mill at Farnworth and the warehouse in Manchester. Starting at 7.50 a.m. the vehicle made three round trips by 5.20 p.m.; altogether the lorry carried 7 tons from the mill to the warehouse, the return journeys all being made empty.

THE Wolseley Tool and Motor Car Company, Ltd., have just supplied to the order of H.M. Office of Works a combined private omnibus or ambulance for the use of officers at the Convalescent Home at Osborne, Isle of Wight. The vehicle is built on a Siddeley chassis with chain drive and a wheel base of 11 ft. 1 in., and fitted with a 40-h.p. four-cylinder motor. When used as a private omnibus the vehicle is arranged with six bucket seats; when the car is required for ambulance work the seats can be removed and stretchers fitted in their place. The body is painted a dark green, and the seats are upholstered in dark green glazed leather. A luggage rail is fitted which is capable of carrying about 9 cwt. of luggage.

ON Wednesday next Mr. R. M. Wright, of Lincoln, will hold a motor-car auction in that city.

In the High Street, Rotherham, is a dangerous corner, at which motorists should exercise great care.

THE Soshin Motor Car Company recently inaugurated a public motor-car service in Nagasaki, Japan, with two American-built motor-omnibuses.

A MOTOR-CAR wedding at Accrington is made the subject of comment in a Lancashire paper. We had thought such events had become almost commonplace.

NEAR the King's Head Hotel, West Hill, Harrow, is the Harrow Motor Garage, where private motor houses are provided for clients. Driving is taught and all kinds of motor accessories kept in stock.

DURING last year 1,093 motor vehicles, valued at £631,433, were imported into the United States, as compared with 1,295 and £883,209 respectively in 1906. Four-fifths of the imports were supplied by France.

MR. GORDON USMAR and Mr. H. Ramoisy have joined the firm of Vinot Cars (T. J. Harman and Co., 20, Regent Street, S.W.), in partnership, and will introduce several new models, including a 12-16-h.p. (R.A.C. rating 16-h.p.) car.

SOME time ago we mentioned that a chapel on the London Road, St. Albans, had been transformed into a garage known as the City Motor and Electrical Works. This is now fully equipped, and those who travel on the main London and St. Albans road will find it possesses ample facilities for any mechanical assistance they may need.

THE Law and Parliamentary Committee of the Hammersmith Borough Council are making arrangements for holding a conference of metropolitan councils for the purpose of considering what further action it is desirable to take with a view to putting a stop to the nuisance arising from the motor-omnibus traffic. So far replies have been received from twenty-five authorities. Fourteen have agreed to send delegates to the conference, and eleven have decided not to be represented.

IN connection with the forthcoming Cordingley Motor Car Exhibition, at the Agricultural Hall, London, an aeronautical section is being organised by Messrs. Spencer Bros., the well-known aeronauts. The exhibition will be open from March 21st to the 28th, and the Aero display will include full sized airships, aeroplanes *a la* Farman, motors for flying machines, balloons, parachutes, scientific instruments, photographic cameras and other accessories, such as made the Aero Section such a popular feature at last year's show.

THE "Electary" motor appliances are attractively brought to our notice by Messrs. W. and R. Jacobs, of 39C, King William Street, E.C. These include accumulators in which a new form of incorrodible terminal is fitted, dry batteries, terminals, coils, garage lamps, combined hand and inspection lamps, switches, volt meters, and ampere meters, electric lamps, and other electrical accessories, to the excellent features of which we hope to refer in a later issue. Mention may, however, now be made of the accumulator controller, by means of which the state of the accumulator is easily ascertained.

THE start of the New York-Paris motor race took place in New York early on Wednesday, the 12th inst. The cars which started comprised three French vehicles, namely, a De Dion, driven by G. Bourchier St. Chaffray; a Motobloc, driven by C. Godard; and a Sizaire-Naudin, driven by Pons; one German car, a Protos; one Italian car, a Brixia Züst, driven by A. Scafoglio; and one American car, a Thomas, with Montague Roberts at the wheel. The race is an outgrowth of the Pekin-Paris run of last year. The route by which the cars will travel is as follows:—New York to Cleveland, Chicago, Ogden, Carson City, Mojave, Santa Barbara, and San Francisco—4,300 miles; San Francisco by ship to Valdez, 2,800 miles; Valdez to Fairbanks, Tanana, Kaltag, Unalakleet, and Nome, Alaska, 1,200 miles; Nome to East Cape, Siberia, by boat, 250 miles; East Cape to Nijni Kolinsk, Oustiana, Boulong, Yakutsk, Irkutsk, Nijni Novgorod, Moscow, St. Petersburg, Berlin, Aix-la-Chapelle, and Paris—11,450 miles. The total distance is, approximately, 20,000 miles.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.]

HILL CLIMBING IN EDINBURGH.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have perused with much interest the article in your issue of February 8th on the Sheffield-Simplex car, and I have also read the letter by Sir J. H. A. Macdonald in your issue of 15th inst. I was one of the three passengers who accompanied Mr. Percy Richardson when he drove the car from Waverley Market, via Dean Bridge, Stewart's College, Raeburn Place, Comely Bank, Stock Bridge, and Frederick Street back to Waverley Market. Perhaps you were technically wrong when you stated that Frederick Street is just under one mile in length, and although my knowledge of Edinburgh is not sufficient to enable me to make a definite statement as regards the lengths of the different streets, I am certain that from Comely Bank, where the ascent begins, to the summit in George Street the distance cannot be much, if anything, short of a mile. I have a distinct recollection of at least one bad turn on the hill. The whole route was done on top gear, and, although I have been a motorist for several years, I was surprised at the ease with which the hill was "eaten up."

an Edinburgh gentleman who went up the hill with me to ascertain the exact length and also the various names of the thoroughfares on the incline referred to.

All I can say, however, is that the facts as stated in your issue of the 8th inst. are materially true, and in order to be careful of the accuracy of the gradients, I procured from Mr. W. M. Colam, the District Engineer of the Edinburgh Northern Cable Tramways, an exact contour of the hill with the gradients marked, and with his signature appended to the same, a blue print of which I am enclosing. The turns referred to on the hill I quite admit, if met on the open road, could not be considered as awkward ones, but, considering that there are trams the whole way, and also a sufficient amount of traffic up to the second turn to necessitate serious checks in the speed of the car, so as to prevent any possibility of rushing the hill, I think it perfectly justifiable to claim them as bad turns under these conditions. As regards the details of the actual performance of climbing this hill, I may say that I started the car on its top speed at the bottom, on the slight up gradient, and had to drive the same through the traffic and invariably at the last corner there was either a tram or its equivalent in the shape of carts or

MOTORING IN THE DUTCH EAST INDIES.

A 15-22-h.p. Spyker, a 40-h.p. Fiat Touring Car and a 40-h.p. Fiat Motor Lorry at Tosari.

[De Auto.]

It would be interesting to learn if any of the other cars represented at the Edinburgh Show succeeded in accomplishing the feat performed by the Sheffield-Simplex. I saw several making the attempt. I may state that I also accompanied Mr. Percy Richardson when he drove the same car up Ramsey Lane, and I am glad to see that your correspondent gives the car credit for that performance. I have no connection with the Sheffield-Simplex Company, but I hope soon to be the owner of one of their 45-h.p. six-cylinder cars.—Yours truly,

H. L. STOCKS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice the letter in your issue of 15th inst., from Sir John Macdonald, regarding the hill climbing trial performed by me with the Sheffield-Simplex car in Edinburgh, and as I supplied the information to you, I feel it my duty to reply to the same, and in doing so would like to mention that I rather appreciate being, as it were, corrected by such a well-known and highly-respected friend.

I was evidently wrong in stating the hill climb was up Frederick Street, but not knowing Edinburgh sufficiently well, I had to rely upon the information given me by one of my passengers who I presumed knew the thoroughfare. Besides this street there are apparently other thoroughfares included in the length of the climb, and I have written to

pedestrians to prevent rushing this before coming on to the steepest part of the climb. I was very careful not only to procure the actual gradients but also to give the names of gentlemen who had travelled up with me on the car, and who were above reproach, and these names I again am taking the liberty of repeating:—The Rt. Hon. The Earl of Mar and Kellie, Mr. E. Campbell Muir, Mr. T. Barclay, Edinburgh, Mr. H. L. Stocks, Mr. Sinclair, and Mr. T. Roland Onthwaite.

Finally, I would not like Sir John Macdonald to think that I am claiming that this gradient is an exceptionally stiff one for a car to climb on one of its low gears. I am not; but what I do say is that it is a very steep gradient for a car to climb with a full load of passengers on its top gear.—Yours truly,

PERCY RICHARDSON.

[It is evident from Sir J. A. Macdonald's letter and Mr. Richardson's explanation that the hill-climbing trial in question was not merely along Frederick Street, but along a thoroughfare of which it forms part, and which changes its name at different points. The mistake does not detract from the excellent performance of the Sheffield-Simplex car, which in making the ascent of the long rise, with its maximum gradient of one in thirteen, on top gear only confirms the good opinion we formed of the hill-climbing capabilities of the vehicle in the course of a recent run from Nottingham to Sheffield.]

ARE TWO IGNITION SYSTEMS NECESSARY?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very interested in the opinions you published in the last issue of the *M.C.J.* from manufacturers and agents with regard to the question of whether it is necessary to fit two systems of ignition on modern motor-cars. Analysing the views expressed, I find that while one or two firms maintain an open mind on the subject the majority are in favour of a single system, that being—with one exception—the magneto.

Having heard the trade side of the question, it would, I think, be useful if users of motor-cars would now give their views on the subject. I would like to hear, for example, from motorists who have two systems of ignition whether they have found, in the course of their motoring career, the reserve method to be of practical use, and also to be in working order when required, and from those who rely on a single ignition whether this has carried them through safely.—Yours truly,

PRESTONIAN.

[We shall be glad to have the views of motorists on the subject as suggested by our correspondent.—ED. *M.C.J.*]

AN AUSTRALIAN DOCTOR'S EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Under separate cover I am sending you a photograph of Mrs. Grimwade and myself in my 10-h.p. Humber car. This is the second car of this make that I have driven in the last four years, during which time I have done about 35,000 miles. With the exception of tyres, I have had very little trouble on the road at all. I always drive myself, my man only cleans the car. I may also add that my wife drives the car a good deal by herself.

Until the last two years, when I came to Geelong, there were hardly any cars in the town running regularly. Now there are about a dozen, although our roads are far from good. In fact, the main road from Geelong to Melbourne, about forty-eight miles, is one of the worst, several miles of it are unmade, and for some distance one has to travel over open clay pans. In the summer this is delightful, but in the winter after heavy rain these pans are almost impassable without non-skid tyres.

As a doctor I go to all out of the way places at times, and often travel miles over mere tracks, and sometimes across paddocks without any tracks at all. I find that the car is preferable to a horse-drawn vehicle in spite of all these drawbacks, and a great saving of time.—

Yours truly,

A. SHEPPARD GRIMWADE.

Geelong, Victoria.

THE SETTING OF VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to the letter of the Larrad Syndicate, I note with regret that these people have come down to that very undesirable practice of throwing out challenges. I believe I originally started the discussion *re* valve setting in your journal, but I never had the slightest wish to either enter or be drawn into what are practically personalities. I simply stated the question as I was very interested in the extreme difference of opinion expressed by different manufacturers. I wished to see the matter discussed in an open scientific way, with the different opinions of various manufacturers expressed. When, however, I read the letter in your issue of to-day, which in so many words accuses me of untruths, and further goes on to throw out challenges, I feel sorry I started the discussion. Why cannot gentlemen treat the matter in a gentlemanly manner, and leave commercial instincts out of the question? There are one or two points worthy of note in the letter of the Larrad

Syndicate. They ask what will be the effect on various engines if the inlet valve opens 5 deg. on the suction stroke before the exhaust closes? Well, I have already told them what happened to one engine which had the valves overlapping, though, of course, I did not then take mathematical measurements (as a matter of fact the exhaust period was as near as no matter to that of the Larrad, and I should say the inlet was too), but, as they apparently do not believe the story, what is the use of telling them any more? If I tell them of other engines, and I can too, which did not run satisfactorily with the valves overlapping as per their setting, they simply say, "No, you can't prove it; our setting is right, you must be mistaken." There is no hope of scientific argument with people like this.

If I may make a suggestion as regards the ounce of fact and pound of theory, I would suggest that the finest plan the Larrad Syndicate can adopt, if they wish to prove to the motoring community that their setting is the best and absolutely infallible, is to go far and wide and set anyone's engines for them, on the strict understanding that "no cure, no charge" is the arrangement. They will find plenty of people ready to take them on, and, if they are successful every time, they will get together a very nice business. Personally, had I the knowledge which they claim to have which will prove that practically all engines are timed wrong, I should start to-morrow on my valve-setting journey and expect to reap a full harvest! About that test, I believe the Bexhill track is somewhere about a kilometre in length, with a hill at one end? Might I point out that no fair test is possible on such a track? The only really fair test is a brake test of the engines, the next best being a fifty or sixty mile run on a known road.—Yours truly,

INTERESTED ENQUIRER.

Re THE ORGANISATION OF DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Amongst the ornaments of any account on the walls of my office are the two "Special" certificates granted me by the Automobile Club of Great Britain and Ireland, now the Royal A.C. They have helped me beautifully in the course of my business, having in some cases been the turning point in my arguments with clients, who must be absolutely satisfied before coming to terms. Now I am quite sure they must be of inestimable value to the man who drives for his living, and in the meantime has charge of several hundred pounds worth of intricate machinery.

I have noticed an opinion among many men connected with the motor trade in some way or other, that these certificates are useless and not worth the trouble of getting them. Needless to say, these men have neither of the four grades of certificates issued by the R.A.C., and to the man who imagines they are the property of anyone who will pay the fees, I say, "Go in and win, if it is so easy." I think that it is one of the finest things connected with the new industry that has been accomplished, but I have always thought that there was something more wanted, and that is, the organisation referred to on the first page of the *M.C.J.*, No. 467.

I have already attempted something of the kind myself, but I came early to the conclusion that it could not be founded on anything like a substantial basis without the support of the Club itself. I should be pleased to furnish the R.A.C. with particulars of the association as I would have had it, should they intimate any desire to know. I shall also be happy to place my services and my workshops at the disposal of the R.A.C. in the interests of such an undertaking.—Yours truly,

HERBERT J. CHAPMAN.

CHANGE OF OWNERSHIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask you to kindly let me know what is done, when one buys a second-hand car, in regard to the number?

I own a car which was registered and a number given. Since then I have bought another car. I have not yet sold my first one. Shall I have to give notice to the L.C.C., and what shall I have to pay? The car I have just bought is a second-hand one, and of course has its number. I am not particular which number I have for my present car. I may add that I shall dispose of the first one as soon as possible. Further, I shall not be running same. Thanking you in anticipation.—Yours truly,

W. B.

[The point is dealt with in our Comments on another page.]

A SUGGESTION REGARDING MUD GUARDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I do not know whether you have noticed the fact that the engine under the bonnet of a petrol car is not so accessible as it was a year or so ago. As a general rule the motor adjuncts are so made that it is possible to take off almost any part without disturbing others; but this improvement of the individual parts has been in a great measure offset by the difficulty of getting at the engine as a whole. In other words, while it is easier to take the parts off when you can reach them, they are harder to reach than before, a state of affairs which has been brought about by two causes, namely, the increase in the length of the engines and the development of the wide enclosed mudguard. At present most motors are rendered inaccessible by a high radiator in front, the dash-

board at the rear, and long, wide mudguard at the side, which extend down to the frame. All work on the upper part of the engine must be done by reaching over one or the other of these obstructions, and the larger the car the farther the operator must reach. Could it not be possible to so fit the front mudguards, or in fact all of them, in such a way that they can be readily detached? The idea might be worked out in a number of different ways, and on many cars would not only materially facilitate the work of adjusting the engine, but would also be of service when tyre troubles are encountered.—Yours truly,

W. J. STEPHENSON.

THE ACTION OF SPRINGS.

To the Editor of *The Motor-Car Journal*.

SIR,—In the correspondence columns of your issue dated October 12th, Mr. A. E. Gelder, of the K.T. Syndicate, Ltd., makes the following statement:—"The rapidity of action of the best steel springs is about eighty-six times per minute, the rapidity of action of the best commercial rubber, such as is used in high-class tyres, is about ninety per minute, but the rapidity of action of air is approximately 1,800 times per minute." Is it too much if I ask Mr. Gelder by your favour to explain through the medium of the *M.C.J.* (1) what he means by the phrase "rapidity of action"? and (2) how does he get, or who is his authority for the particulars quoted?—Yours truly,

Melbourne.

J. E. BISHOP.

THE IRISH RELIABILITY TRIALS.

THE itinerary of the trials to be organised by the Irish A.C. in May next will be as follows:—

First day.—Dublin to Portrush, 149½ miles.—Dublin, Balbriggan, Drogheda, Dunleer, Dundalk, Newry, Banbridge, Lurgan, Moira, Crumlin, Antrim, Ballymena, Ballymoney, Portrush.

Second day.—Portrush to Dublin, 173 miles.—Portrush, Coleraine, Downhill, Limavady, Dungiven, Maghera, Tobermore, Moneymore, Cookstown, Dungannon, Moy, Armagh, Keady, Oastleblayney, Carrickmacross, Ardee, Collon, Slane, Dublin.

Third day.—Dublin to Killarney, 178 miles.—Dublin, Rathcoole, Kill, Johnstown, Naas, Newbridge, Kildare, Monasterevan, Ballybrittas, Ballydavis Cross Roads, Ballyroan, Abbeyleix, Durrow, Johnstown, Urlingford, Littleton, Cashel, Goldenbridge, Tipperary, Emily, Knocklong, Kilmallock, Charleville, Freemount, Newmarket, Boherboy, Killarney.

Fourth day.—Stay at Killarney.

Fifth day.—Killarney to Cork, 156½ miles.—Killarney, Beaufort, Kilgobnet, Lough Acoose, Ballochoheen, Spunkane Chapel, Waterville, Top of Coomakista, Derrynane, Cahirdaniel, West Cove, Parknasilla, Blackwater Bridge, Templemore, Kenmare, Glengariffe, Ballylicky Bridge, Pass of Keimaneigh, Tarn to Gougane Barra, Bealnagarry, Inchigeela, Toon Bridge, Macroom Bridge, Carrigadrohid, Coachford, Dripsey, Iniscarra, Carrigrohane, Cork.

Sixth day.—Cork to Dublin, 161½ miles.—Cork, Glanmire, Watergrasshill, Rathcormac, Fermoy, Kilworth, Ballyporeen, Clogheen,

A Road to the Soudan.

The town of Eneh is a provincial capital of Egypt, with a road leading to the Soudan, along which a considerable trade is done. It provides an object lesson in the progress that is taking place in Egypt.

From "*The Mediterranean*."

[George Philip and Son, Ltd.]

MESSRS. HARPER AND LANE, Granby Street, Leicester, agents for the Humber cars, write us in regard to a paragraph which appeared in this column last week, that it is the chief constable of Leicestershire who has been provided with a 15-h.p. Coventry-Humber car. The vehicle which was supplied by them has given every satisfaction, and proved to be of great value to the chief constable during the recent series of burglaries, &c., in Leicestershire.

BARON ADRIEN DE TURCKHEIM, of the De Dietrich Company, has written to Mr. W. M. Letts with regard to the prohibition of detachable wheels in the A.C.F. Grand Prix Race, stating that he considers "that the Sporting Commission of the A.C.F. could not reverse a decision which has already been made some considerable time, and which has been adhered to in previous races: but, on the other hand, and from a purely sporting point of view, I think it would have been interesting to see Mr. Edge's car run against ours, even with the detachable wheels, we, ourselves, not having them."

MR. W. E. GELDER, secretary of the Chauffeurs' Commercial Motor Men, 71, Horatio Street, Moston, Manchester, writes to say that at a meeting of his society it was resolved that Mr. Councillor T. Fox should ask the Chief Constable of Manchester if anything could be done towards securing instruction in driving before granting licences to drive cars. The reply was that the Chief Constable had no such power. Mr. Gelder also adds that he did not know of the views of the Chief Constable as expressed to the L.G.B., a point raised by the Chief Constable of Manchester at the opening of the recent Manchester Motor Show.

Ardfinnan, Clonmel, Glenbower, Nine-Mile-House, Callan, Kilkenny, Royal Oak, Leighlinbridge, Carlow, Baltinglass, Hollywood, Poulaphuca, Blessington, Brittas, Embankment, Tallagh, Balrothery, Templeogue, Terenure, Dublin.

THE INTERNATIONAL TOURING CAR TRIAL, 1908.

THE following entries have already been received for this trial, which begins on Thursday, June 11th next:—

Class 7.—Six-cylinder Napier, entered by Mr. S. F. Edge.

Class 9.—Six-cylinder Rolls-Royce (2), entered by Messrs. Rolls-Royce, Ltd.

Class 10.—Six-cylinder Napier, entered by Mr. S. F. Edge.

Class 3.—De Dion car, entered by Mr. J. W. Stocks.

Classes 5 and 6.—Beeston-Humber cars, entered by Mr. T. C. Pullinger.

Class C.—20-h.p. and a 30-h.p. White steam car, entered by Mr. F. Coleman.

The ten classes are based on R.A.C. rating, as follows:—Up to 6.4, from 6.4 to 13.0, from 13.0 to 16.0, from 16.0 to 20.8, from 20.8 to 25.6, from 25.6 to 32.4, from 32.4 to 40.0, from 40.0 to 46.4, from 46.4 to 52.8, from 52.8 to 60.0.

THE correspondent who wrote last week with reference to the police trap at Crawley now informs us that the police stand between the buildings named and not behind.

DEPUTATION TO THE CHANCELLOR OF THE EXCHEQUER.

On Tuesday a deputation from the Motor Union waited upon the Chancellor of the Exchequer at the House of Commons. It consisted of Mr. Joynson-Hicks, Captain D. Hughes Morgan, J.P. (Cardiff), Messrs. Chas. H. Dodd (Maidenhead), W. Ballin Hinde (hon. treasurer), Major J. A. Cole, J.P. (Sleaford), Col. Howard Fairtlough (Godalming), A. Lyle Rathbone, J.P. (Liverpool), W. Jackson (Liverpool), J. E. Hodgkin (Newcastle), C. P. Wilson (Leeds), P. A. Sharman (Hitchin), H. J. Wells (Barnsley), Walter Bourke (Maidenhead), Earl Russell (London and Chichester), C. McWhirter (Herts), P. Runciman, Dr. J. L. Lock, M.A. (Uxbridge), Rev. F. W. Hassard-Short, (Cardiff), H. Howard Humphreys, M.I.M.E. (representing Commercial Motor Users' Association), Rees Jeffreys (secretary).

Mr. Joynson-Hicks submitted that any increase in motor-car taxation should in any event be moderate, and that the interests of motorists of moderate means should be specially considered. He pointed out that to specially tax motorists as road-users would be to revert to the obsolete principle of the turnpike. He urged that (a) Such taxation should not be inequitable as compared with the taxes on other classes of road vehicles. (b) That no taxation should be imposed that would materially restrict the use of motor vehicles or confine their use and enjoyment to the comparatively wealthy. (c) Motorists should not be called upon to pay several times over for the maintenance of the roads they use. The great majority of motorists are house occupiers and therefore ratepayers. In the capacity of ratepayers they are already contributing through the ordinary channels to the maintenance of public highways. Those of them who are income tax payers again contribute to the Imperial grants in aid of local taxation towards road maintenance. It would be grossly unfair to make them contribute to a large extent through a third channel for the same objects. The question was, Are the roads to be paid for by the users of them, or are the roads to be considered as general thoroughfares to be supported by the State for the benefit of the people as a whole. Mr. Hicks went on to urge that any new taxation should be calculated according to the weight of the vehicle, and not on any horse-power formula. He entirely concurred in the recommendation of the Royal Commission that taxation should be levied on the basis of weight. The Union proposed that the responsibility should be placed upon the chassis maker and carriage builder to stamp the weights of the chassis and body upon their respective productions, and upon the user of the car to return the sum of these weights to the proper authority. The Motor Union, provided that monies derived are appropriated for highway purposes, as previously indicated, would acquiesce in a scale of taxation as suggested below:—

(a) Motor-cars unladen:—

Motor-bicycles weighing less than 2 cwt., 7s. 6d.

Motor-cycles weighing less than 7 cwt., 15s.

Motor-cycles and motor-cars not exceeding 12 cwt. unladen, 30s.

Motor-cars exceeding 12 cwt. and not exceeding 15 cwt., £2.

Motor-cars exceeding 15 cwt. and not exceeding 20 cwt., £3.

Motor-cars exceeding 20 cwt. and not exceeding 25 cwt., £4.

Motor-cars exceeding 25 cwt. and not exceeding 30 cwt., £6.

And £2 for every additional 5 cwt.

Trade and public service motor vehicles to pay 5s. per ton of registered axle weight.

(b) Horse-drawn vehicles:—

2-wheeled, drawn by one horse, £1.

4-wheeled, drawn by one horse, £2.

4-wheeled, drawn by two horses, £4.

4-wheeled, drawn by more than two horses, £6.

Trade and public service vehicles to pay half the above rates.

The speaker went on to remark that the Royal Commission recommended that revenue derived from the taxation of motor-cars should be devoted to the improvement of roads, and that a central department should direct the allocation of the moneys raised.

Mr. Asquith remarked that he did not think a Chancellor of the Exchequer would get any profit out of such a transaction at all. He would incur the odium of creating a new and expensive department, and that having paid the costs of the thing the department would hand over the profits of the tax to the various local authorities. He did not see much advantage to the Chancellor of the Exchequer in that.

Mr. Howard Humphreys referred to the question of the basis upon which the taxation should be made. They advocated that it should be on the basis of weight and not horse power. The latter could not be rightly applied to steam vehicles. In the case of other motors there were different types of engines which gave different rates of efficiency. The proposal of the Royal Commission would press unfairly on both pleasure and trade cars. The deputation suggested that trade and public service vehicles should pay 5s. per ton of registered axle weight.

Earl Russell, having spoken on the general principles of taxation, said it was now stated that it was proposed considerably to increase the tax payable by motor-cars and that these taxes should be proportioned in some way to the size and magnificence of the car. Such an increase based upon considerations of weight was recommended by the Royal Commission, while other persons who ignorantly thought that horse power was as easily ascertainable as pounds avoirdupois had occasionally supported a taxation graduated on this basis. If it was taken on the

basis of luxury, and it was said that persons who owned two or three cars of 30-h.p. and upwards could well afford to pay a licence of £10 per car instead of 4 gs., he admitted that that was probably true. To precisely the same extent it was true that those who employed powdered footmen could probably afford to pay £5 a head for them instead of 15s. But it was perfectly clear that in all these cases there would always be a limit line where the additional tax will press hardly. A 30-h.p. motor-car costing from £500 to £700, and which could be run fairly inexpensively by the man who drove it himself, might well be used by a superior commercial traveller for the purpose of his business, but to him an additional £5 or £6 a year in taxation would be quite a serious consideration. Another still more specious argument most frequently used, was that motors, while damaging the roads in excess of other classes of vehicles, escaped their fair share of taxation and did not contribute enough to the upkeep of the roads. He denied the premises and said that if all the roads of the country were taken, far more damage was done to them by farm carts and in some cases by traction engines, than by all the motor-cars. If all the owners of motor-cars in the kingdom were tabulated it would probably be found that they paid a larger sum per head in rates and taxes than any other single class of persons outside the House of Lords. The suggested reason was that those who used and damaged the roads should pay proportionately for their upkeep. This was exactly the reasoning which obtained when the country was permeated with toll gates, at each of which tribute was levied on passing vehicles on a scale proportioned to the damage they were supposed to have done or the benefit they had had of the road. This system had been condemned and abolished. Motorists were therefore entitled to say that this system of charging for the use of the roads was an obsolete and a discredited system. They were entitled to contend that if this was the ground on which increased taxation was to be imposed on motor vehicles the reasoning should be extended to all other classes of vehicles, and that a commission should sit to enquire what was the proper contribution to exact towards road making from all vehicles that use the roads.

The Rev. Hassard Short submitted that motor-cyclists were already overtaxed in comparison with pedal cyclists and motor-car owners.

Dr. Lock spoke of the unfairness of a system under which a medical man, after giving up his horse and carriage for a motor, would be called upon to pay considerably increased taxation. The Chancellor of the Exchequer said he was much obliged to the deputation, whose case would have due consideration.

AUTOMOBILE ACCIDENTS.

In the Westminster Court Mr. Troutbeck held an inquiry with reference to the death of John Ash, who was fatally injured by a motor-car in Kensington Gore. Mr. Isaac McGieham stated that he and his wife were walking along High Street, Kensington, where a great many motor-cars were being driven at a very rapid pace. He saw the deceased man come out into the road, and he was struck by the wheel of a motor-car, which was nearly in the centre of the road, and was evidently in the act of passing a cab. He heard the chauffeur shout very loudly. The vehicle was not pulled up within its own length, and he had not heard the hooter sounded. P.C. Gilderspoke of taking Ash to St. George's Hospital, where he was found to be dead. To witness the driver said, "I was coming from High Street, Kensington, at eight miles an hour, when the man came from behind a hansom cab. I shouted and applied my brakes. The jury returned a verdict of accidental death, and said they thought the chauffeur should be severely cautioned.

At the City of London Court, Dr. F. J. Waldo concluded an inquiry with reference to the death of James Garner, steward of the Press Club, Wine Office Court, E.C., who was run over and killed by a Vanguard motor-bus in Fleet Street on the 6th inst. Herbert Allen, who witnessed the accident, said that Mr. Garner in crossing the road passed behind a four-wheeled van going west, and got right in front of the motor-omnibus, which was going east. The speed of the bus was about six miles an hour, and the driver had no opportunity of averting an accident. Mr. Garner fell, and both near-side wheels went over him. The driver at once applied his brakes. The jury returned a verdict of "Accidental death," and exonerated the driver from all blame.

An accident occurred to a man named Charles Stocks, at the Cinque Ports Hotel, Rye, on Sunday morning. He was trying to start a motor-car, and was holding the starting handle, when the engine back-fired. The force threw him upon the lamp bracket, the spikes of which pierced his forehead above his eye. The unfortunate man was rendered unconscious. At seven o'clock on Monday evening he was still unconscious, and his condition was about the same.

The coroner at West Bromwich has held an inquest relative to the death of a cyclist who collided with a motor-car and sustained injuries from which he died. Several witnesses gave evidence and the jury returned a verdict of accidental death, adding that no blame could be attached to the driver of the car.

THE Stepney spare wheel gave Mr. W. T. Lord a feeling of confidence on his recent trip from Bombay to Calcutta, and now Mr. H. Dutton, who is attempting the journey across Australia by motor-car, is stipulating that his automobile shall be fitted with Stepney wheels.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

TWENTY-ONE provincial automobile clubs have decided to remain affiliated both to the Royal A.C. and to the Motor Union during 1908. To the members of these clubs, and those which have not yet decided, the Royal A.C. proposes to offer the full advantages of associateship of the R.A.C., including the use of its legal department and the services of its legal adviser, and the use of the premises at 112, Piccadilly, which have been provided as a London address, &c.

The first meeting of the newly-constituted R.A.C. general committee has now been convened. It was to meet at 119, Piccadilly, W., on Wednesday, the 19th inst., at 5 p.m. The clubs that have notified their decision to become associated with the R.A.C. have been invited to nominate representatives to the committee, and a similar invitation has been sent to the clubs that have decided to retain affiliation to the R.A.C. and the Motor Union during 1908, under their old agreements.

The premises taken for the members of clubs associated to the Royal A.C., and for the individual associates, are being opened this week. These premises are easily found, being situated at 112, Piccadilly, only seven doors from the R.A.C.'s Club House, whilst one of the R.A.C.'s motor houses is four doors away in the other direction. The windows look out over the Green Park towards the gardens of Buckingham Palace. Accessibility is a strong point as regards the building, for the Down Street Station on the Piccadilly-Brompton Tube Railway is within half a minute's walk.

As reported last week, the representatives of certain provincial automobile clubs recently asked the R.A.C. to receive a deputation on the subject of the differences existing between the R.A.C. and the Motor Union. The Club cordially acceded to the request, and the deputation duly attended. It was composed of the following:—Mr. A. Armitage, J.P. (Somerset A.C.), Mr. R. W. Buttemer (West Surrey A.C.), Mr. T. W. Grace (Manchester A.C.), Mr. Sidney F. Harris (Northants A.C.), Mr. J. E. Hodgkin (North-Eastern Automobile Association), and Mr. H. A. Watson (N. Yorks A.C.). A committee had been appointed on behalf of the R.A.C. to meet them, and the following were present:—Mr. C. D. Rose, M.P. (chairman), Prof. Vernon Boys, F.R.S. (vice-chairman), Col. H. C. L. Holden, R.A., F.R.S. (ex-chairman), the Hon. Arthur Stanley, M.P., M.V.O. (ex-chairman), Mr. T. H. D. Berridge, M.P., Mr. J. R. Nisbet, Sir Boverton Redwood, D.Sc., Mr. Robert Todd, Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, and Mr. Alexander Ure, K.C., M.P.

THE AUTOMOBILE ASSOCIATION.

THE band of H.M. Coldstream Guards will be one of the attractions at the Automobile Association's third annual dinner, which will take place at the Hotel Cecil, London, on the 18th prox.—a few days prior to the opening of the Spring Motor Show.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

A MEETING of the Committee of the London Branch of the Graduated Section of the Incorporated Institution of Automobile Engineers was held on the 11th inst., representatives being present from Clement-Talbot, Ltd., Hutton, Ltd., Simms Manufacturing Company, Ltd., St. James's Electric Light Company, Regent Street Polytechnic, Armstrong-Whitworth and Co., Ltd., the Motor Manufacturing Company, Ltd., Acer, Ltd., Royal College of Science, Dennis Bros., Milnes-Daimler, Ltd., and the University College. Mr. L. H. B. Cosway has been appointed hon. secretary *pro tem.*, and Mr. F. Thomas chairman *pro tem.* No time has been lost in preparing for the present session, and already papers have been promised for the remainder of the session to be read at the monthly general meetings. The first is by Mr. L. H. B. Cosway, entitled "Methods of Testing a Motor-Car," and will be read on Tuesday next, at 8 p.m., at 1, Albemarle Street, Piccadilly, W.

Particulars of membership of the Graduates' Section of the Institution may be obtained on application to the hon. sec., Mr. L. H. B. Cosway, 6 (Engineers') Quarters, H.M. Prison, Wandsworth, S.W., or of the secretary of the Institution, Mr. Rees Jeffreys, 1, Albemarle Street, Piccadilly, London, W.

AUTO-CYCLE UNION.

ON Saturday the Auto-Cycle Union held its fifth annual dinner at the Hotel Cecil, London. Colonel H. C. Holden, R.A., presided, and was supported by Messrs. J. W. Orde, J. Lyons Sampson, Robert Todd, A. J. Wilson, J. Van Hooydonk, A. G. Reynolds, W. G. Williams, C. A. Smith, H. A. Collier, Stenson Cooke, C. R. Collier, Dr. Hele-Shaw, F. Straight (secretary, A.C.U.), and many others.

The chairman (Colonel Holden), in proposing the toast of the evening, "The Auto-Cycle Union," stated that since their last dinner they had changed their name from the Auto-Cycle Club to that of the Auto-Cycle Union. He remarked on the great advantages of the motor-cycle for the active man, which had all the merits of the motor-car and none of its drawbacks. This made it in some respects the most wonderful outcome of the motoring movement. The union was

fortunate in having its affairs controlled by such able officers and officials, and in Mr. Robert Todd they had the best of all chairmen.

Mr. ROBERT TODD, in reply, could hold out little hope for reduced taxation for the motor-cyclists, but the work of the Union was to see that this was kept as low as possible. He was able to state that the affairs of the Auto-Cycle Union had now got to the stage of work instead of talk, as well as being at peace with all kindred bodies.

The toast of "The Affiliated Clubs" was proposed by Mr. Julian Orde, who spoke at length of the sphere of usefulness of the Union, remarking that there were no less than 2,100 members therein. These would no doubt induce all the great number of members of motor-cycling clubs and riders at present unattached to join the union.

Mr. R. H. HEAD (chairman of the Motor-Cycling Club) replied, stating that his club was one of the staunchest supporters of the union, and hoped long to be associated with it in its good work for the benefit of the individual as well as the pastime. Mr. A. Carpmael (Richmond District M.C.) also replied.

NORTH-EAST LANCASHIRE.

AT the sixth annual dinner of the North-East Lancashire A.C., held in the Town Hall, Blackburn, last week, ladies were invited, and the company numbered close upon 120. Mr. W. Birtwistle, the president of the club, presided, and, after the loyal toasts, Major F. G. Hindle proposed "Our Guests." Though they might consider the laws placed on them as motorists much too strict, whilst it was the law of the land he (Major Hindle) was sure they would try to act loyally and obey it. They had an organisation whose principal object was to discourage reckless driving, though at the present time they were

The 80-h.p. Six-Cylinder Napier just delivered by Messrs. S. F. Edge, Ltd., to Captain C. E. Hamilton, of Great Somerford, Chippenham.

The car is claimed to be not only the most powerful, but by far the fastest genuine touring car in the world. The dimensions of the cylinders are 6½ in. bore by 5 in. stroke. The car is rated as 93.7-h.p. (R.A.C. rating). The body, built by H. J. Mulliner, of Northampton, has an innovation, the doors being hinged to the front, so that should a door be left open it will close itself automatically as the car moves off. The vehicle is painted in cream picked out with green, and finished with green upholstery.

passing through a troublesome period. They all knew of the dissensions which had taken place, and he was sure they all hoped that a satisfactory decision would soon be arrived at. The club had had a committee appointed in regard to the roads. He was glad to say that they had had many interviews with the road authorities and he believed some improvements had taken place, and were to take place, which would not only be appreciated by motorists, but by all who used the roads. Mr. Smitton responded on behalf of the guests. The final toast was "The Chairman," proposed by Dr. Stephenson, who coupled with Mr. Birtwistle's name that of his son, Mr. A. Birtwistle, the club secretary. In response the president said he was always willing to do what he could for the club and its members, and he thanked them for the toast.

Amid applause for the respective recipients, the Mayor of Blackburn (Mr. F. T. Thomas) then presented the following prizes to members of the club. Silver cups, for absolute non-stops in the club's run to Callender and back:—Mrs. T. M. Crook (car driven by Mr. Hodgson); Mr. A. S. Bury (Accrington); Mr. A. E. Crowdy (Manchester) (car driven by Mr. T. A. Garnett); Mr. F. Birtwistle; Mr. Stafford, and Mr. A. Birtwistle.—Gold medals for open hill climb on Rimington Pike:—Mr. A. E. Crowdy; Mr. W. D. Coddington (two medals), and Mr. F. Birtwistle (three medals). Several other medals in connection with the competition had been presented previously.—Motor Union medal (Motor Gymkhana):—Mr. J. Robinson (Preston).—The last prize was a handsome silver cup, presented by Mrs. T. M. Crook, for the best performance on formula in the members' open hill climb, and this was won by and presented to Mrs. A. E. Riley, of Haslingden.

HARTLEPOOLS.

THE membership of the Hartlepool A.C. now stands at fifty. When the members met at the Grand Hotel, West Hartlepool, on Thursday of last week, the familiar sound of the motor horn was frequently heard, and the proceedings were of a most interesting character. Mr. Geo. Jones, J.P., presided, and amongst others present were The Mayor of West Hartlepool (Alderman Robson), Mr. H. C. Pyman (hon. secretary), Mr. J. Natras (hon. secretary Stockton Automobile Club).

After the loyal toasts Mr. C. E. Smith proposed "The Visitors."

Dr. Macgregor submitted "The Hartlepool Automobile Club," referring to the developments of the motor industry. Speaking of the progress of the club, he said the increase in the membership proved that it had been very successful. The Chairman, replying, said that the club had been very successful during the year, and had established a good record, because none of the members had been before the magistrates. It was undoubtedly a model club, and the members were most considerate to others they met on the road. Much of the success depended upon the hon. secretary, and in Mr. H. Pyman they had a gentleman who took a great interest in the club, and in all matters appertaining to motoring.

BASINGSTOKE.

MR. GEO. WATSON'S lecture on "Steam Road Vehicles" before the Basingstoke and District Motor Club proved very interesting to a good attendance of members last Saturday, the 15th inst. Mr. Robinson, of Wallis and Stevens, occupied the chair, and in introducing the lecturer

they can display to advantage. Ten in number, the rules are printed in bold type on durable board, and are bound to attract attention wherever exhibited. The headings are:—Taking Corners, Main Road Traffic, Signals, Meeting or Overtaking, In Traffic, In Descending Hills, The Horn or Bell, When Pulling Up or Stopping, Accidents, Avoid Splashing Pedestrians with Mud.

Arrangements have been made with the following railway companies for the issue of passenger tickets as far as Paris, and for the booking of cars across the English Channel:—South-Eastern and Chatham, Folkestone-Boulogne; London, Brighton and South Coast, Newhaven-Dieppe; London and South-Western, Southampton-Havre.

LADIES.

ON Wednesday of last week Mr. R. Sedgwick Currie delivered his third technical lecture at the Ladies' A.C. The subject was "Old and Modern Types of Ignition and Carburettors." Practically every known method of ignition was dealt with, from the early tube ignition, the catalytic, the coil and accumulator and modern distributor to the present high and low tension magneto. The windings of the latter and the method of construction were carefully explained, and then Mr. Currie told how the electric current was produced. Next carburettors and carburation were lightly dealt with, but as the time was short, further discussion on this interesting subject was postponed to the fourth lecture. A great number of ignition specialties were kindly supplied to the club by the following firms:—Messrs. the United Motor Industries, G. T. Riches and Co., Simms, Panhard and Levassor, the Itala Automobiles, and Vandervell and Co.

Motor Wagons in the Austrian Army.

The Austrian War Office have lately established works at Klosterneuburg for the repair of the motor vehicles employed in connection with the Austrian Army. The above illustration depicts one of the vehicles with which some trials are being made as to the best type of tyre for military motor lorries. [Allgemeine Automobil Zeitung.]

mentioned the difficulties placed before the pioneers of steam traction engines in this country. The lecture included lantern illustrations of mechanically propelled vehicles existing 2,000 years ago, one of which was worm driven, although, as Mr. Watson stated, it was not a Dennis. Early Hancock, De Dion and other vehicles were described, and those in the Liverpool Trials were of special interest, as Mr. T. Baker, who was present, drove the Thornycroft vehicles which won prizes on those occasions. The Serpollet cars were fully described and a favourable future for steam vehicles foretold by Mr. Watson.

Mr. T. Baker was called upon to give some of his experiences. Mr. Baker, in proposing a vote of thanks to the lecturer, said he was still in favour of steam, although petrol and paraffin occupied him nowadays.

After the other usual votes of thanks to chairman and lantern operator were passed the hon. secretary, Mr. R. K. Hubbard, reported that the danger notice board on the London road entrance to the town would be erected by the 22nd inst., and that the subscription for purchase of a second-hand lathe had been started with a donation of 10s. 6d. from the president, Mr. H. Niblett. The question of affiliation to the Autocycle Union was raised but was not voted on owing to the small number of motor-cyclists present.

THE MOTOR UNION.

A THOUSAND copies of Rules and Courtesies of the Road are being distributed to affiliated clubs, hotels, and motor houses, and Secretaries are invited to make application for any special number of copies which

SOCIETY OF MOTOR MANUFACTURERS AND TRADERS.

THE secretary attended the first meeting of the newly-formed South-Western Section at Yeovil. Mr. J. H. Boll (Messrs. Hill and Boll, Yeovil) was in the chair. A first committee was formed as follows, with power to add to their number:—Mr. J. H. Boll, chairman; Mr. M. H. Tilley (M. H. Tilley and Son, Dorchester), vice-chairman; and Messrs. H. B. Petter (B. and H. Petter, Motor Company, Yeovil), Allen, jun. (Allen and Son, Taunton), Conyers (Blandford), Carver (Bridgwater Motor Company, Bridgwater), and Strickland (Gillingham). Mr. E. H. Fletcher (of Messrs. Denman and Fletcher, chartered accountants, Bank Chambers, Yeovil) has been elected secretary.

The secretary of the society attended a meeting of the agents at the St. James' Hall, Manchester, on February 10th. Mr. W. M. Letts chairman of the committee of the Agents' Section, presided, and was supported by Mr. Tom Garner, chairman of the Lancashire and Cheshire section. This new official, who has been appointed to supervise the organisation of these centres, is Mr. J. S. Stafford.

A 100-MILES reliability trial will be held this year by the Walthamstow M.C.

THE Hotel Portland, Chesterfield, is the headquarters of the Chesterfield and District M.C.

MR. W. J. WILSON, 2, Hergentfelt Villas, Sussex Road, Sidcup, is the hon. secretary of the Cray Valley Cycle and Motor Club.

CASES UNDER THE MOTOR CAR ACT.

RECKLESS DRIVING.

At the Drogheda Petty Sessions, George Durnin, chauffeur in the employment of Captain Taaffe, Smarmore Castle, Ardee, was charged with recklessly driving a motor-car through the town on January 21st, and in a manner dangerous to the public. He was further charged with failing to stop the car when signalled to do so. A fine of £1 was imposed, and Captain Perry, R.M., said he hoped the other motorists who drove at a high rate through the town would be prosecuted, as it would be in the interests of the public and the motorists themselves.

A HAUL AT KINGSTON.

Eight motorists were summoned at Kingston, on the 13th, for exceeding the legal limit. The fines aggregated £39.

Four others were fined sums of £2 and £3 for exceeding the ten mile speed limit in Richmond Park.

A DISMISSAL.

Curling Hunter, of 6, Westbourne Terrace, W., was summoned for driving to the danger at Esher, on January 12th, and with refusing to stop his car when requested by a constable. P.S. Stringer said he timed the car, and found it to be travelling at thirty miles an hour, and as it passed him he took down the number, "K. 70," which he saw distinctly. P.C. Matthews said he also took the number, and had not the slightest doubt about it. P.C. Hibberd said he knew the car well. An independent witness, who was cycling, said, owing to the speed of the car, he also took the number, and gave it to the police at the time. Defendant went into the box, and declared that the car was not in Esher on the day in question, and he called his wife, his son, and two other witnesses to corroborate his statement. Mr. G. C. Sherwood, who appeared for the defence, said it was clear that the police had made a mistake, and that some other motorist had been using the defendant's number. The chairman said the Bench were satisfied that the police took the number correctly, but they thought the defendant was not the driver of the car, and they accordingly dismissed the summons.

AN ENDORSEMENT QUASHED.

In the Divisional Court, on the 12th inst., before the Lord Chief Justice, Mr. Justice A. T. Lawrence, and Mr. Justice Sutton, an application was made in *Moffat v. the Northfield Justices* for a rule absolute to quash the justices' endorsement upon the licence of Mr. Moffat, made in respect of a conviction under Section 72 of the Highways Act, 1835, for obstructing High Street, Bournbrook, Worcestershire, on July 27th, 1907, by allowing a motor-car to remain there for forty-five minutes. Mr. Horace Avory, K.C., briefed at the suggestion of the Motor Union, appeared for the appellant, and argued that an offence under the Highways Act could not be made an offence under the Motor-Car Act. It was only in respect to the latter Act that endorsements could be made on a licence. The Court made the rule absolute to quash the endorsement.

EXCEEDING LEGAL LIMIT.

On Saturday fines of £5 with costs were imposed on five motorists at Croydon; fines of similar amount were also inflicted on three motorists at Grantham.

NO LIGHTS.

At the Shoreham Petty Sessions, Claud Warren, of the Palmeira Motor Works, Hove, summoned for not having the rear identification plate of his motor-car illuminated during prohibited hours, at Southwick, on February 2nd, stated that this was due to the fact that one of the accumulators had run down. P.C. Brett related the facts, and defendant had to pay 6s. costs, no conviction being registered.

ROAD REPORTS.

LLANDAFF AND DINAS POWIS.—Mr. James Holden, the surveyor to the rural district council, has presented a report on the results of experiments in connection with road-making. The experiments were carried out on Pencisely road, over a piece of road 860 ft. long, and with an average width of 20 ft. Upon the surface of the old road was placed a layer of small stones $\frac{1}{2}$ in. in size coated with a special preparation of tar. Over this layer Cleve Hill road metal was spread and rolled slowly, the slow process of rolling enticing rather than forcing the underlayer to penetrate upwards through the voids, abolishing altogether the old binding of gravel and water. The experiments were carried out last August, and Mr. Holden reported that nothing had since been spent in maintenance on this particular portion of the road, and that it created neither dust nor mud.

GIFFNOCK.—At the meeting of the District Committee of Upper Renfrew, a letter was read from Giffnock directing attention to the excessive speed of tramway and motor cars on the Kilmarnock road through that village, and the clerk was instructed to write the Glasgow Corporation Tramways Department, informing them of the complaint, and requesting that the drivers of tramway cars be cautioned not to exceed the authorised speed limit on Kilmarnock road. Regarding the complaint as to motor-cars, it was agreed to request the Automobile Club to provide two of their caution boards, to be erected on the side of the road at Giffnock in positions to be arranged with the road surveyor.

BARNSELY.—Care should be taken when passing along the main road from Barnsley to Penistone between Dodworth and Silkstone Common, owing to a depression caused by colliery workings. The main road through Silkstone to Hoylandswaine is suggested as an alternative route by Mr. J. H. Taylor, the Borough Surveyor.

HAMPSHIRE.—The "Hampshire Chronicle" continues to publish lists of roads under repair. These include the road leading from Christchurch to Wimborne through Holdenhurst district, the Fareham, Droxford, and Alton main road at Warnford, Winchester, and Morestead, and the road from Christchurch to Fordingbridge.

EAST SUSSEX.—The estimate for the repair of roads in East Sussex has increased this year by over £1,700, and the County Council have been informed by their surveyor that the increase is mainly due to the extra wear and tear on the principal roads caused by the studded or armoured tyres of motor-cars. He cited an instance of this on the London and Brighton main road, where there were perceptible tracks on a section of that road which had been prepared with Queenast stone last season. The main roads between Rottingdean and Brighton, Hurst Green and Flimwell, Hassocks and Albourne, and Eastbourne and Wilmington, are under repair.

THE COURTESIES OF THE ROAD.

WILLIAM ROBINSON, carman, has been summoned at West London police court for driving on the wrong side of the road. Mr. Basil H. Thomson, governor of Wormwood Scrubs Prison, said he was driving his motor-car along Ducane Road, when he came upon the defendant's cart in the middle of the road. The defendant was thirty yards behind the cart, and when the witness blew his horn he merely laughed, and made no attempt to pull his horses on one side. A passing postman performed that service, and the witness was thus allowed to go on his way. The defendant, who said there was room on either side of his cart for the motor-car to pass, was fined 18s., with 2s. costs.

Two views of the 35-h.p. Dennis Car recently delivered to Mr. Charles Campton, of The Nook, Tudor Road, New Barnet. As will be seen, the rear part of the body is made detachable, converting the car into a speedy touring vehicle for two persons.

INLAND REVENUE.

MR. W. H. BERRY, Clissold Road, Stoke Newington, was summoned by the excise authorities, before Mr. d'Eyncourt, at the North London Police Court, for keeping a carriage, on September 26th last, without a licence.

Francis MacMahon, an excise officer, said that he found the defendant in possession of, and using, a motor-car which was registered in the previous April. He admitted that he had no licence from the excise, but said that he was registered and licensed by the London County Council, and he thought that was all that was necessary. The solicitor who appeared for the prosecution said that it was necessary for a person within twenty-one days of becoming the registered owner of a motor-car to take out an excise licence. The defendant now repeated that it was a genuine mistake. He was under the impression that his payments to the County Council covered the licence. He took the licence out after the officer called, but shortly afterwards disposed of the car. Mr. d'Eyncourt said that many people were under the misapprehension that the County Council licence covered a motor-car. It seemed to be a slip in this case, and he should only impose a nominal fine of 5s. with 2s. costs.

The representatives of the Kent A.C. on the General Committee of the Royal A.C. are Dr. C. Firth, Capt. S. H. Page, and Mr. G. M. Kenyon.

FORTHCOMING EVENTS.

FEBRUARY.

- 24th (M.).—Motor Show opens at Bcmhay.
 26th (W.).—Prof. H. S. Hele-Shaw and Mr. Douglas Mackenzie will read a paper on the "Problem of Road Construction" before the Society of Arts.
 The Motor Club's Special House Dinner at 7.15 p.m.
 27th (Th.).—Mr. Mervyn O'Gorman at the R.A.C. on "Gear Transmission."

MARCH.

- 2nd (M.).—Annual meeting of the private members of the Auto Cycle Club at the Royal A.C., 7.30 p.m.
 5th (Th.).—Paper by Dr. W. Watson at the R.A.C.
 11th (W.).—Annual meeting of the Incorporated Institution of Automobile Engineers.
 11th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 12th (Th.).—Annual meeting of the Royal A.C.
 Annual dinner of the Royal A.C. at the Covent Garden Theatre.
 18th (W.).—Annual dinner of the A.A. at the Hotel Cecil, London.
 19th (Th.).—Monthly meeting of the General Committee of the Motor Union.
 21st (Saturday)—28th (S.).—
 CORDINGLEY'S THIRTEENTH INTERNATIONAL MOTOR-CAR EXHIBITION will be held at the Royal Agricultural Hall, London.
 21st (Sat.).—Annual general meeting of the Council of the Auto Cycle Union.
 29th (Sun.).—Opening Run of the Southend Motor Club to the White Hart Hotel, Witham.
 31st (Tu.).—Last day for receiving entries, at ordinary fees, for the International Touring Car Race.

APRIL.

- 11th (Sat.).—Annual Open Flexibility Contest of the Crystal Palace A.C.
 16th—20th.—Easter Tour of the Motor Cycling Club.
 18th and 20th.—First meeting of the Brooklands A.R.C. for 1908.

MAY.

- 1st (F.).—The Frome's Hill Climb of the Herefordshire A.C.—provisional.
 10th (Sun.).—Targa Florio Race.
 21st (Th.)—2 h Reliability Trial of the Irish A.C.
 25th.—Industrial Vehicle Competition of the A.C. de France.

JUNE.

- 5th—6th.—London-Edinburgh twenty-four hours' run of the Motor Cycling Club.
 8th (M.).—Cars competing in the International Touring Car Trial will arrive at the depot.
 Start of the International Touring Car Trial of the R.A.C.
 15th—19th.—Scottish Reliability Trial.

JULY.

- The Land's End to John o' Groat's Trial of the Auto C.C. will be held.
 25th (sat.).—Petrol Consumption Tests of the Motor Cycling Club.

CRYSTAL PALACE A.C. FLEXIBILITY EVENT.

THE first open event in which the car standards drawn up by the Society of Motor Manufacturers and Traders, adopted by the R.A.C., will be used is to take place under the auspices of the Crystal Palace A.C. on April 11th. The cars will be divided into five classes, according to the engine rating, not being greater than 6'4, 16, 25'8, 40 and 60. Entries accompanied by a fee must be made to the hon. secretary, Crystal Palace A.C., 35, Earlethorpe Road, Sydenham, on Tuesday, April 7th. The competitors will meet at the Crystal Palace on Saturday, each furnishing an observer, who will not, however, travel on his nominator's car. His duties will be to note every change of gear on the route to Bexhill and the time in seconds when such gear other than the top is used.

MR. CHARLES FRISWELL has arrived at Colombo on his return journey from Bombay, where he has been engaged in fixing up agencies for Standard cars.

CARBURATION, LTD., Byron House, 85, Fleet Street, E.C., proprietors of the G. & L. carburettor, have sent us a copy of an instructive pamphlet they have lately issued describing and illustrating it. The design is the outcome of a long and scientifically conducted test of carburettor action. There are numerous points in the G. & L. carburettor which are fully gone into in the pamphlet, which also includes instructions for fixing the apparatus.

THE EXPIRATION OF A TIME LIMIT.

BEFORE Mr. Justice Bray and a common jury, in the King's Bench Division, on the 13th inst., Miss Ada Hewlett, a dressmaker, living at Wimbledon, sued the London County Council for damage for injuries sustained and business lost as the result of being knocked down by a motor fire engine in the Westminster Bridge Road, on September 25th, 1906. The defence was that the action was not brought within six months, and therefore the defendants were not liable under the Public Authorities' Protection Act. The jury found for the plaintiff and awarded her £425 damages. His Lordship, however, gave judgment for the defendants, holding that their contention succeeded.

COMPANY NEWS.

DION DUNLOP MOTOR COMPANY.—£100. Agreement between W. H. White and R. Poole for acquisition of the right to use name of Dion Dunlop Motor Company, Limited (now being wound up). To take over an agency for sale of motor vehicles, &c.

PROVINCIAL MOTOR CAB COMPANY.—£303,000. To adopt an agreement with the United Investment Corporation, Limited, and to carry on the business of proprietors and manufacturers of, and dealers in motor-cabs, omnibuses, cars, carriages, vans, and other public or private conveyances, carriers of passengers and goods, garage keepers, &c.

PARK MOTOR CAB COMPANY.—£2,000. To give guarantees and act as surety in respect of the drivers of motor-cabs owned by Motor Cabs, Limited, and contracted to ultimately become property of such drivers on hire-purchase system, &c. 39, Gerrard Street, W.C.

MONTAGUE HAWNT AND CO.—Capital of £15,000. To acquire the business carried on at 136-142, Clerkenwell Road, London, and 56-8, Dudley Street, Birmingham, as Montague Hawnt and Co., together with the rights (subject to the obligations and liabilities of the vendor under an agreement dated October 2nd, 1907, between himself and J. Mason), to adopt an agreement with W. M. Hawnt.

STEPNEY SPARE MOTOR WHEEL, LTD.—The directors of this company have decided to pay an interim dividend for the six months to February 29th at the rate of 10 per cent. per annum, payable on March 7th.

POLICE TRAPS.

AT many of the familiar places on the Great North Road police traps have been revived lately.

THERE is a trap in the Portsmouth road, Putney. Motorists caught therein are given a chance of examining the stop watches used by their captors.

THERE is a police trap in the parish of Long Bennington, on the Great North Road, near Grantham.

BUSINESS NEWS.

MR. FRANK BOLTON, of Oakamoor, has placed an order with Ariel Motors, Ltd., for one of their 40-50-h.p. cars.

MESSRS. ALFRED HERBERT, LTD., of Coventry, send a copy of their new catalogues of horizontal and vertical milling machines.

MESSRS. BALDOCK AND CO., of Tamworth Road, Croydon, are letting motor-cars on hire.

MESSRS. W. PARKYN AND SONS, LTD., are specialising on motor-body building at Holmes Road, Kentish Town, N.W.

EVERYWHERE the 10-12-h.p. Coventry Humber is winning golden opinions. Writing from Oude Pekela (Holland), Mr. H. V. Russum states that his 10-12-h.p. vehicle has given him the highest satisfaction. "I have not had the slightest trouble with the car, the consumption is very small and the most pleasant feature is that the car runs so noiselessly. It took seven and a half hours from Amsterdam to Pekela via Amersfoort, Harderwijk, Zwolle, Mappel, Assen, Gieten and Stadskanaal."

Dr. MILSOM REES, of Upper Wimpole Street, London, W., has recently taken delivery of a 24-32-h.p. Porthos car.

MESSRS. G. W. HOUK, LTD., 46, Knightsbridge, S.W., have been appointed West End agents for Peugeot cars by Messrs. Friwell, Ltd.

MESSRS. MERO, LTD., of Sheffield, the patentees and makers of the Mero silent change-speed gears, have appointed Mr. J. H. Burgess, late with the Simms Weilbeck Company, their London agent. They have opened offices at No. 8, on the Mezzanine floor, Albion House, New Oxford Street, where they have a working model, while trial cars will be at the disposal of anyone who wishes to try the gear.

IN March of last year the Wick Nurseries Company, of Barton, Oxford, fern, plant and fruit growers, purchased a 2-ton 18-22-h.p. four-cylinder petrol motor lorry from the Argyll Company. Mr. H. Locke, the manager, informs us that "We are quite satisfied with the work the vehicle has done for us during the time we have had it; also that we have had very little trouble so far. As you are probably aware, we have some stiff hills in this district, but the lorry faces all quite comfortably with two tons up. We use it for transporting coke, manure, vegetables, plants, trees, &c.; in fact, whatever we have to haul about. When in full work the lorry does the work of six horses daily. A week's running was as fellows, for a two-ton load—240 miles, using 22 gals. of petrol, 6 gals. lubricating oil and 3 lbs. grease."
